I. As for the first, although the coming of the Vertigo, how cruel soever it seems, have for the most part no danger in it, and goes often off of it self, because the Patients think they will dye, and do desire the aid of Medicine in such a case, after a Clyster has been given, let Blood, if the Pulse indicate it. Then apply a blister to the Neck, and smell to strong things as Castor, spirit or volatil Salt of Harts-horn, Urine or Sal Ammoniac. These Spirits also may be given twice or thrice a day with a convenient dose of Cephalick decoction, at the hour of sleep take a bolus of Mithridate with powder of Castor. The next day, if the Disease be not gone, let him take a gentle Purge: Or, if the Patient be enclined or ease to vomit, let him take a Vomit, than which there is scarce a better Remedy. 2. And now we must consider, what must be done out of the Fit, for the cure of an inveterate and almost continual Vertigo. Therefore when I have put the Patient in a course of Bleeding and Purging according to his constitution and strength, it is my custom to advise him to take a Vomit once a Month, if nothing contra-indicate: For which end, the weaker sort, after they have stuffed their Stomachs, with slippery meats, may take 2 or 3 ounces of Wine or Oxymel of Squills, and afterwards drink store of Cardus posset drink, till they vomit. Others may take a Vomit of Salt of Vitriol or Sulphur of Antimony, or infusion of Crocus Metallorum. As for Issues, Blisters, Bleeding the Hæmorrhoids, Plasters or Caps for the Head; also Plasters to the Feet or Wrists, for revulsion or derivation sake, let the Physician consider whether they be needful. And because all things agree not with all People, the Physician must try divers Medicines, and various Methods, sometimes one sometimes another. The Vertiginous may drink for their ordinary drink small Ale with leaves of Mistletoe of an Appletree boyled in it instead of Hops: And in a 4 Gallon Runlet let a bag with half a pound of Peacock's dung and 3 drachms of Cloves bruised be hung in it.

II. Letting of Blood seems not proper, because the Disease may arise from vaporous and spirituous exhalations, which cloud Pallas her tower, and these cannot be evacuated by Bleeding: For Bleeding is rather proper in abundance of Blood, either in respect of the whole, in a Plethora, or of some part, in derivation and revulsion. And, the proximate cause of the Vertigo considered, there is rather need of such things as break wind, and prevent the breeding of it. For the decision we must consider, that in the cure of a Vertigo we must sometimes have respect to the antecedent cause, which by a certain continuity upholds the conjunct: Wherefore among other Remedies bleeding is prescribed by Aëtius, whether in the beginning or progress of the Disease, if nothing hinder it, especially where a bloody and hot matter gives original to those fuming exhalations, that cause the Vertigo. Galen. 4. de cat. 4. per v. f. 10. approves the same. A further limitation also may be here observed, which Heurnius sets; If, saith he, accustomed excretion grow slow, and the Disease encrease, as in suppression of Sweat and Blood, Blood may be let in the Arm. But you must not do this, when the Disease comes from cold, but where there is a Plethora, the Disease bad and the Age strong, a Vein may be opened, says Aëtius. We had last year an instance of good success in a Vertigo cured by Bleeding, that had long afflicted a principal Citizen, who was of

a hot constitution, but a weak head, who having been ill of a grievous Vertigo for several dayes by reason of vaporous and fuming Blood, after he had taken a gentle Clyster, and had in vain tried several proper Cephalicks, was at last by once bleeding immediately eased of that Symptome, that continually afflicted him. Yea, Paulus commends bleeding the Arteries about the Ears, when hot exhalations are conveyed by the Arteries in great store to the Brain: Instead of which Remedy they have now found a better, which is, a Cautey, either

Horstius

actual or potential, about the coronal Suture. III. Although some disswade Bleeding in the time of the Fit, lest strength, which is then low, should be further weakened, yet if the Vertigo be long and violent, and the constitution of the Patient such, that he must of necessity be bled, lest an Apoplexy seize him; and if there be imminent danger of an Apoplexy, there is no reason why Bleeding may not be allowed of, if there be Ind-

Sennertus

cants, that require it. IV. Bleeding in the humerary Vein is proper in Plethorick Persons, not only if the source of the Disease lye in the Blood, but also if there be either too much or spirituous Blood in the Head, which occasions the Vertigo: For seeing the Blood both of the Arteries and the Veins is confounded in the Sinuses of the Brain, if a Vein be but opened, spirituous Blood will come out; in which if the mischief lye, the main end of cure consists in bleeding. And for this reason they advise Bleeding in the Jugulars. Yea, many teach, that if Spirituous Blood cause the Vertigo, it cannot be cured, except the Arteries behind the Ears be opened: and this sort of Remedy has proved well upon experience, when all others have been tried in vain: Yet we must not do this, till we have tried all other wayes, and are certain of the cause, and know by the continual beating of the Arteries, that it comes from spirituous Blood. A Vein also may be opened in the Forehead, if it come from this cause, and in the Foot, if Vapors ascend from thence. And if the Menses be suppressed, the Saphena, especially if the cause, that sends the Vapours upwards, lye about the Veins of the Womb. Upon which account, the Hæmorrhoids also may very well be provoked, if the cause of the Disease lye in the Mefaricks.

Platerus

V. If neither Bleeding in the greater Veins, nor in the wrist, nor in the Hæmorrhoids, nor Cupping will do you good, especially if you have tried them often, and if you have used Purges, stronger and weaker; you must then without doubt have recourse to sweating with Guaiacum, China, &c. especially if there be any suspicion of the Pox. But if these neither will do any good, then necessity puts us on two sorts of Remedies, the first whereof intercepts the passages, by which any thing is transmitted either from the whole Body or from any part of it, to the Brain. And this comprehends the cutting of the Arteries behind the Ears, celebrated among the Antients, which they valued so much. Which Remedy, besides that it is suspected for Barrenness (if we may believe Hippocrates) and to cut an Artery any where is not without danger; Besides also, if they may safely either be cut or burnt, we cannot therefore think, that all the wayes, whereby the Head receives, are stopt presently, since often the mischief gets into the Head by the internal Vessels, which can neither be burnt nor cut. Wherefore it were a madness to try a doubtful and suspected Remedy, which is more dangerous than the pre-existent Ail. But where the Illness is extreme, I should rather venture to burn the Veins of the Forehead and Temples by a Skilful hand. If you dare not venture on this, you may betake your self to the second sort of Remedies, which is, if the Veins be very turgid in the Head, to empty the fulness of the Head, by Bleed-

M m m

in

Mareseus.

ding under the Tongue. ¶ But if any one intend to abate the fullness of the Head, omitting doubtful Remedies, it is better to open the Jugulars, which is a present Remedy, and without danger.

Sylvaticus.

VI. Arteriotomy is propounded by Galen and other Græcians, Arabians, and Latins, made either behind the Ears, as Galen advises, or in the temporal Artery, that is most tumid and beats most. Now, an Artery is cut either in the same manner, as a Vein, only for evacuation of the hot Blood, as Parezus advises, whose counsel I have followed in this operation in other cases, with success: Or it is cut deep, and quite through transverse, so that the ends of the Arteries may contract themselves and close up, whereupon no great effusion of Blood follows. This operation more certainly intercepts evaporation, by coalescence, not by obstruction of the Arteries. Although it be a question, whether this transverse section stops the flux of the matter, since a hot evaporation is made by the Arteries, internal and external, right and left. Wherefore perhaps the interception would be greater, if strong Astringents were frequently applied to the carotid and temporal Arteries. But the transverse section is now usual at Milan.

VII. There are not wanting some, who advise to burn the Head in several places with an hot Iron, which indeed is less suspicious, especially where the case is desperate. Instead of which, our Art has found a Remedy of no less moment, and much safer, namely an Issue behind in the Head, or a Section there. Which Remedy though it be very effectual in this evil, yet it should only be used, by them, whom the Vertigo casts down, and makes fall in the Fit. For seeing it is certain that the Ail is communicated to the hinder Ventricles of the Brain; it may be feared, that the Patient might fall into an Apoplexy, Epilepsy, or at least a Palsie. But when all the Illness consists only in a Vertiginous circumvolution, or dimness of sight, a sign indeed of hurt in the fore parts of the Brain, I think it far better to make an Issue in the Arm, or a Section thereabout. But if it so happen, that the Liver, Womb, or Hæmorrhoids are stoppt, or any other evacuation by Ulcer or Fistula (which often happens) be suppressed; also when any swelling in the Lower Parts falls; without doubt I think it necessary, either to recall the former fluxion; or instead of it, to open an Issue in the Leg, by which Nature may transmit what she used to expel other ways.

Mercatus.

VIII. Beside other Remedies, I have observed, Issues made in the Legs have done much good. And though they be properly convenient where the Vertigo comes from the Spleen, Liver or Womb; yet I have likewise observed, that Issues in one or both Legs have done a great deal of good, when it comes from the Stomach.

Mercurialis.

IX. That Vertiginous Persons should be purged, especially upwards, is proved from 4. aph. 17. and lib. de affect. n. 2. But if pain and the Vertigo, sometimes the one, sometimes the other, come upon the Head, indeed these things used do good, that is, the Remedies prescribed, among which Purging of the Head is reckoned. He confirms this lib. de veratri usu: This opinion may be proved from 18. sect. 4. aphor. and from Reason; because if the Vertigo arise from bile floating upon the Stomach, without doubt it must be excluded. But Hippocrates 1. Prorhet. num. 9. excludes the Vertiginous from Purging. They that Vomit black matter, loath their meat, are delirious, pained about their pubes, who have a fierce or closed Eye, purging Physick must not be given to them; for it is pernicious; nor to such as are swollen or vertiginous. Dimecles 5. Epid. 80. having the Vertigo, was not purged nevertheless. If the Vertigo arise from a weakness in the Head, it will be made worse by purging: If from a mass of Humours in the Brain, they will be more disturbed, whence the Vertigo will increase. Besides, in an acute Fever a Vertigo often

comes from the concurrence of Blood, critical or symptomatical, but this is cured by Hæmorrhagy, not by purging. This may be reconciled, considering that Hippocrates 4. aph. 17. speaks of a Vertigo, a stranger, coming from bile floating on the Stomach, which cannot be discharged but by Vomiting, as the Stomach is next to it, and it has a tendency that way. And that he speaks of a Vertigo coming from that cause, the Diseases joyned there do shew. And an inbred Vertigo proceeding from a Malignant Cacochymy in the Brain, without doubt requires purging, not by emetics, because vomiting fills the Head, but downwards: for the foul Humours being carried off, whereby the animal Spirits are disturbed, the Vertigo also will cease; because, when the matter is discharged, no more caliginous Spirit will be bred. But a Vertigo that has neither a Plethory nor a Cacochymy for its cause, but a fixt and bad disposition in the Brain, will not give way to purging, but only to Alteration: The place quoted out of Prorhet. must be understood of this; though Galen in his commentaries thinks it is only prohibited by weakness. What if we say, that Hippocrates in that place judges, the Vertiginous should not be purged, because of a concurrence of Symptoms attending? For he says, Neither the Vertiginous, nor swollen, nor that cannot walk, nor loathing their food, nor discoloured. For it is clear, that such are very ill, and cannot bear Purging. Lastly a Vertigo, that is the effect of a weakened Brain, and of exhausted Spirits, such as befalls new married People, requires only Restoratives, not further evacuation.

Sinibaldi, Antiph. pag. 174.

X. Strong Purges must wholly be avoided, for they heat too much, and cause vertiginous motions in such as are not subject to them.

Crucius, de Quasitis.

XI. Vomits often do good: for besides Authors testimonies, it appears from common experience. And moreover because the vertiginous do often vomit, hereupon many have grounded an opinion, that the cause of this Disease does almost ever lye in the Stomach. Now, the reason why Emetics do good in this Disease, is, because by this sort of Physick, there is both a great revulsion made of the Humours in the Brain, and the disturbed Spirits are soon composed. When the Membranes and Fibres of the Stomach and Parts thereabout are velleated, divers Humours, that is, the Nervous, Serous, Lymphatick, Pancreatick, and Bilious are drawn to those Parts, and so carried off, so that the Brain is free from the afflux of them, and easily discharges many that were settled there already.

willis.

XII. After universal evacuations we may proceed to particular ones of the Head by Sternutories, Errhina, Masticatories and Apophlegmatisms. Errhina indeed are suspected by some, for they fear, lest by that motion the Humours and Spirits in the Brain be more disturbed, and so a Vertigo be caused, but if convenient evacuations of the Head have preceded, we need fear no such thing.

Sennertus.

XIII. In a Vertigo if fumes be observed to ascend by the outer Vessels, Repellents have place; but if they ascend by the inner, they are so far from doing good, that they do hurt, seeing they do not repress fumes, but retain them there when ascended. The case is the same in the Head-ach.

Frid. Hoffmannus.

XIV. If the Vertigo arise from turning the Body round to the right or to the left, the turning the contrary way cures it soonest: In which lying on ones back is good. But if it come from an internal cause or from Drunkenness, this causes it.

Platerus.

Medicines especially made use of by eminent Physicians.

Donatus ab Altomari. 1. This is a most effectual Remedy in a Vertigo by Sympathy, if Southernwood powdered be drunk in Wine warm, or with Oxy-mel that is not sharp, as Marcellus sayes.

Rod. à Fonteca. 2. Oyl of Box, as in the epilepsy, so in the Vertigo is reckoned an excellent Medicine inwardly and outwardly, anoynting the Arteries of the Temples, behind the Ears, and at the Wrists, and the Soles of the Feet: Inwardly thus; Take of Conserve of Rosemary flowers 4 ounces, Oyl of Box, Nutmeg, Mint each half a drachm, with Syrup of Citron rind make an Electuary. The Dose half a drachm; yea, if 8 or 9 drops of Oyl of Box be given with three ounces of Pæony water, he will find no better Remedy.

F. Hofmannus. 3. Three drachms of Seed of Columbine is good in a Vertigo.

4. Van Helmont sayes he cured himself of a Vertigo with Sulphur of Vitriol.

Mercatus. 5. Silk worms dried and powdered, and strewed on the Head, wonderfully strengthen the Head in a Vertigo.

Mercurialis. 6. Marcellus has a Medicine, which I have experienced; Take Myſi and beat it to powder, steep it in Vinegar, and so steeped apply it in manner of a Cataplasim to the Temples and behind the Ears: for it has an excellent virtue to disperse Vapors, which cause a Vertigo.

Eustachius Rhodius. 7. Some say, that the juice of black Betes, applied to the Temples, quickly cures a Vertigo.

8. In a Vertigo by Sympathy coming from an hot cause this is a most excellent Remedy; Take of Fumitory 1 handful, Dodder of Time 8 drachms, Myrobalans citrine 2 drachms, pulp of Tamarinds 1 drachm, Endive, Cichory, Purslain each 1 handful, Raisins 6 drachms, let them boyl in a sufficient quantity of water; to the expression add of juice of Quinces, juice of unripe Grapes each 3 ounces, pulp of Damascens boyled in the former decoction, and passed through a sieve, 1 pound. Let them boyl to a moderate consistency; then add of Cassia new drawn 6 ounces, pulp of Tamarinds 3 ounces, Species ditragacanth. Santal. each half a drachm, Sugar what is sufficient. Mix them and make an Electuary. The Dose from half an ounce to 6 drachms, every or every other day before Supper. ¶ In a Vertigo caused by obstructions of the Brain this is an effectual Remedy; Take of powder of Staves-acre, 8 grains, Myſi 1 drachm Pellitory, of Spain 1 scruple, yellow Wax 1 ounce, a little Sugar. Make it into a Masticatory.

Medicines.

I. Galen is reprehended by some, because 7. method. cap. ult. he says, that the Bladder is purged by the Guts, if it be full of Humours; For, say they, what other way is there from the Bladder to the Guts, than by the Ureters, Kidneys, and a thousand Mæanders in the Veins? But it were ridiculous, to imagine purging by so many turnings, and to leave the freight and common way. Yet let not Galen be blamed, who several times opens the causes of this transfusion, and commends Hippocrates his judgment, That all things have a common conflux and transpiration. Do you think that the distribution of the Aliment is made only by wayes conspicuous. But there are many parts which have no conspicuous wayes to them. If any part be starved, it snatches what it can get, the Veins from the Arteries, and these from the Veins, by sweating through the pores of the Veins, therefore the Guts may take from the Bladder, and it from them. When any part has a Humour fell into it, out of pain or weakness, does it not receive excrements from every hand? In a Looseness of the Guts is it safe for the Bladder to abound with excrements, which cannot commodiously be purged by their own way? I think not, for when this way is stoppt, they might come violently upon the Guts. But if upon these occasions something may be transfused out of the Bladder into the Guts, why may not something far more easily be drawn by the strength of the Medicine, through the pores of the coats? Galen. 1. de fac. nat. sayes, that if an earthen Vessel full of water be set in a heap of Wheat, the Vessel will be drawn dry, and so bulk and weight will be added to the Wheat, and this is done by the Wheat's drawing the moisture through the thick Vessel. And how much a more powerful attractive vertue, in all probability, is there in Physick, than in Wheat? And how much more convenient is the Coat of the Bladder for transfusion, than an earthen Vessel? Which if it have nothing else, it has wayes of drawing nutriment, which very same ways may serve to draw a Medicine. Wherefore by what ways the Bladder receives nourishment, by the same it may remit the excrements wherewith it abounds. But the Bladder does not receive nourishment by the Ureters, which only carry Serum, but by Veins and Arteries. And if it be difficult to you, how the juice, that is extravasated in any cavity, should be resumed into the Vessels; I suppose it has not been your fortune as it was Galen's, to cure the jaundice with once purging, or to evacuate the water between the Peritonæum and the Guts, by stool.

II. From one that was ill of an Inflammation in his Bladder I immediately took 3 ounces of very foul Blood from his right foot. I bled him in the foot, both because he had been let Blood in the Arm formerly for an Ague; and also because Galen in several places orders Bleeding, for parts ill above the Kidneys in the Arms; for the parts below the Kidneys in the foot. You will ask, whether must we always let Blood in the foot for parts below? I answer, that when the body is very plethorick and strong, and in the beginning of an Inflammation, it is no absurdity to bleed in the Arm, and then presently the same day in the foot: for although Bleeding in the Arm be a great revulsive, yet because it does it but slowly, for it is far from the place affected, therefore I advise to let Blood first in the Arm and then the same day in the foot. ¶ Riverius first orders the Basilic Vein to be opened twice, thrice, four times, or oftner, if there be strength sufficient, till the fluxion cease, which is known by the abating of the pain: this revulsion being made, he will have the lower Veins opened also for derivation. ¶ Walæus meth. med. 98. agrees with Ferdinandus. In what place, saith he, must we bleed for revulsion sake, whether near, or at a distance? My opinion is, when the part affected is above the

M m m m 2

Heart,

Heart, it is convenient to bleed an upper Vein; but if the place be below the Heart, open a Vein below.

III. In an Inflammation of the Bladder *Alimarus* and *Mercatus*, after Bleeding and Fomentations, if they be not sufficient, order a Cupping-glass with Scarification to be applied to the region of the *Pubes*. *Salvus* contradicts this, fearing lest the Inflammation should be thereby exasperated. But he need not fear it, other things as well universals as topicks being premised: For the matter being softened and prepared, is by this means diminished by derivation.

IV. In Ulcers of the Bladder injections must not only be made by a Syringe, as is done commonly; but a Catheter must be put into the Bladder, and the Syringe, must be fitted, so the Injection is carried to the part affected.

V. Injections, to dry up Ulcers must be made of driers with little attrition: For things too astrigent, stop the Urine, which causes much pain: Seeing a sharp Urine, when it comes through a narrow passage, causes more pain, than if it came through a larger.

VI. An injection of a decoction of Comfrey roots is proper in this Disease, because it heals, and has a certain Mucilage, which is necessary to make the Medicine stick, and mollifie the asperity of the part; Horse-tail, Plantain, Ceterach may be added, for it dries much; St. Johns wort, especially in the Stone with an Ulcer in the Bladder because it breaks the Stone, and heals the Ulcer. Litharge powdered and boyled a good while, and strained through a filtre is good. Things also may be added, which are reckoned to heal the Nerves, because it is a part more Nervous than Carnous: Root of *Narcissus* is good, because of its Mucilage. Trochicks must be finely ground, as for Collyries.

VII. A Woman, who was troubled with a foul and sharp Ulcer in her Bladder, when *Cyprus Turpentine*, *lignum nephriticum*, Steel, and other drying and cleansing things would do no good, betook her self to the Spaw waters, by continual taking of which, she overcame the deplorable Ulcer.

VIII. I much question, whether there be any hope of curing an Ulcer in the Kidneys: I do not remember that either I or any body else ever cured one. Yet something may be used to give ease and keep it from growing worse: for which purpose I find nothing better than Balsame of Sulphur, as well *anisatus*, as *succinatus*, *juniperinus*, and *terebinthinus*; by which, although their strength be much wasted, before they come to the Kidneys, yet the Breeding of much pus is hindered, and the encrease of the Ulcer is stopt. The same may be said in the Ulcer of the Bladder, in which case *Balsamus Sulphuris anisatus* does Wonders: And there is more hope here, because it may immediately be injected into the Bladder.

Medicines especially made use of by eminent Physicians.

1. When the Inflammation is laid, if it be exulcerated or there be Pustules, it may be cleansed with half a pound of Hydromel, with 2 ounces of juice of Smallage: with 1 drachm of Myrrhe powdered: for this is an excellent cleansing Medicine.

2. A decoction of Strawberry leaves drunk, will ease the most violent pain of an Ulcer in the Bladder.

3. *Terra sigillata* or Bole Armenick taken in Milk of Almonds or their Oyl, or in Asles or Goats milk, is a peculiar Remedy: for it purges the Poyson, and dries the part, and the Ulcer without

pain, and stops blood, if the Ulcer come from *Can. Nic. Pifo. tharides*.

4. Liqueurish taken any way is wonderful good in Ulcers or Excoriations of the Bladder; for it cleanses, dries moderately, heals, and tempers the Solenander. Acrimony of the Humours.

5. Take of the Seeds of *Alkekengi* 3 drachms, seeds of Citron, Cucumber, Gourd each 3 drachms and an half, bole Armenick, Frankincense, Dragons Blood, white Poppy seeds, bitter Almonds, juice of Liqueurish, bark of the Frankincense Tree each equal parts finely powdered: let them be mixt a long time with the white of an Egg in a leaden Mortar with a leaden Pestil, let it be injected with a Syringe.

6. Two scruples or 1 drachm of Trochicks of *Alkekengi* in Eadive water heal Ulcers in the Kidneys and Bladder admirably. Chr. a Vega.

7. For a scab in the Bladder; The drinking and injection into the Bladder, of Whey, especially if Mastic tree, Scabious, Pomegranate Peel, or Plantain, have been infused or boyled therein. Mercurialis.

Medicines.

I. Since for the most part Bathes consist of Sulphur, Alum, Vitriol, Iron, Copper and other Metals, which cleanse and dry extremely, and therefore are used with success in Ulcers, Itch, &c. at last they are abused, so that they are usually the extremest refuge in desperate cases: But it often happens, that when diseased Persons are sent hither without any regard had to the Patient or his Disease, their end is hastened. I have seen it several times, especially in a Matron of seventy, who had been several years ill of a painful and contumacious Ulcer, with a perishing of the Bone, about the juncture of her left Foot; wherefore she went to *Neubausen* Bathes near *Berne*, and found benefit; for her pain abated, and the Ulcer healed up. Yet not long after she grew ill again, and her Ulcer broke a new: The next year she used them again; but then she was taken with a dangerous Fever, wherefore I advised her for the future to abstain from the Bathes, but to no purpose; for she went again to the Bathes at *Blumenstein*, which she had no sooner entered, but she was so weak, that she scarce could recover it. Do you ask the Reason? The putrid matter, that is in the muscular parts about the Ulcer or in the Bone, grows hot with the heat of the Bath, becomes sharp, acquires a Malignity, and makes the Ulcer more painful. Wherefore Humours flow continually from the whole to the part affected, and with the rest of the foresaid Humours, inclosed in the part, do corrupt. Besides, the matter grows hot in the Vessels, which the heat of the Bath, turns into Vapors, which go to the Liver, Heart, and Brain, whence proceeds an Infection of all the Spirits, and other grievous Symptoms.

II. Beware, that you do not take all that *Crollius* has told of his *Lapis Medicamentosus* for oracle, For sometimes a Theorist writes many things with a feather of *Icarus*, and extols them to the Sky, which when they touch the Sun of experience, melt and turn to nothing. If you examine the ingredients of this Stone, you will find it hot and dry, with great acrimony: Nor can I see, how it should possess those innumerable virtues, *Crollius* ascribes to it, and how it can be applied in so many Diseases without damage. He writes, that it cures all Ulcers in the exterior parts quickly: But have a care, you do not try it in Ulcers of the Nervous parts, that are full of pain and Inflammation, especially in delicate, bilious and cacochymick Bodies: for it immediately causes pain, inflammation, watching, inquiet, and other Symptoms. I saw this formerly in a young Man, who I remember upon the application of it, after a violent pain fell into a Swoon. Have a care also, that you do not apply it in cancers or cancerous Ulcers of any part; for you will immediately find the ail grow worse.

III. Aluminous water also is suspected in cancerous Ulcers. *M. N.* was ill of an Ulcer at the root of

his Tongue, of a cancerous nature: It was exasperated by the application of the said water prescribed by a Physician. Wherefore I persuaded him to wash his Mouth with water of Frogs, Craw-fish and Plantain with Honey of Roses, and to strow powder of Frogs and Craw-fish burnt upon the Ulcer: after this the Malignity of the Ulcer abated quickly, to the admiration of them all. *Idem.*

IV. Ulcers, seeing they have cacochymie, and faults in the Humours for their causes, do also require purging; therefore *Hippocrates* seeing, and well considering the necessity of it in this case, mentions it *lib. de Ulcer.* which he uses not to do in other such cases. We have two sorts of purges in Ulcers, and other external Ails, the one Catholick, drawing from the whole Body, which we seldom use; the other contrary to this, which draws neither from the whole Body, nor all Humours. Each of them must be used with great care always. The former indeed is more simple, because of more frequent use: the latter more compound, because it is given for compound diseases. This is commonly threefold, Purging of Phlegm, Choler, or Melancholy. But we propound another, both absolutely necessary and especially for our purpose, which is properly the purging of the Blood by its repeated use. This is not only omitted, but seems not so much as to be known by its name. The Blood has 4 *Hypotheses*, of different natures that is, bile, phlegm, and melancholy; and Blood, in all mens judgment, is the legitimate Humour, the fourth substance of the mass, the purest part of the nutrient Humours: Now every one of these distinctly taken has its peculiar *Ichores*, that is, moist superfluities depending on them. When *Ichores* and Humours may corrupt and putrefy contrary to Nature's law, both jointly and severally; of which there is a numerous conjugation. Therefore either all the Blood and Ichors and Humours are in fault (as in the small Pox and Leprosy) and with some of these, as in lesser Cacochymies: Or all the Blood is polluted, absolutely, as much as it can be, as in the small-Pox and Measles. Although we ought to restore and correct all these Modes, of putrid Blood with Physick: yet this Mode of Corruption especially comes under our consideration which is not in a total and perfect corruption. Blood therefore recedes from its nature two ways, either the most part of it or but a little. But the farther the recedes is, the greater industry and stronger Medicines are required: And the measure of the Putrefaction can be no way better known than by observation of the Blood, as it is drawn out of the Veins: Or, if we cannot do that, from the discolouring, especially of the Eyes, Lips, Gums, Teeth, Hair, Nails, also from their strength especially compared with their feeding or fasting, from the quality of the excrements, and other affections appearing in the body. When you have searched out these things, then you must proceed to make up proper Medicines, which may purge the Blood several ways, by absterging, opening obstructions, ventilating, provoking Sweat and Urine, by giving a stool, by attenuating and qualifying their second or third qualities. But among all things they are chief, which act by peculiar property. Among purgers, the chief is Hellebore, either black or white, which *Hippocrates* therefore used so much, because he knew it had a singular faculty, to purge the Blood: Nor need we be so abhorrent from this Medicine, nor be so fearfull, because the Diseases wherein they are used are more frightfull, and proceed from black Choler: wherefore *Galen lib. de atra bile* writes, That in Diseases proceeding from a melancholick Humour, you must at the very first stop the growth of it by Melanagogues. As for the safe preparation of it, see *Salvus l. de Aff. part. cap. 19.* and others. Also *Sen-na*, *Coloquintida* and *Turpeth* are strong; weaker than

Hildanus, Cent. 5. Obs. 90.

Idem. Obs. 91.

than these are dodder of Time, root of Fern, Fumitory, Hops, Agrimony, Cichory, Ground pine, Speedwell, Strawberry leaves, Maiden-hair, Asparagus, Parsley, which according to *Montuus*, Purges the Blood by Urine. Among Compounds Treacle is the chief, which by reason of the Viper, it has in it, has the divine faculty of Purging the blood and humors, Trochises and Salts of Vipers; and infinite things out of *Hermes* his Laboratory. To which you may reckon preparations of Antimony, whose virtue, as it is admirable in separating all Metals, so its faculty is observed to be the same in Purging all corrupt humors, as *Quercetan* has observed. Among other cathartick forms of it, *Platerus* in several places of his *Praxis* commends the calcination of it: He tells of a certain Empirick, who for breakings out of salt Humors, filthy Itches, and tedious and pertinacious Diseases; mixt calcined *Stibium* in a Decoction of *Sassa parilla*, and did admirable things.

Severinus.

V. The edges of Ulcers, difficult to cure, must be taken greater care of, than the middle; for the fault always comes from the upper and higher Parts, and there also it begins first to heal: Which edges, if they be exasperated, and cut out (according to *Hippocrates* his rule *l. de loc.* We must first make old Diseases new) it is consentaneous to reason, that the fore abate forthwith, when the virulent and bad blood, which fed and made the fore worse, is gone. And it has in very deed been found, that it abates just as Plants, when the moisture is withdrawn, do wither. And so they that have Ulcers, and are daily under my Cure, do confess to me, that they find, they are eased of their old pain, and are bravely relieved.

Idem.

VI. Simple Dysepulotick Ulcers (that is, such as are difficult to heal up) if when you have tried all Medicines, (if the Ulcers come not from a Rheum) you can do no good, they must be conquered by fire. This is my invention, by Spirit of Wine, which in tenuity of substance, and aptness to take fire is most proper; a Linen, Tow, or Cotton, dipt in this, and set on fire as far as the Ulcer goes, will quickly turn and draw out the mischief by its gentle motion; if once be not enough, you may do it three or four times, or as often as you please. If you have any delicate Person under Cure, you may put a linen cloth underneath, spread with killed Mercury, the Mercury side to the Ulcer, so as to touch it, and having applied this, lay on another and give fire to it: It is certain, that those who have great sores, will bear this often, and with patience. Sometimes I have filled pipes of brass or reed with hot Embers, and rowled them athwart the ulcerous Parts; and so I have burnt and cured those sores, which would not give way to any of the strongest Medicines. In the same manner also you may treat all intemperate Ulcers and such as run a thin *Ichor* and sharp *Sanies*. But there is no need of fire for such as are dry and squalid. One who had been laid up ten Years of such an Ulcer, was burnt by me first with an Iron unknown, and sometimes with hot water, and was cured in 40 Days. *M.N.* had a carcinomatous Ulcer athwart his Tongue obliquely, which much afflicted him on the upper part of it; I applied a Silver spoon heated in the Fire to it, upon which he was free of his pain, and could speak freely, as though he had been cut for the Tongue-ty, which before he could not do. Wherefore having found out this Remedy, I invented a particular Instrument to heat the Tongue conveniently. And all the help, that accreus to Ulcers, which would otherwise eat through or off the Parts, is because nothing comes nearer, to the innate heat, which governs the Economy of the Body, than this external heat. *Aph. 5. 22.* *Hippocrates* also testifies there, that it is good for Diseases coming of hot Causes, that is, for eating *herpetes*, which proceed from a bilious and hot Humor.

Idem.

VII. Sometimes a Spontaneous Ulcer arises in the empty spaces between the Muscles, and in the cavities of the other Parts, which has cured some other more grievous Disease in the Body. Therefore an outlet must be left there for some time. I indeed advise you to it, because I have often found it a thing conducive; and reason persuades the same.

Idem.

VIII. A man of sixty, a great drinker, whose Face was all Sauce-phlegmed, had a Pustule arose in the upper part of his Chin, covered with a thick Scab, at first about the bigness of a large Pea, increasing more and more every day, and spreading to the middle of his Chin, very painful, ouzing out in several places at little Pores, a very sharp bilious Ichor. Because of the great store of cacochymy in this intemperate Man, and the sponginess of the part affected, some feared, lest in tract of time it should turn to a cancerous Ulcer. The suspicion encreased, because, when it was anointed with a Balsame, that had done much good in others it grew worse in a moment. The cause whereof I thought might be, for that all the Ingredients of the Balsame applied, were sulphureous, and so further exasperated the enraged, bilious, sharp Ichor. Wherefore I thought of checking it with Acids, and not without success: For *Sal prunella* being dissolved in the white of an Egg, and linen clothes dipt therein, and applied often in the day, the Pustule in five days time vanished, leaving no Scar behind it.

Thiermair.
Conf. 9. l. 2.

IX. I have often with admiration considered the incredible effect of *Balsamus sulphuris anisatus, terebinth-natus, &c.* in the cleansing and healing of Ulcers, if a little of it be dropt into the Ulcer, for the generation of new pus is presently so abated, that oftentimes by the help of this Balsame alone they have been cured in a few days, in the Breasts, and in other parts, after inflammations and notable imposthumes. From this experiment I reckoned, that the cleansing and healing of Ulcers, which follow imposthumes, consists in the correction of the Acid and Corroding Pus, which sticks to the Ulcerated part, and corrupts and turns into new pus, in some measure at least, the Blood designed to nourish that Part: And that the Pus is corrected by the Balsame of Sulphur, especially upon account of the aromatick Oyl, which abounds with an oylly volatil Salt, whereby the acid Spirit that abounds in the Pus, and corrupts the blood every day into Pus, is not only made dull, but so sweetened and amended, that the affluent blood quickly repairs the Parts formerly consumed, and perfectly heals them up.

Sylvius de le
Boë.

X. A Medico-Chirurgion had a Matron under Cure, who had contracted a *Fistula* in her Leg after an imposthume, which he had had six Months under Cure. At length when *M. J. Griffonius* had searched it with a Probe, and knew the only cause which hindered the healing of it up, was the thinness of the Skin, covering the Ulcer, he quickly put her in heart. Therefore, when her Body was Purged and prepared, he eroded the thin Skin with a caustick, and of a *Fistula* made an oblong Ulcer; after the fall of the Eschar, and the Ulcer was cleansed with ointment of juice of Smallage, in three Weeks or a Months time he successfully cured it.

Hildanus
cent. 5. obs.
79.

XI. I have more than once seen upon the Plasters of fistulous Ulcers, little Animals, like waxen Mites, whereof not only the figure but the motion might be seen: Thus we are held of many Diseases, which come from invisible Animals, such as are those called *Cyrenes*, the Itch, Ring-worm, &c. as may be perceived by Microscopes. But to cure Diseases coming from Animals, which always are attended with an Itch, Aloes and Mercury mixt with Butter must be used. The Famous *Dr. de Mayerne* observed in the cancerous Breast of a Woman, that was cut, thousands of Worms, Thence perhaps it

is,

is, That the progress of the corrosion in a Cancer is stop'd by applying the flesh of a Chicken, to which these Animals stick, leaving that which is worse and not so sweet.

Barbette. XII. When the coat, that covers the Glands, is either corroded or cut, the skin cannot be healed, till the Gland and Skin with all be consumed with the Ulcer.

Idem. XIII. If eating Medicines cure not the Ulcers in the Glands in a few Weeks time, we must know, that there is no hope remaining of a good Cure, because of the continual afflux of humors. And this is the reason, why we are often forced to cut them out.

Idem. XIV. In the cure of an eating and Malignant Ulcer we must observe, 1. That Medicines must be changed every 3 or 4 days, for Nature uses to refuse the best things, if they be often applied. 2. You must not open it above once or twice aday at most, unless the matter be too sharp, for otherwise, the Medicines will not sufficiently perform their operation. 3. Repellent and Mercurial Medicines must not be used in this case, unless you keep the body continually Purging. 4. These Sores can seldom be cured perfectly, without taking Purges, and drying decoctions of China, Guaiacum and the like.

Riverius, Cent. 1. Obs. 212. XV. A Woman of sixty had an Ulcer in her leg as broad as the Palm of ones hand, livid and foul, having hard flesh, deprived of all sense, so that it might be cut without pain, which proceeded from an Atrabilarious humour, burning the substance of the Part. Having put her in a cooling and moistning course of Diet for several days, she took once a Week a loosning Pilsan, she had a Semicupe to correct the Intemperature of her Bowels. Red Mercury Precipitate was applied to the Part, to eat away the dead flesh, and having made a pretty deep eschar, Emplastrum Sticticum Crellii was applied to the Ulcer; by the benefit whereof in a Month it was filled with Flesh, and brought to a Cicatrice.

Idem. XVI. It often happens, that when much humors run to the Gout, the Veins in the Legs are distended, not without redness and swelling all about. Platerus pr. med. p. 717. approves of cutting them out, in the same manner as is most usual in varices: For by the same means it may come to pass, that when much blood is intercepted, which used to run to the Part, it ceases; Only this is required, that the Veins appear high, because of the quantity of Humors, and not lie hid and obscure, so as the Flesh must be cut out with them. And know, Reader, That this cutting out of the Veins has ever been found by me, to be good for drying up and putting an end to old spreading Ulcers; Only have a care that a gathering and swelling do not rise, therefore the end of the lower Vessel must first be well squeezed out, and then it must be treated with driers and such things as strengthen the nature of the Part. And it will not be amiss to use restringents, till the humor leave off flowing thither.

Idem. XVII. Cutting out is due to putrid Ulcers, as a thing necessary above all things, that the sore may not spread infinitely. For as the rottenness in an Apple, if as soon as it is known, it be carefully cut away, goes no farther, but if it be let alone, it rots all: So an Ulcer, if what is putridified be cut away, it heals and is at an end; but if that remain, it eats and dissolves whatever is whole.

Idem. XVIII. Some Ulcers, though they do not appear such outwardly, nevertheless you may know them. 1. In that they have changed their natural colour into a very strange one, they are generally black or livid. 2. They have a great number of Pusules upon them like Caruncles, with little holes in them, and you cannot tell whether to call

them Tumors or Ulcers. 3. Many and the most efficacious Medicines do no good. 4. There is a certain pricking pain here and there in them, and the effect shews the sore to be abundantly worse, than it any way appears to be. I remember I once cured such an Ulcer, which I could never have conquered with the best Medicines, had I not cut it out. When it was opened, putrid and pallid Caruncles appeared, the skin lying false upon them.

Idem. XIX. A Girl above five years old had white, hard swellings prominent up and down the Body: They continued for a month or two: Divers Medicines are made use of, by which at length they are softned, and turn into Impothumes, for curing of which several Medicines were used, but in vain; for the Ulcers not only grew greater, but increased in number. A Physician being called, first Purged her, and then gave her a decoction of the Woods for above two Months: Proper externals were also applied, whereby it was effected that one or two of the Impothumes promised a Cure, yet a new swelling arose somewhere else, which turned also into an Ulcer. This Cure was so long continued, till the Eyes first swelled and ran, and then, and afterwards threatned blindness. When the Eyes were cured, the Ulcers, that before were healed, opened again; and when the Ulcers were healed, the Eyes began to be ill. At length they left off all Physick; and the making of an Issue in the left Shoulder, did so much good in process of time, that the Maid recovered perfectly of her Ulcers and sore Eyes, the Issue running store of serous humors.

Idem. XX. If the lips of the Ulcer be hard and callous, and the hardness will not give way to emollient and discutient Medicines, Galen 4. meth. cap. 2. Shows in what manner such an Ulcer must be cured; When only the lips of an Ulcer are discoloured and over hard, they must be cut away as far as the hard flesh goes; But when such a sore is gone far, the question is, whether all that appears preternatural must be cut off, or time must be allowed to cure it. Without doubt the Patients pleasure must be followed in this; for some had rather have the sore a long time incuring, than be cut; others are ready to undergo anything, so they may but be quickly cured. For such Ulcers are the soonest, yea the safest cured, if the hard and livid flesh be cut out with a convenient Instrument, to the sound; for the Pain is both shorter, and no ill quality is communicated to the Part, as there is by eroding Medicines, the green Water, Oyl of Vitriol, &c.

Idem. XXI. If a dry intemperate be joyned with an Ulcer, the cure of the Ulcer may in a manner be neglected for some time, and the Intemperature must be opposed, till the Part be restored to its natural temper.

Idem. XXII. When an Ulcer, is often renewed, it always gives suspicion of the bones being corrupted, as both Galen and Paul say. We may often observe this in rottenness of the Teeth, out of which corruption oozes out by the holes of the Bone in the Jaw, and raises an Ulcer outwardly in the Jaw, which though it be healed, yet after a little time the Cicatrice breaks again. Therefore, if such an Ulcer appear in the Jaw and be often renewed, the Teeth must be looked into, and if any one be rotten, it must be drawn. For the Ulcer will not heal perfectly, before the Tooth, which occasion'd it, be drawn.

Idem. XXIII. In such an Ulcer with caries (or rottenness) in the Bone, if the Corruption be so great, that it cannot all be removed by Medicines, there is need of Surgery, and the corrupted Bone must be taken away either by Abrasion or Burning. And two Instruments are here requisite for Abrasion, the Scalprum (or Scraper) and the Terebra (the Trepan or Wimble) the Scalprum is of use, where the Bone is not corrupted deep; but the Terebra must

must be used, if the rottenness penetrate deep. Concerning Abrasion *Celsus lib. 18. c. 2.* writes, "He that scrapes these, must set his Instrument on boldly, that he may do something, and that quickly. He must give over when he comes to the white or solid bone: It is plain, that the blackness is gone, when the white appears, and the caries is gone, when a Man comes to the firm Bone. And some Blood comes, as is said before. But when it goes deep, the case is doubtful. In a caries indeed, the knowledge is easie: A small probe is put into the hole, which as it enters more or less, shows either that the caries is deep or shallow. Blackness also may be gathered from the pain and Fever; which when they are moderate, it cannot be deep, yet it is more manifest by the trepan: for there it ends, where the dust ceases to be black. Therefore if the caries go deep, holes must be bored thick and as deep as the Bone is foul, then red hot Irons must be run into those holes, till the Bone be perfectly dry. For after these things, all that is foul of the Bone underneath will be wasted, and the Sinus will be filled with flesh, and either no Humour will come at all afterwards, or but very moderate. But if there be blackness on one side, and the caries run to the other, it must be cut out, for all that is foul must be taken away. If it be found underneath, it must be taken away as far as it is corrupt. And whether the Bone be the Skull, the Bone of the Breast, or a Rib, when it is corrupt, it is useless, and there is a necessity to cut it out.

XXIV. From which it appears, the Antients after scraping of the Bone, also burn it; because burning is a most present Remedy to consume excrementitious humidity. But we must have a care, that in applying the Caustery, the adjoining Flesh be not also burnt. Therefore the Causteries must be applied through Iron pipes, by which the flesh may be defended; several of which must be in readiness, that when one is grown hot, another cold one may be used: Or, if you will use but one, when it is hot, put it in cold water. What moisture soever oozes out at the Bone, must be wiped with a sponge or a cloth, lest it corrupt the adjoining parts.

XXV. A Man of Forty had a Malignant and inveterate Ulcer in his left Leg, with a Varix of a vast bigness, for it was almost as thick as my Arm at the Wrist, and near a span long: and it began almost in the Ham, and went down towards the Foot, and took a compass and made two circumvolutions. But, which is remarkable, as soon as he lifted his Leg up on high, the Blood went away presently, but as soon as ever he set it to the ground again, it was as big in a moment, and in a word, the Blood ran backwards and forwards, sometimes one way, sometimes another, just as if it had been in a pipe. Moreover, because varicous Ulcers can never be healed, till the varices be cut out, I thus went about the cure; Having put him in a good course of diet, and purged his Body several times, and bled him in the Arm on the same side, I laid him on a Bench, and in the Ham separated the Skin gently from the Vein, and then with a double thread and a crooked Needle I encompassed the Varix; and at the lower end of the Varix I went the same way to work: But before I tied the thread, and made a knot, I ordered him to set his Leg to the ground, to the end that the Blood might, as it used, come down: for I was afraid, that Blood might do some harm: Then I tied the thread strait at the upper end of the Varix, and made a knot; and afterwards at the lower end. Which being done, I opened the Varix near the upper knot, that the Blood contained in the Varix might come out: But when more Blood came out, than the Varix could contain, and I looked narrow-

ly on the place, I found a blind duct which entred the Varix near the lower ligature; Because it could not be tied with a thread, I applied a little escharotick unguent to the Mouth of it, and afterwards our powder to stop Blood, with the white of an Egg, and then bound all with a fillet dipt in oxybate, and left it till the next day. Afterwards I cured the wounds as other wounds. In the meantime I omitted nothing about the Ulcer, that seemed necessary, and I purged his Body now and then. So by God's blessing he recovered, and is hitherto well.

Hildanus, Cent. 4. Obs. 85.

XXVI. I must not pass this over in silence, when Melancholy, like Lees in Wine, settles in the bottom of the Vessels, and by reason of its grossness resists Medicines in purging of the Humours, Galen prudently begins with bleeding in the cure of a Canker, Leprosie, and malignant Ulcers. Therefore *lib. de medicamentor. comp. n. 7.* he glories, that he began the cure of a malignant Ulcer in the Leg, encompassed with varices full of black Choler, with Phlebotomy, afterwards he purged Melancholy, then he cut the Varices a cross, and so he happily cured the Ulcer, which others could not cure.

Langius, Epist. 17. l. 1.

XXVII. In curing of Ulcers nothing creates a Surgeon greater trouble than a Caries in the Bone; especially if it be deep, because of the Humour in the Bone. For the drying up of this Humour, and falling of the Bone nothing is better than an actual Caustery. Next to this *Euphorbium* has the second place, which because it is sharp and hot in the fourth degree dries up the Humours in the Bone, and besides seems proper for it by an occult quality. But *Dioscorides* and *Avicenna* advise, that, if any do use *Euphorbium*, he guard the flesh near the Bone with Liniments, because of its extreme sharpness, lest by touching the flesh, it raise an Inflammation. Therefore it was a good while, ere I durst use it, for fear of Inflammation or pain; yet by degrees experience taught me, that though it bite the Tongue and Nose extremely, yet in Ulcers, though it be strewed on plentifully, it causes no Inflammation or pain. Therefore I use it with good success for carious bones, bare of flesh, even when the Lips of the Ulcer are diminished, strow-

Hildanus.

XXVIII. If Sarcoticks weaker than they should be, be made use of, great store of Sanies is gathered in the Ulcer, and soft and flaccid flesh is bred: And if over strong and drying things be used, the Ulcer grows dry, the Lips are red, and the flesh is consumed, bloody matter also comes, and pain is found in the place: But if the part grow red and dry, as it ought naturally, and no corruption run out of the Ulcer, and a good colour appear in the flesh, it is a sign of a good Sarcotick Medicine.

Sennertus.

XXIX. If the Ulcer be with a dry Intemperature, Moisteners are required: Here warm water is good, if the Ulcer, or rather the parts near the Ulcer, be bathed with it: for although *Hippocrates lib. de Ulceribus* shows, that all the Ulcers must not be wet, except it be with Wine, yet *Galen* writes that no moistening thing is good for Ulcers: But he means, that Moisteners are not good for Ulcers, as such.

Idem.

XXX. One had been a long time ill of foul malignant Ulcers in his Feet. He applied several things; he drank many sweating Decoctions and Specificks, but all in vain. At last he was anointed with Quick-silver, as People are for the Pox, and he was fluxt and cured successfully. But why does *Mercury* cause Salivation? By its great tenuity of parts it powerfully dissolves, melts and softens, therefore either applied or taken, whatever familiar and connate Humour it has by degrees melted, it carries it all by the Glands, and Salival Vessels into the Jaws, and Mouth, and it comes up neither by Coughing nor Vomiting, but by continual spitting.

Thiermaie.

XXXI. A

XXXI. A reverend Divine of a good age, having laboured some Months under an Ulcer on the inside of his right Leg along the shin Bone with much pain, sent for me. The part affected was distempered with great heat, and the Ulcer discharging a *Sanies*, endeavours had been used to digest it with Turpentine and the yolk of an Egg, and such like unsuccessfully. I fomented the Ulcer and Parts about with Claret Wine, and dressed it with 2 parts of *Unguent. diapompholyg.* and 1 part of *Unguent. basilicon majus* with *Præcipitate*. Upon the Lips of it I applied Pledgits spread with *unguent. diapomphol.* and an Emplaster of some of the same *diapomphol.* over all, with Compress wrung out of the Wine, and rowled it up lightly, placing his Leg in Bed as before. The next day I brought a Decoction of leaves of Plantain, tops of Bramble, Horse-tail, flowers of red Roses, and Pomegranate flowers, to which I added some Wine, and while it was heating, I took off the dressings, and found the heat somewhat allayed, and the Ulcer well disposed to digestion. I stupefied the Ulcer, dressing the parts about with *unguent. Tutia mag. Vig.* and rowled it up as before. By this method the hot intemperies removed, and the Ulcer digested: after which by the help of *unguentum defecativum*, and the Alom-stone I cicatrized it firm, to the satisfaction of the Patient and his Relations, leaving him again to the care of his Physicians Sir Alex. F. and Sir Fr. Pr. by whose order I made him a Fontanel, and some while after put him on a laced Stocking.

XXXII. A Maid of about 35 years of age, of a Scorbutick habit of Body, had an Issue made in her left Arm, which was continued running many years; but at length, whether through negligence or from some other reason, she suffered it to dry up. The Winter following she grew very much out of order by reason of a great complication of ill Symptoms, of which the most important was an intolerable pain in that Arm and place where her Issue had formerly been. After various courses of Physick and external applications, she was in some measure relieved, and was pretty free all the following Summer: but in the Winter, viz. 1672. her pain returned with such violence, as to afflict not only the place of the Issue with such pains, that she likened it to the cutting off of the Arm, but it stretched it self in a while after to the whole Arm, Shoulder, yea the very side it self; so that many attempts being made, the Chirurgeons in the Country opened two Issues on each side of the seat of the old one. Many other things were done, till at last she came into my hands. Dr. Walter Needham was her Physician, and upon examination found her afflicted with a Rheumatism, for which he instituted a convenient course, and judged withall that the pain of the part was from the usual way Nature had taken to the old Issue, whither the sharp Humours making their passage, and finding no vent, did disperse themselves through all the branches of the Axillary Artery on that side, viz. to the Scapular and Thoracick branches, &c. the Pain being every where found, according to the place of their distribution. To the cure of this, besides what was inwardly administered, it was thought requisite to eat down deep by a caustick, into the place where the old Issue had been, and thereby to divide the Fibres of the Membrane of the *Biceps*, which lay just under it, and seemed to be the place of the principal pain. When this was done, we divided the Eschar, and cut it out, then filled the opening with *Præcipitate*, and applied a Pledgit of *Unguent. basilic.* With Oyl of Lilies upon it, and dressed it up. We dressed it every other day, till the remaining Eschar and Slough separated; then we incarned and cicatrized the Ulcer even. From the time of the opening this her Pain ceased, and she was well of that, but laboured under a Rheumatismus in great measure, it swelling her Thigh, Legs, Hips, and

lower Belly; but by frequent Phlebotomy, Purging and other Prescriptions, she was by my said Friend happily cured.

XXXIII. A Maid Servant living in a Noble Family had cut the inside of her right Leg by a fall upon a hot Grate-Iron, and having suffered about eight Weeks under ill Chirurgery was commended to my Care. The Ulcer was with loss of substance and sanious, with some pituitous swelling in the Lips and Parts about it. I dressed it with *unguent. basilicon* mixt with *Præcipitate*, 1 drachm of it to an ounce of the Unguent. I applied over it a Plaster of *diachalcit.* sprinkled with a little Vinegar, and a Compress wrung out of Oxycrate, then rowled it up with the expulsive Bandage; the Cure indeed consisting mainly in the well rowling, the want of that causing frequently crudity in the Ulcer. By the use of it both the Influx was restrained; and the member strengthened, and with the help of the Unguent aforesaid it was digested: as the Lips flatted by virtue of Compression, it incarned; and by *unguent. Tutia* and Pledgits dipt in Lime water cicatrized in few dayes, without Purging or Bleeding.

XXXIV. A Gentleman of about twenty years old, of a good habit of Body, put himself into my hands for the cure of an Ulcer on his right side the breadth of the palm of the Hand. It was occasioned by a burn, and had been bigger. The cause why this remaining part of the Ulcer did not cicatrize, was most evident, it being over-grown with loose Fleth. I applied Pledgits of a mixture of *unguent. basilicon* with two parts *Aegyptiacum* upon it; with Bandage: but observing it not to yield to that so soon as I designed, I levelled it with the Caustick stone, and after separation of the Eschar digested the Ulcer with *unguent. basilicon* and *Mercury præcipitate*, and afterwards cicatrized it.

XXXV. A young Man by some accident bruised the back of his Hand: it inflamed and apostemated; and after some while terminating in a sinuous Ulcer, and underneath corrupting the Bone, I was consulted, and advised the way of dressing it: but that method not being observed, other Bones of the Hand became carious, and the Hand in great hazard of being lost. Upon which he was commended to my care. Sir Alex. Fras. being present, I took off the dressings, made a search with a Probe, and felt the Bones leading to the two middle Fingers bare, rough, and as I suspected, rotten. The Orifice being small, I applied a Caustick large enough to make way for the taking out those bones; then divided the Eschar and dressed up his Hand with Digestives, Emplaster and Bandage. Sir Alex. Fras. prescribed him a vulnerary decoction, and left the prosecution of the cure to me. As the Eschar separated, I saw the Bones leading to the two middle Fingers black, and softened with putrefaction. I laid hold on the one with my forceps, and pinched it into pieces with much ease, bringing part of it away. I fomented the hand with a Decoction of Wormwood in Wine, dissolved a little *Aegyptiacum* in some of it, washed the Ulcer and applied a Dressing dipt hot in it upon the Bone, and *unguent. basilicon* over the Eschar. I then pinched out what was most rotten, dressed the remaining ends of them with a mixture of *unguent. Aegyptiacum*, Spirit of Wine and extract of *Scordium* actually hot with an armed Probe, applied Pledgits of the same upon the Bones, rubb'd the loose flesh in the Ulcer with a Vitriol stone, and laid *unguent. diapomphol.* upon Pledgits over the tender edges of the Ulcer. By this way of dressing I deterged the Ulcer; and at several times pinching out those rotten Bones, that led to the two middle Fingers, disposed the rest to cast off. During which I laid the Ulcer higher open to the joynt of the middle Finger: which knuckle I also found rotted to pieces, and took out what would come easily away; then dressed the

N n n remaining

remaining *Caries* as the other in the Hand, and after some time made a separation of the *Caries* there. Having the while digested and healed the Ulcer I first laid open, I also cicatrized this part, and dismissed the Patient well cured, as I thought. But some while after he came to me again with a Tumour upon that Knuckle of the middle Finger, from some remaining splinter of a Bone. I laid it open, and took that out. While I was curing this, I observed a small opening, with a Tumour near it as big as a small Hazle-nut, upon that part of the Bone which led to the Fore-finger. I opened this by Causticks, and discovering part of the Bone black, pinched it off, and dressed the remaining end with *Aegyptiacum* scalding hot upon an armed probe. I kept the Ulcer open with Dossils prest out with Spirit of Wine, till I made separation of it, then cured this Ulcer also. And from that time, which is more than 5 years he hath continued well, and his Hand is firm and strong; Nature having supplied that loss of Bones with *Callus*. But he beareth the Marks of the Disease, which will assert the truth of what is here delivered.

Idem. p. 188.

XXXVI. A Daughter of a substantial Citizen laboured under an Abscess in the Region of her left Kidney, and was long treated by a bold Empirick, who promised Cure: but after all his endeavours the Child languishing under the Ulcer, sometimes by the great discharge of matter by Urine, and other times through the suppression of it, great pains were stirred up within the Body, and outwardly in the Abscess. I, being consulted observed the external Abscess took its Original from the Ulcer within the Kidney, and required another manner of dressing, its Cure being the work of time. I proposed the laying it open to the very part where the matter passed forth from the Kidney. To which purpose I applied a Caustick upon the *Sinus* below, divided the Escar, and dressed it up with Lenients. Then after separation and digestion of the Ulcer, searching the same with my Probe, I found the *Sinus* run up above the Orifice; which being also laid open, I discovered the passage into the Kidney, and felt the side of the last short rib bared by the matter in its passing out. I dressed the Ulcer with *mundifex Apio*, and healed up the remaining *Sinus* above and below to the very Arperture. While I was doing this work, Doctor Barwick was consulted to help us in the Cure by Internals, who prescribed a Traumatick decoction of *Sassa*, &c. with the more temperate Plants and balsamick Pills to temperate the Humours. During my disposing of this Ulcer to retain a *Cannula*, the Matter discharged by Urine in great quantity, and the Patient was as sorely afflicted and had the same Symptom that others have who are diseased with Ulcers or Stones in their Kidneys, but after vent was given by a short *Cannula* of Lead she recovered. Having continued the use of the *Cannula* some months, I removed it and kept a Pea just in the opening, and by red Sparadrop and compress retained it on, then left her to her Mother to dress, and only called sometimes when they gave me notice of their wants. After a year or thereabout that she had kept this fontanell open, the internal pains and discharge of Impurities ceased, and she grew more fleshy and strong. She went also dayly to a neighbouring School, where she was exercised in dancing, &c. After the space of two years or thereabout, the Ulcer seeming not to matter more then might be expected from a small fontanell, the Mother cast out the Pea, and permitted it to heal up. But being soon alarm'd by the old Accidents, which returned upon the Child, she sent for me. I opened it again, and left them to keep it so. Doctor Barwick was also again consulted, who repeated the former Method with some little alteration. The Ulcer was afterward kept open near 3 years, during which the

she repeated her course of Physick Spring and Fall, and was frequently brought to me. At length I seeing her well grown, and of a fleshy and healthy Complexion, and the Fontanell in a manner dried up, I advised them to throw out the Pea, it being of no use. They did so: from which time the Patient hath continued strong and well and is since married. *Idem. p. 206.*

XXXVII. In the cure of deplorable Ulcers, which cannot otherwise be cured for much ferocity, as in a contumacious Itch, the Small Pox and Meazles, I have often experienced the happy energy of *Antimonium Diaphoreticum*, *Regulinum* or *Cerussa antimonialis diaphoretica*, which Schroder l. 3. Pharmacop. describes. Yet you must know that you must continue the use of it, as of all things that purge the Blood, for 2 or 3 Weeks. Then it will have a better effect, if vulnerary essences of the woods be made use of between whites, by which means internal Wounds and Ulcers will be quickly cured. It is indeed a Medicine that excels all Decoctions of the Woods, and all magisterial Potions. Outwardly it dries, wherefore it may beneficially be prescribed in cosmetick waters, as Bean water, *Solomon's Seal*, *Hepatica nobilis*, &c. against spots in the Skin. It makes the Skin clean and fair; it may also be prescribed among cosmetick Unguents for fissures and chaps; The Dose is from half a scruple to half a drachm. *Hofmannus.*

XXXVIII. A Vomit is of use to Physicians that cure Ulcers or Wounds, and at divers times. 1. When the lower parts being afflicted, we prevent a greater mischief from purging downwards. 2. When the upper parts are ill. 3. When the peccant Humour is of such a nature, that it is difficultly carried downwards, and easily upwards. 4. When no inward part being afflicted, we chuse a Vomit for revulsion sake, as in Diseases below the Girdle. 5. When there is Matter in and about the Stomach, which feeds the Disease. 6. If the Patient be not eafie to be wrought upon by a Purge, and therefore violent Medicines be necessary, such as are dangerous for the Patient. 7. When the Stomach will not retain a Purge, but throws it up again. 8. When no benefit has been found from several Medicines, that have been given. 9. When after gluttony and high feeding, the Belly is full of mucous and slimy Phlegm. *Severinus.*

XXXIX. By means of a *Sanies*, that makes its way by a sharp and nitrous quality, it often comes to pass, that an Abscess, Ulcer, or *Fistula* has two or three holes: Which sort of Ulcer a Man can scarce heal up with his utmost Industry; both because, that when one hole closes up, it makes the other wider, and because between the holes there is often a partition of callous Flesh or Skin. This Ulcer most endeavour a long time in vain to close up with Medicines; others, although they know the difficulty, yet know not how to help it. In the mean while by their way of cure it is protracted a long time unhealed, which yet of its own Nature were eafie to be cured, if it were treated by Chirurgery properly so called. Indeed I do not deny, but one may break the partition between the *Sinus*'s with Septicks, but not without either the great disadvantage of pain, or the inconvenience of Inflammation. Moreover section is the more expedite, and alwayes the safer way, it is only required, that neither the Physician, nor Patient, either or both of them, be affrighted with a shew of evil. I say a shew; for often where bungling Surgeons are afraid to use their Knife, I have been of better courage, and found no danger. Of a great number of which, the chief is the eldest Son of the King of Feg, in whom under the *Perinaeum* I cut open two Ulcers, which corresponded by a common *Sinus*, at a great distance. *Severinus.*

XL. A Woman had an external Ulcer in her nether right jaw, not far from her Chin, which was open

open for several years, and could not be cured. I gave her a purge, and Cerufs of Antimony, with cephalick Conerves in form of an Eleſuary; and in a ſhort time the Ulcer was dried up and healed, without the help of external Medicines.

Benivenius. XLII. A young Man had been ill of an Ulcer in his Chin for 3 years, which reſuſed all Medicines. Some Phyſicians, conſidering its deepneſs and calloſity, affirmed it could not be cured without fire. Others, becauſe of the callous Lips thought it a *Chironium*, and therefore that it could not be cured at all. But, the nature of the Ulcer being conſidered, I denied it could be cured, without a tooth were quite pulled out, which when it was done, it was found rotten at the root, which was the cauſe of the Sore, and in a little time after was healed with ordinary Remedies.

XLIII. In the year 1664. a Student by my advice, who had a tedious Ulcer in the inſide of his Leg, uſed common Remedies to no purpoſe, and would not be fluxed, but went to *Viridungum*. After he had taken the Waters, according to the ordinary preſcription, for 20 dayes, he purged not at all. Which is the uſual effect of thoſe waters, but he made abundance of Urine: And in 3 Weeks time his Ulcer dried up and he was well.

Barbette. XLIII. Ulcers in the Feet, eſpecially about the Inſtep, create the Chirurgion much trouble and pains, becauſe all the Humours of the Body ever run to thoſe parts, and this is the reaſon, why they reſuſe the beſt Remedies. But if the Foot be bound hard, beginning at the lower part and going up to the Knee, and the Patient be purged once or twice a Week, the cure will ſucceed, as well as one could wiſh.

XLIV. In Ulcers of the Feet we muſt not preſently proceed to heal them, when the Patient is enclined to worſe Diſeaſes: for it is to be feared, that the fluxion, cauſed by Nature's goodneſs, might be hindered by over haſty cloſing, and recur to the inner noble parts, and there cauſe greater inconveniences: If therefore Ulcers of the Feet ſeem over troubleſome, having purged, bled and ordered a better Diet, make an Iſſue in each Foot, and then heal the Ulcer.

XLV. A young Man had had a Contuſion on his great Toe, it inflamed and ulcerated: When it was grown inveterate, and could as it ſeemed, be cured by no Remedies, he came to me; His Toe was ſwelled and inflamed: On the outſide of it there was an excreeſcence of Fleſh, as big as a Bean, which covered almoſt half the Nail: The Barber-Surgeons had ſeveral times waſted it away with cauſticks, but to no purpoſe; for whatever they waſted in the day, it grew up again, like a Muſhrome in the Night. I, enquiring out the hindrances of cure, found the Nail under this Fleſh extuberant, and ſeparated from the Fleſh underneath, which therefore did prick the found Fleſh continually towards the root of the Nail, cauſed pain, and attracted the Humours plentifully. When the cauſe was known, I put the Patient in hope of a ſpeedy cure: Therefore having purged and bled him on the ſame ſide, I ſtrowed ſome burnt Alom powdered upon the excreeſcence of Fleſh: And I applied to his Toe and to his whole Foot a cooling and anodyne Cataplaſm; Take of Bean flower 2 ounces, powder of red Roſes, Pomegranate flowers, and Cypreſs-nuts each 2 drachms, Saffron half a ſcruple. Boyl them in Plantain and Roſe water, and a little Vinegar. Add towards the latter end, the yolk of an Egg and a little Roſe water. Apply it warm. With this the pain and ſwelling abated much, the excreeſcence of the Fleſh was a little waſted, ſo that the Nail, ſeparated from the Fleſh underneath, which the excreeſcence of Fleſh had covered, came into ſight. I cut it away, as carefully as I could, with a Pen-knife and Sciſſers, and when I had ſtrowed on it a drying powder, and ap-

plied *Diapatha* plaſter, he quickly recovered. Hence let Chirurgions learn how much it concerns them, to know the cauſe of a diſeaſe.

XLVI. Frequently after the cure of an *Ichor* and a *Meliceria*, we find the joynt ſo ſtiff and hard that it can be bended neither one way nor other: Here oftentimes Chirurgions labor a long time to mollify the joynt, Ligaments and Nerves, but in Vain; for that *Ichor*, which flows from the whole Body to the wounded joynt, and has ſuch acrimony corrodes and waſts, firſt of all the ligaments and tendons, which encompaſs the joynt, and then the Cartilages, which cover the joynt. Hence it comes to paſs, that the Bones, being diveſted of their Cartilages and Ligaments, do as firmly grow together by a *Callus* (which I waſt the firſt that obſerved) as if there had never been a joynt there.

XLVII. Why is a full and a moiſt courſe of Diet bad for all Ulcers, and a thin and dry one good? Whether becauſe a moiſt Diet makes the matter of the excrements more fluid? for moiſture is terminated by any thing but it ſelf, and drineſs by it ſelf. Or is it, becauſe moiſture opens a paſſage? for Moiſture makes lax the paſſages, which drineſs ſtops up. And they flow, eſpecially when they are ſharp, and when the moiſture of meat and drink abounds: And a paſſage eaſily ſucceeds by theſe parts, which of their own Nature are apt to receive the excrements of the whole Body. Or is it, becauſe the Skin, among all its other uſes has this remarkable one, to retain the Humours and Juices, which run from within to the habit of the Body, and to ſtop them as it were, when otherwiſe they would eaſily run out and be diſcharged! So therefore as the want of Skin is the cauſe, why the ſerous Humour oozes out, it will be much more in ſick Perſons; like as in Plants and Fruits, when the bark of them is cut, the uſeful Humour runs out, ſo an Ulcer ceaſes not to run till it be cruſted over, nor does it ceaſe running in Plants, till the Cut cloſe up. Wherefore *Hippocrates lib. de Ulceribus* ſayes *The dry is next to the ſound, & the dry is ſound*. Or is it becauſe of weakneſs, for which the part does ill receive much adventitious moiſture whether excrementitious or uſeful, and waſts the moderate heat, and is diſtempered, ſo that it can neither concoct nor aſſimilate the ſame? Wherefore it is ſaid by *Arnaldus doct. 5. cap. 18. Aliment attracted, and not incorporated, turns to fanies*, and therefore ſuperfluity of Aliment hurts wounded perſons. Or is it, becauſe by how much more aliment comes to the parts, by ſo much more Excrements are bred? And this being poured in plentifully infects and ſpoils the place. Moreover *Hippocrates* writes *l. de nat. human.* that when an Ulcer cannot be healed of a long time, Moiſture is the cauſe of it. It is neceſſary therefore that the whole Body be dry, and that the part be dry, for the agglutination of an Ulcer. Or is it becauſe an Ulcer, that is moiſt by Nature, is encreaſed by the acceſſion of a moiſt diet, as withered Plants, when they are watered aſreſh, grow green again? But not only the Ulcer, but the parts about it grow moiſt and ſtiff with an inflamed or ſome other Tumour, without the ſoundneſs of which, the Ulcer can neither dry nor heal. Theſe are Reaſons ſufficient to reject a moiſt Diet.

Now a ſlender Diet is approved of in Ulcers, as *Euſtachius Rhodius* has obſerved, to the end, Nature may be more deſirous to diſtribute that which is ſcarce ſufficient for it ſelf: For an Empty Stomach attracts from all the parts round, ſo as that by long conſequence the circumference of the Body is emptied; And that ill Humours may be corrected by Nature's conſtant evacuation of them which would be hindered and diverted by plenty of victuals. Therefore *Hippocrates lib. de locis p. 47. ſayes, Whatever Diſeaſes turn to Ulcers, and are eminent above the reſt of the Body, they muſt be cured by Medicines and Abſtinence*. And a little after, *Proud and riſing fleſh, muſt be brought down by Diet*. But otherwiſe when the Bodies of ulcerous Perſons abound

Severinus.

Cacochymy, they will find huge inconvenience from a full and moist Diet. For 2 apb. 9. *Impure bodies, the more you nourish them, the more you hurt them.* Wherefore I use to say, that by a spare Diet much mischief, which would ensue, is retrieved.

XLVIII. If you would clearly know how hurtful an ill course of Diet is for Ulcers, I will propound to your consideration the evidence and experience of Apparencies, which have informed me when the Patient has been any way irregular. For the Sores continue a long time, and sometimes putrid and fungous caruncles breed in the Ulcer, sometimes callosities and other filth and tumors grow in them, sometimes there is a troublesome pain, and sometimes an Inflammation about the part, and an internal one too. To say nothing, how ill sometimes the Ulcer looks, and what a strange colour and stench sometimes uses to follow. The Patient must needs suffer these and such like things, who indulges his Appetite and crams his Gut, and has no command of himself. On the contrary he that can rule himself and his Appetite, will both quickly be cured and will feel none of those things I have spoken of. For as Celsus l. 2. c. 16. says, *Nothing helps a sick man more than seasonable Abstinence.* Here I will tell you mine own observation, which I have made by long experience, When I had a great number of Ulcerous persons under my care in the Hospitals at Naples, It is very pleasant to hear, how I used to find those out, that offended in their Diet, not only being able to distinguish the men and the time, but even the manner and how far they had offended: Because Ulcers are so quickly and easily altered according to what is taken inwardly. Therefore he that will, may observe this with me, The flesh of a Delinquent's Ulcer will look like the flesh of a Beast that has been soaked in water, answerable, that is, to the common cause of the affection, for the Ulcer is diluted by the fluxion of what is taken, as flesh is, when steeped in water. It fares otherwise with him, who is content with a little food: For his Ulcer will look red and clear, like Coral or the lean of a Gammon of Bacon, contracted and low; to say nothing of Pus, which will be laudable.

Idem.

XLIX. Whether may a large, but not a moist, Diet be allowed in Ulcers? Moisture is twofold in general, Evident, and extended in a fluid substance, this they call Actual; another only contemplable by reason, which they call Potential. Now, though we avoid formal moisture in right curing of Ulcers, this certainly must be very inconvenient, which makes it up in quantity, and so much the rather, because there are not wanting things, which have a potential humidity in them: Nevertheless we could not blame only the liquid moisture, were we to neglect that the other, which is latent in a great quantity of matter, and equivalent to the forsaide moisture must equally be avoided. Truly, the matter of the Blood is proportionable to the meat dissolved in the Stomach, and the Superfluities are correspondent in quantity to the Store of Blood that is bred. For even in meats, that are thought not to be moist, there is some portion of moisture mixt with them by Nature's workmanship. Wherefore there is no reason, why we should only decline an apparent humidity in Diet, and allow any other; both of them in their forms and modes are noxious: Wherefore in curing of Ulcers the Diet must always be as spare as it can be.

Idem.

L. Let no man deny Wine in Ulcers, if they be old, and not joyned with some hot disease, which we ought to fear either present or imminent. In new Ulcers indeed Wine must be avoided, because of Inflammation and those consequent mischiefs which Hippocrates mentions *initio lib. de Ulcer.* As much therefore as Wine is approved of in curing old Ulcers, so much is it condemned in new ones.

Idem.

LI. Hippocrates *lib. de Ulcer.* appoints Ulcerous Persons no other Diet than bread and water. But he speaks of new ones, and immediately explains himself, to prevent Inflammation and a Gangrene, and Convulsion of the Limbs. But he has not declared what sort of Diet is good for old ones. I think, for such as have gentle Ulcers, unless they have some great plenitude or some Disease depending thereon, or some eminent danger persuade the contrary, the eating of Flesh is not discommendable, especially of Animals, which use swift motion, and yield least superfluity, for they are of a good juice, as Birds of the Mountain, and four Footed Beasts, except Swine's Flesh, which is all bad, but the Feet. Perhaps Hippocrates his opinion of Eggs and new Cheese is no other; which is better verified, when Ulcers (as they mostly are) are hollow and sinuous: For what sooner fills the vacuities of the Flesh, than a congeneous substance, which by affording plenty of Blood fills the empty spaces of Flesh, and repairs them for healing up? Yet this is hindered, because from Flesh, a food of much nourishment, there is a great product of excrement, which is immediately carried to the Ulcer, as is said before. For Answer, we say, that there is a twofold moisture in any thing, either concocted, and well conquered by the heat, so as it contains little excrementitious and superfluous in it; Or there is much excrementitious and superfluous, and little concocted but corruptive. The moisture that is in Flesh and Eggs is rather nutritious than excrementitious: Therefore roasted Flesh, though it have more moisture in it than boyled, is more proper for Ulcers than boyled, as experience makes out. So that which is inconvenient for Ulcers, it contains alwayes much moisture, either in the whole Aliment, or in part: Such are Broths, Caudles, Grewel, Pot-Herbs, Sallers, juicy horary fruits (for such as are dried in the Sun or in an Oven are not condemned) Cucumbers, Fishes not Saxatil, Milk and all things made of Milk that are new; All these things are bad for Ulcers, and sharp things especially when they should fill up and heal. But of fruits you must except them that are of an astringent virtue, as Quinces, Medlars, Idem.

LII. I must in this place take notice of a common abuse practised by Physicians in ulcerous Persons and others, for whom, because they are of a good juice and temper the heat of the Blood and the Liver; they make messes of Cichory, Endive, Baglows, Parsley, Gourd, boyled with Flesh, or Sippets and Sops of Bread in them, and they think they are proper, but they are very inconvenient. For all these preparations, since they have drunk up much moisture, do, when it is digested in the work-house of the Body, remit it to the Ulcer: Wherefore while these things are used, it will be perpetually moist, and will never heal up. Therefore I cannot chuse but laugh at, or rather pity, those, who hoping to be cured in a Month, are not cured in a whole year: for how can Ulcers be healed, which are continually moistened with the humidity of Visuals? Idem.

Medicines especially made use of by eminent Physicians.

1. To cure all old Ulcers perfectly; Take quick Lime 2 pounds, pour to it 5 quarts of hot water. Let it stand till it cool, strain it through a brown paper, in which dissolve Mercury after this manner; Take of this water 1 quart, add 3 drachms of *Mercurius dulcis*, let it stand in digestion: You will have an inestimable Liquor. For spreading Ulcers; Take the water distilled off rotten Apples, dissolve therein a little *Mercurius dulcis* and *Saccharum Saturni*, filtre

filtrate them. It is a secret which cures Ulcers and *Fistulae* perfectly, if they be washed there with. ¶ The *Arcanum* of *Aristolochia rotunda* is also of great efficacy here; Take *Aristolochia rotunda*, pour to it some Spirit of Wine, let them stand in digestion, and the Spirit of Wine will be coloured, repeat this till no more will be extracted, then draw off the Spirit of Wine, till an essence remain as thick as Honey, pour to it some water distilled off rotten Apples, extract the pure Salt from the *Caput mortuum*, and add the rest, and so you will have the true essence of *Aristolochia rotunda*. ¶ This is a sure Remedy for Ulcers with worms in them; Take of Savin 2 handfuls, Camphire half a drachm, the middle rind of an Hazle 1 pugil. Boil them in a sufficient quantity of Wine, pour it into a Vessel, put the Ulcerous Foot into it, and immediately little Worms will come out Swimming upon the Liquor: Repeat this several times, and the Ulcers will be cured.

2. Black earth Snails, which are found creeping among the leaves and grass, without Houses, in Spring time, maled together, and applied to Ulcers, soften all Ulcers wonderfully.

3. To inflamed Ulcers apply the narcotick Spirit of Vitriol, which is made of calcined Vitriol and Spirit of Wine mixt together, and putrefied in a close Glas for a Month. This Spirit separated is good not only to allay all Inflammation, and pains of Ulcers, but of the Gout it self.

4. I take water Frogs and hang them in a Cucurbit, so as they may not touch the bottom and burn, and so the water, which is drawn off, get a strong Smell. I put fire under it, and draw it off gently in Sand, and keep it for use. For it is most precious in malignant and cancrus Ulcers, also in a *Polypus*, *Ozena*, and in Ulcers of the *padenda* and *sedes*, it extinguishes Inflammation and corrects malignity. I put not out the fire, till they be perfectly dry, and no more water will come over: but I keep that which comes last by it self, for it smells something strong, and is not so grateful in Ulcers of the Mouth and Nose. The Frogs thus dried I put into a melting crucible, and burn them to white ashes. They are good not only to stop Blood, but in all malignant and fœtid Ulcers, for if they be strewed thereon, they cleanse and correct malignity.

5. This is a most excellent Ointment; Take of Oyl of unripe Roses 6 drachms, Myrtle, *unguentum populeum* each 3 ounces, leaves of Plantain, Nightshade each 1 handful, shred them, and mix all together; let them stand 8 dayes, shaking them every day, then strain them, add to the colature of wax 4 drachms. Mix them upon the fire, till they melt, stirring them with a stick, when it is warm, add of Litharge of Gold 6 drachms, Cerus 2 drachms, prepared tutty 2 drachms, Camphire 1 drachm and an half. Mix them in a Mortar for 2 hours.

6. The root of Dragons is excellent for Cacoethick Ulcers.

7. The juice of Pimpernel with the purple flower, with the Herb, bruised and applied to malignant Ulcers, perfectly cures them.

8. Mercury precipitate corrected is a singular Remedy against all Ulcers.

9. Many in a deplorable condition have been happily freed from their Ulcers by a decoction of Mint, wherewith the Ulcers are washed Morning and Evening, and afterward some powder of Rue strewed on. ¶ Oyl of Sulphur, and *Emplastrum Diaphanum* anoynted and applied does the same.

10. Some cure the most desperate Ulcers with this mixture; They take of Mercury sublimate 1 drachm, they powder it very fine, they pour to it the best rectified Spirit of Wine 1 pound. They set it in a Glas Body in Sand, till the Sand grow hot and the Spirit of Wine burn, They boyl also

a drachm of *Lignum Guaiacum* in 3 pints of water half away, when the water is cooled and filtered, they add the said Spirit of Wine; which mixture is applied with lint and tents to the Ulcers.

11. Take of Salt of Litharge (it is prepared as *Sal Saturni* with distilled Vinegar) 1 drachm, Spirit of Turpentine 2 drachms, macerate them in hot Ashes, till the Liquor grow red; It is of admirable vertue in inveterate Ulcers, Tumours, and Wounds.

12. I have often experienced the following Plaster to be good. Take of *unguentum diapomp. diapalma*, *griseum* each 1 drachm, gum *Elemi* 2 drachms *Saccharum Saturni* 1 scruple, a little Wax. Mix them and make a Plaster. ¶ Spirit of Wine especially is excellent in deterging and cleaning putrid Ulcers; and therefore should be mixt with other Medicines.

13. The following unguent is effectual in absterging Ichors and foulness of Ulcers; Take of juice of Parsly half a pound, Myrrh 2 drachms, Turpentine 1 drachm and an half. Boyl them all together, make an unguent, wherewith rags and tents may be smeared and put into the hollow of the Ulcers, this cleanses well without any harm.

Ba better.

I. Bleeding must of necessity be celebrated in an Inflammation of the parts, otherwise it does harm. ¶ A young Man of a good habit, upon the breaking in of a hot matter out of the right *Hypochondrium*, fell suddenly into vomiting, and could be cured by no means but by Bleeding, though the Physicians were very doubtful about it: for after it the intemperature of the Liver ceased. A Seaman, who had a vomiting and an appetite, could not stop it by setting a Cupping-glass to the bottom of his Stomach, but only by taking away some Blood; for when the hot evaporation of the Liver was abated, which did pierce the upper orifice of the Stomach, the Patient recovered.

Rhodius.

II. A Countryman, 34 years old, fell into frequent vomiting after his Meat, which lasted for some dayes, so that he had tried several Medicines in vain, and was in danger of his life: He at last was freed from his vomiting by applying only one Cupping-glass to the bottom of his Stomach twice after meat. And his weakness was such, that besides vomiting, he often voided a great quantity of Blood by his Nose: which Symptome nevertheless vanished with the rest by that only Remedy.

Rumlerus, Obs. 14.

III. The Excrements that stick to the Stomach are often a cause why men cannot keep what they take, and things that are impacted into its Coats, make it often vomit up, what it contains in its Cavity. Therefore a Vomit caused by Art, which may expel what sticks to the Stomach, or is impacted into its Coats, will cure a Vomit by taking away the cause; as a looseness and dysentery are cured by Purging and Clysters. Yet they ought not to be given rashly, but when Remedies, which are in their own nature contrary to the Disease, seem to give no ease. ¶ And it must be provoked by a moderate Emetick, not a weak one, such as warm Oyl; nor by a violent one, which draws from parts afar, as such as are made of Antimony; but with such as have a strong faculty of dissolving the glutinous humor; Such as *Gilla Theophrasti*, or *Vitriolum album preparatum*: Its Salt is more efficacious, which is made of Vitriol calcined to an intense redness. ¶ *Valleriola* is afraid to give a Purge to such as are troubled with a constant bilious or pituitous Vomiting, because it is presently brought up again by vomiting, and does no good, but a great deal of hurt, by irritating the Stomach, and disturbing the humors, and not evacuating them. But it is my Custom, and I have long experienced it, first to carry off the humor, that is the cause of the Disease, by vomit first, and then to strengthen the Stomach both by taking things and by applications, that it may afterwards contain the Purge. But they are in error, who immediately at the beginning stop vomiting with Astringents; for they fasten and retain the bad humors, which Nature endeavours to cast off, and which afterwards will prove the causes of grievous Diseases.

Vallesius.

Riverius.

Eucher. Med. Pract.

IV. Clysters are very good in all Vomitings, if we give them in a small quantity, and no strong Laxatives or Oyls: For if a great quantity be given, part of the Colon, which lies upon the Stomach, is full, and the bottom of the Stomach is pressed, and by that faculty, whereby it irritates the expulsive one of the Intestines, it provokes to vomits, as Experience shews in several. And strong ones must not be prescribed, because there are but few Excrements: Let them be made therefore of emollient Herbs, Seeds, and Flowers, that discuss wind, dissolving therein some *Mel rosarum*, *violarum*, *casta*, or juyce of *Mercury*.

Rondeletius.

V. After long vomiting, or when one cannot keep his food, let Clysters be given of a decoction of Capon, without Salt, Sugar or Oyl, but with a little Wine for Nutrition. A great quantity of these must be given, that it may go high, but not greater than can be retained: for when the Guts are empty, they draw such a Clyster, and retain it for their nourishment. It is the best way to boyl Anniseeds in

them, to make them dispel Wind: for the empty Guts are full of Wind, which hinders the Clysters from going in. Such Clysters should be given, as often as the Patient used to eat. For they will do good three ways, by nourishing, breaking Wind, and because, when the Stomach takes nothing, all motion therein to vomit is quiet, and the Stomach contracts it self.

VI. When a Woman in the Iliac Passion vomited most enormously, several Medicines did her no good, till *Horsius* gave her a few drops of *Elixir proprietatis Paracelsi*.

VII. A Gentleman 35 years old, of the Senatory Order, being subject to Diseases in his Spleen, was taken with a vomiting so unexpectedly, that he spewed in the Dishes at the Table: When he had taken the Waters called *Vicomitenses* in *Avernia* for a Month, he returned to his Country *Geneva* free of his Disease.

VIII. That cold water is proper in many Diseases coming from Bile, the Writings both of the Ancients and Moderns do testify. A certain Noble Lord, a Frenchman by Nation, at a certain time did upon his departure shew down too liberal a shower of *Bacchus*, born at the *Canaries*, upon the Company. The Courtiers his Companions, as they went home, were taken with vomiting: This looked like a Symptome arising from a Surfeit. Three days after this Nobleman was troubled in the like nature, but far more violently; for his Age was greater, and his Stomach more sluggish. I was called to ease his enraged Stomach: I endeavour to effect this with various comfortable Internals and astringent Externals. All was to no purpose; whatever he drank or eat, in the fermentation caused so much wind and trouble till the Vomiting gave him some little ease: I tried to allay the inflammation contracted from the flame of the Wine with vitriolated Juleps and Emulsions, but in vain: At length I conjectured that Vitriolate things did rather exalt the vicious ferment of the Stomach; and that Emulsions could not sufficiently correct that excess, because they are not so plentifully prescribed by Physicians, or cannot be taken by the Patients without Loathing. Therefore I proposed a most liberal draught of cold water, which could not encrease the ferment, but weaken it, by diluting it. He drank off a Glass that held 12 Ounces: The Stomach received its friendly guest most kindly, and kept it quietly without the fermentation hitherto usual. The Noble Person admired his quietness, and by continuing to drink cold water, did quickly, safely and pleasantly check all the violence of the raging *Archeus*.

Sigism. Graef. in Misse. 477. an. 4 & 5.

IX. Among Poysons which produce enormous, and for the most part mortal vomitings we reckon Arsenick, Orpiment, and corrosive *Mercury* sublimated; all which in respect of their manifest or latent acrimony are most happily tempered, and prepared for a more gentle excretion with oily things, as fat Broths, any expressed Oyl, Butter, &c. Among which Milk also uses to be coagulated by them, and voided again, wherefore it is good, inasmuch as these coagulating Poysons do more readily joyn themselves to it, and in that very thing lose their nocent Power.

Sylvius de le Boe.

X. If some malignity, as in the time of Pestilential Feavers, cause a troublesome Vomiting, it must be opposed, not with Purges or Vomits, but only with Cordials, taken inwardly and applied outwardly. ¶ In that which attends Malignant Fevers 1 Scruple of Salt of Wormwood, with half an ounce of fresh Citron juyce is a most excellent Remedy: For this besides its deterfive faculty saturates the peccant acidities; as also do prepared *Perl. terra sigillata*, *Bole Armenick*, with Rob of Corinths or Barberries mixt with Sorrel Water.

Eucher. Med. Pract.

XI. They that have writ of the Scurvy, almost all of them order Antiscorbutick Medicines to be given in Milk or Whey; And *Engalenus* writes that Vomiting

Frid. Hoffmannus.

ing in Scorbutick persons is better stopt with Milk than with Astringents: when yet Milk is easily corrupted, and breeds Obstructions; but it is good, because by its fat substance it greatly tempers the acrimony of the humors: For with how great acrimony the humors in Scorbutick persons are endued, the eating Ulcers in the Gums and Legs do sufficiently argue. I have seen Handkerchiefs of a thick cloth not only corroded by the Scorbutick Blood, that came out at the Nose, but the Washer's hands also exulcerated, that made them clean. Nor need the corruption of the Milk, or the procuration of Obstructions, be feared from it: for boyling and seasoning with Salt or Sugar will prevent these Mischiefs. Besides the Antiscorbuticks which use to be boyled in it, will sufficiently prevent such things. And I do not think the foresaid the only reason, why Vomiting is better stopt by Milk than by Astringents, but also because by its absterive faculty it cleanses those sharp humors, and carries them off by stool; whereas Astringents on the contrary detain them in the Body, and fix them more firmly to the Coats and Fibres of the Stomach; whence afterwards arises a perpetual vellication and an irritation to Vomit. And Whey is therefore given, because it not only tempers and cleanses the humors, but also because of its nitrosity, and therefore its volatil Salt, siezing the fixt Salt, which abounds in Scorbutick persons, it dissolves it, and makes it more volatil. ¶ In a Scorbutick Vomiting hot and sharp things are hurtful, and more exasperate the mischief: On the contrary, things that affuage pain, and qualifie the acrimony and scorbutick Salt, are proper, especially Goats Milk with juice of Water-Cresses or Scurvygrafs.

XII. The bending in of the *Cartilago Xiphoideis* (otherwise the falling in of the Breast) hurts the Stomach, and causes vomiting and difficulty of breathing, by hurting the Diaphragm: Therefore this Cartilage must quickly be raised, and set right again in its place. Some say it may be raised by applying a dry Cupping-glass to the mouth of the Stomach.

XIII. Vomitory Medicines taken unseasonably or in too great a quantity, and producing outrageous Vomiting, can only be checkt and conquered by Opiates. ¶ After the taking of a Vomit, motions to vomit are several times repeated, till the matter of the poisonous tincture be absterged from the fibrous crust of the Stomach, and at length be all cast up, to the end, that the Nervous fibres of the inner Coat may imbibe the Poyson of it no more. But it does not always so fall out that the vomiting is therefore at an end, but though the Physick be wholly cast up, and none of its Contagion remaining, yet oftentimes the stomachick Spirits being too much provoked, will scarce lay aside their fury, so that they are irritated by any other juice whatever (which the Nervous fibres imbibe) and are cast into emetick Spasms, and often repeat them. Wherefore that the vomiting may then cease, nothing potable, whether alimentous or Cordial, must be taken into the Stomach, but, a hot fomentation being applied outwardly, the Patient must go to sleep. Moreover, sometimes other humors expressed out of the vessels, and especially bile, poured out of the Choledochal passage into the Stomach, do not only add strength to the Vomit, but when its operation is over, continue further to provoke the Stomach, and urge it to excretory Contractions. For this reason, when bile abounds, seeing upon a small occasion it is called into the Stomach, very often a cruel vomiting with horrible Symptoms is caused by a gentle Vomit; for quieting of which, it is convenient sometimes to give a lenient Clyster, to the end the turgescit bile may be solicited downwards. ¶ In a *Hypercatharsis* caused by a Vomit, the Patient being laid in bed, must be carefully treated with Medicines both internal and external,

and first of all that the guests of the Stomach may be quiet, either a Warm Fomentation of a Decoction of Pontick Wornwood, Mint and Spices in Wine; or else a Tost of Bread dipt in warm Claret Wine, must be applied: Let a Clyster of Milk with Treacle dissolved in it be given: Let warm frictions of the Limbs, and strong Ligatures above the Knee, which keep Spasms from those parts, be used: Let the Stomach in the meantime, unless there be fainting, be kept empty: But as soon as it can keep any Aliment or Medicine, let some Cordial Water, or burnt Wine warm, be taken. In a great Perturbation, if the Pulse admit, a little Treacle or *Dia-scordium*, sometimes also a Solution of *Laudanum*, or *tinctura Opiatica*, will be proper.

XIV. Mr. Girardus, Seventy years old, a Senator of *Newenburgh* was troubled at times with vomiting of a very sharp and black humor; a cruel, piercing pain of his Stomach preceeded, he put his Finger in his Throat and brought up such matter. He desired Medicines of me for his Stomach; but I told him his Spleen must be cured, of which he said he was never ill; because he hated to take much, I prescribed him some lenitive Elestuary, *Catholicon* or the like, that the gathering of humors, and the fluxion of them to the Spleen might be prevented: He followed my advice for a Month, and he was so long free from his Vomiting and Pains. At length, as it is their Custome there, he went to a Priest, that practises Physick in the Territory of *Friburgh*, suspected of Magick: He prescribed him I know not what, after which he was worse; for he took his Bed, who before could go about his Business, and died in a few days, having been first troubled with a violent pain in his Stomach. His Friends desired he might be opened; I told them before, that there would be nothing found in his Stomach, but that they would find the cause of his Disease in his Spleen. And his Stomach indeed proved faultless; for there was nothing found there, but a few Cherry-stones, which he eat the day before; but the upper part (about a third) of his Spleen was quite wasted, as if it had been bitten off: We could not search any further, because of the unskilfulness of the Dissector, who was liker a Butcher than an Anatomist. This Disease came very nigh the Black Disease of *Hippocrates*, which he mentions *Lib. 2. de Morb. 1. 161.*

XV. A Merchant stopt a tedious Vomiting from a laxity of his Stomach, by taking for 40 days together fasting, 4 or 5 hours before Dinner, 2 or 3 ounces of Biscoft Bread, without Drink: for it soaks up the moisture, and strengthens the Stomach; *Pliny l. 22. c. 25.* gave light to this Remedy against a *Defillation*; which the Noble *Peireskius* stopt with a mouthful of dry Bread, and some odoriferous sweet meat.

XVI. It often arises from the Obstruction of the Arteries of the Spleen, and then the use of Martial Spaws is good. The Wife of Consul. *N.* 39 years old, her *Menses* flowing well, complained of her being troubled with vomiting every day, either before Dinner or Supper, with a dull pain in her left *Hypochondrium*, Head-ache, and a great anxiety of Heart. Various humors were brought up by Vomiting. First of all she was Vomited, then Purged, and outwardly strengthening Balsams were applied; but all in vain: At length she recovered upon taking Martial Spaw-waters in a Decoction of Apples.

XVII. A strong Man, otherwise well enough, had of a long time been ill of frequent Vomiting, he often used to cast up immediately what he had eaten. At length, being above all Remedies, the Disease grew to that pass, that he eat with a good Appetite, till the *Oesophagus* was full to his mouth, and then, nothing getting into his Stomach, he immediately Vomited up what he had eaten, crude. When therefore he was every day in danger of perishing, I made him an Instrument, like a rod,

Michael Do-
Angius.Petraeus &
Barbette.Sylvius de le
Boë.Willis
Pharm. Rat.
Sect. 1. Cap. 2.

Idem, Cap. 3.

Rhodius.

Erid. Hist.
mannus.

of Whale-bone, with a button of Sponge fastned to the end of it: The Patient presently after he had eaten and drunk, thrust the food down into the *æso-phagus*, having opened the Mouth of the Stomach, which would otherwise have reſtagnated: And he has taken his food every day theſe 16 years by the help of it, and yet uſes the ſame Inſtrument. Undoubtedly in this caſe, the Mouth of the Stomach being alwayes ſhut either by a Tumour, or a Palfy, will admit nothing into the Stomach, unleſs it be forced open with violence.

Willis.

XVIII. In a moſt violent Vomiting, let 3 grains of *Laudanum* and 2 ſcruples and an half of *Pil. coch.* be given. The Vomiting will ſtop, and five hours after the Patient will purge downwards. A pretty large quantity of Purgatives is given, becauſe the Purgative virtue is infringed by the *Laudanum*, which muſt therefore be mixt with diargydiates and colo-cynthiaries.

Riverius, l. 9. c. 7.

XIX. Becauſe Plaſters operate ſlowly, Unguents, or Liniments, or Inunctions muſt be made, upon which we ſtrew powders adding a good quantity of Vinegar. All Inunctions muſt be made in the beginning with hot things, in the end with cold: for all hot and cold things are aſtringent, the warm are laxative: and we muſt anoynt without much rubbing, but only fomenting it lightly; for all agitation or motion about the Mouth of the Stomach provokes to Vomit.

Rondeletius.

XX. Plaſters above any other forms of Topical Medicines, ſhould in this caſe be applied to the Stomach; left by rubbing the Stomach with Oyntments Vomiting be ſometimes cauſed.

Platerus.

XXI. When the Stomach utterly reſuſes Medicines, which muſt of neceſſity be uſed, before you give the Patient any thing, apply ſuch a Plaſter; Take Oyl of Maſtich, Quinces each half an ounce, cruſt of baked Bread, ſteeped 2 hours in ſtrong Vinegar, 2 ounces, *Spodium*, Maſtich, Mint, red Coral prepared, Sanders white and red each 1 drachm, Barly flower, what is ſufficient, to make them up. Dolorifick ligatures of the extreme parts are good; and a dry Cupping-glaſs applied to the bottom of the Stomach.

Cæſo.

XXII. Vomiting is cured by Vomits if the ſtrength be good, which very thing *Hippocrates lib. de Lec.* confirms, becauſe the cauſe of the Vomiting is carried off. So a certain Soldier was taken with a burning Fever, and vomited up whatever he took, to whom on the fifth day, when he aſked my advice, I gave him half a drachm of *Sal Martis* in Beer pretty warm, after which he caſt up a load of vitious Humours, and then he kept well whatever he took. Thus is it confirmed, that Vomiting is cured by a Vomit. Such Symptomatical Vomits often proceed from Humours that irritate the Stomach; yet the Vomits muſt be ſuch as have an Aſtringent, and ſtrengthen the Stomach.

Frid. Hofmannus.

XXIII. According to *Avicenna's* advice, let not them that Vomit, eat, till they be very hungry.

XXIV. In a Symptomack Vomiting the con-junct cauſe is either in the Stomach, which produces this Idiopathick affection, or being fixt in other parts it cauſes Spafms in them, and by communication by the Nerves emetick perturbations in the Stomach: as it happens in Fits of the Stone, Colick, Mother, in the *Vertigo* and other Diſeaſes; the cure of ſuch a Sympathick Vomiting depends on the cure of the primary Diſeaſe. And the emetick matter reſiding in the Stomach, is either poured into it from ſome where elſe, or is bred there through defect or depravation of concoction. In either caſe the preſent load muſt firſt be diſcharged, and then all further product of it muſt be prevented: Therefore that the impure filth of the viſcous matter may be cleared from the Stomach, a gentle vomit may be given with *Carduus poſſet* drink, or *Ozymel* or Wine of Squills, or with a Decoction of Ca-

momil flowers or Agrimony roots, or a Solution of Salt of Vitriol or the like: Then the remainder of the matter muſt be carried off by Clyſters, or Purging with *Pilul. Maſtich. Stomach. cum gum.* or *Tinctura Sacra*, or a gentle Infuſion of Rheubarb. Moreover, ſince the impure or rancid Blood does often afford a new ſtock of incongruous matter, either by the Arteries, or Choledochal Veſſels, and breeds an emetick diſpoſition, Phlebotomy often does good. And therefore the Vomiting of Women with Child is often cured by this means (See *Tit. Pregnant. BOOK XIV.*) Furthermore, thoſe things are proper which temper the Blood, ſo that adult recrements are not bred in them. Therefore drinking of Whey, Medical Waters, Juices of Herbs, *Sal Prunellæ* and the like, in as much as they put the Blood in fuſion, and carry the recrements another way, do often remove this vomitive diſpoſition. Such Medicines will alſo be of uſe, if frequent and dayly vomiting proceed from the meeting and ſtriſe of the biliary Humour and the pancreatick juices, and their regurgitation into the Stomach.

Willis.

XXV. The Vomiting is more frequent and difficult of cure, which proceeds from ſome incongruous matter, bred within the Stomach, in as much, namely, as all that is eaten degenerates into an irritative putrilage, becauſe of the vitiated ferment of this part. Wherefore in this caſe, after the filth of the Stomach is cleaned by gentle evacuators, Medicines vulgarly called Digestives, are of uſe, which according as the fermentative juice of the Stomach is for the moſt part of a ſaline nature, ſometimes of a Sulphureous, and is in a various ſtate of fixity, fluidity, or aduſtion, are various, and ſometimes one, ſometimes another does good. In Belching and an acid Vomit the following Medicines may be tried, and the method may be taken from the *juvantia*. Take of *Pulvis Ari Compoſitus* 1 ounce and an half, Salt of Wormwood 2 drachms, Sugar of Roſes 3 drachms. Make a powder. Give 1 drachm of it morning and at 5 a Clock in the Afternoon in a draught of Beer boyled with Mace and a cruſt of bread, or in diſtilled water or Tincture of Pontick Wormwood. Take of powder of Ivory, Crabs-Eyes, red Coral each 2 drachms, Coral calcined 1 drachm, red Sanders, Cinnamon each half a drachm. Make a powder. The Doſe half a drachm in the ſame manner. Take of the Tincture of Salt of Tartar 1 ounce. The Doſe 1 ſcruple to half a drachm, twice a day, in ſome appropriate diſtilled water. *Idem.*

XXVI. In Vomiting from a ſharp and hot matter Medicines endued with a ſowre and vitriolick Salt are more convenient. That famous one of *Riverius* is proper in this place; Take of Salt of Wormwood 1 ſcruple, give it in a ſpoonful of juice of Lemons. Take of Coral prepared two drachms, Salt of Wormwood one drachm and an half, juice of Lemons four ounces; Let them ſtand in a capacious Glaſs; Add of ſtrong Cinnamon water 2 ounces. The Doſe, a ſpoonful or two twice a day, firſt ſhaking the Glaſs. Take of powder of Ivory, Coral each 2 drachms, Vitriol of Mars 1 drachm, Sugar Candy 1 drachm. Mix them. Divide it into 6 or 8 parts; let 1 be taken twice a day in ſome convenient Vehicle. In this caſe mineral, purging waters which have much Nitre in them, and Iron Waters, uſe to do abundance of good. *Idem.*

XXVII. If when the Stomach perverts moſt it takes, into a bitter and bilious putrilage (as it often does) it be therefore inclined to frequent vomitings, Medicines both Acid, and Bitter, are proper; Take of *Elixir proprietatis* 1 ounce; take 1 ſcruple twice a day in ſome convenient Vehicle; Take of Rheubarb in powder xxv grains, Salt of Wormwood 1 ſcruple, Cinnamon water half an ounce, juice of Lemons 1 ounce. Mix them. Take this either by it ſelf, or in ſome convenient Liquor. Take of powder of Crabs-Eyes half an ounce. Tartar Chalybeate 2 drachms, Sugar Candy 1 drachm. Make

idem.

Make a powder. The Dose half a drachm with some convenient Liquor twice a day.

XXVIII. The cause of a frequent and habitual Vomiting is oftentimes not so much any matter irritating the Stomach, as a weakness of its Nervous fibres, and its too great propensity to irritation; inasmuch namely, as they being very tender and infirm, can neither concoct what is taken, nor bear the burthen or load of it; but are presently irritated by any thing that lies upon them, and therefore put the contrary Fibres into emetick Spasms, that they may throw off what is troublesome. In this Affection there are 2 cases, to wit, Either a weakness of the Stomach, implanted in the very Fibres, is contracted from some inordinate courses, as Surfeiting, daily and immoderate drinking, frequent drinking of Wine or hot Waters, and other Errors in Diet, inasmuch as these Fibres being distended beyond measure, or too much heated, or as it were roasted, cannot admit or contain animal Spirits in a quantity sufficient; Or, Secondly, these Fibres, although of themselves they be well enough, yet because of Nerves somewhere obstructed, they are deprived of a due afflux of Spirits, and thereupon being languid and flaccid, they cannot bear what is taken, but being oppressed, they force it back by Vomit. Thus I have known several, who, without any impurity of Stomach, or *languor* contracted from disorder, have been taken, as it were, with a Palsy in that part, and lost their appetite, and have been subject to frequent Vomiting. In the first case such Remedies are indicated as may by their Stypticity make the too much distended and thin Fibres to corrugate and contract into a narrower room, and such as may by their pleasantness draw spirits more plentifully thither, and refresh what are languid. Take of Conserve of red Roses vitriolate 4 ounces, preserved Myrobalanes 6 drachms, Ginger preserved in India half an ounce, *Species de Hyacintho* 2 drachms, the reddest *Crocus Martis* 1 drachm, Syrup of Corals, what is sufficient, Make an Eleuary. The Dose 1 drachm twice a day, drinking a draught of distilled water upon it. In a weakness of the Stomach or resolution caused by some Nerves being somewhere obstructed, Antiparalytick Remedies joyned with Stomachicks will be of great use. Take of *Elixir proprietatis Paracelsi* 1 drachm. The Dose 1 scruple twice a day in the following water; Take of Cypress tops 6 handfuls, leaves of Clary 4 handfuls, the outer rind of 12 Oranges, Cinnamon, Mace each 1 ounce, roots of *Cyperus*, lesser Galangale each half an ounce. When they are cut and bruised, pour to them of *Brunswick Mum* 8 pounds; distill them in common Vessels. Tincture of Coral, Tartar, or Antimony, may be used in the same manner. In this case *Spiritus Salis dulcis*, also Spirit of Sal Ammoniac or its flowers, give great help. Moreover Vomits and Purges, and Sweats, are often given with benefit. I have known this Disease several times happily cured by Bathing in the Bath at *Bathe*.

XXIX. In Vomiting, and the Disease Cholera, *Laudanum* may be given with Syrup or Tincture of Roses or with *sapa* of Quinces and let a Cupping-Glass be immediately applied to the region of the Stomach, and make a Cataplasim of Leaven, powder of Mint and Orange Peel, with some juice of Mint.

Medicines especially made use of by eminent Physicians.

1. Let this Plaster be applied, for it does wonders; Take of Mastich, Cinnamon, *Lignum Aloes*, Zedoary, Galangale, Cloves, Anniseeds, *Marathrum* each 3 drachms: Mix them: Make a powder. Mix the powder with Oyl of Mastich and Balm: And then with leaves of Wormwood and Mint, and

baked Bread boyled in Wine, make a Plaster, and apply it warm.

2. This following applied, is found to stop Vomiting presently; Take of sower leven 2 drachms, dried Mint powdered, Mastich powdered each 2 drachms and an half, powder of Cloves 1 drachm, a little Vinegar. Mix them, and spread them on a Cloth and apply it warm, it does excellently well.

3. Water cooled in Snow stops a pertinacious bilious Vomiting above all things: As I have found by experience.

4. This is a most excellent Remedy for all Vomiting; Take of Cloves grossly beaten half a drachm, Roses 1 Pugil, red Wine half a Pound. Boyl half away. The Dose 2 Spoonfuls after meat.

5. If enormous Vomiting follow the taking of Antimonial Medicines, take 4 drops of Oyl of Cinnamon in Cinnamon-water, and the Vomiting will presently stop.

6. This is admirable good; Take Yolks of Eggs, fry them in a Frying pan with Oyl of Mastich, adding powder of Mastich and Coral, till they become a soft cake. Apply them hot to the Mouth of the Stomach.

7. I have learned by experience, that Water and Vinegar of Roses with the Yolk of an Egg and a little Salt, without any Butter, presently stops Vomiting.

8. A crust of Bread dipt in Malmsey Wine or Mint water and sprinkled with powder of Mint, Mace, Cloves, Cinnamon, or *Spec. Aromat. rosat.* and applied to the Stomach, is effectual. ¶ In whatever cause Bread toasted, dipt in Vinegar of Roses, and bestrewed with powder of Mint, Cloves and Roses, is good. ¶ This is a certain experiment and reckoned as a secret by some; After the taking of Antimonial Medicines, which vomit too much, to give a spoonful or two of Spirit of Wine, and it gives present help.

9. Dried Coriander infused in Vinegar does admirably in a hot cause.

10. Sower Leven soaked in strong Vinegar and juice of Mint applied and renewed twice or thrice, most certainly stops Vomiting by Purging and due Revulsion.

11. A few Coriander Seeds, in Vomiting after the taking of a violent Medicine, have an admirable property to stop it, if they be chewed.

Perfusa,

Willis,
ibid.

Mayenne,
tract. de
Laudano.
M. S.

Persea, which Medicines purge and bind, and no way disturb the Humours, so that you need not fear any vomiting of Blood will be caused thereby.

Riverius.

II. There were two Women at *Padaa* who the day before their *Menses* came, Vomited Blood; they perceived the Vomit before it came: which if the Physician tried to stop, divers Symptoms would arise, and go away with vomiting.

Rhodius.

III. In Oynments, Epithemes, and other applications, we must take care, that they have some heat with their astringent: for though the flux be stopt with cold and astringent things, yet this is done, upon taking the indication from the function of the part (that is, the Stomach) and from the time: *Cyperus*, Spike, *Cassia*, and Cinnamon, are the best among other Astringents: For besides that they preserve the nature of the part, they help also the penetration of the astringent and cold things, which are of gross parts.

IV. In vomiting of Blood the use of Oyls is suspected, because they open the orifices of the Veins rather than close them: Therefore *Aloysius Mundella* denies Oyl of Sweet Almonds to all that vomit Blood.

Bartholinus.

V. The use also of Vinegar alone is suspected, because it exasperates the parts, and raises a Cough, whereby it promotes a new fluxion. Therefore it must be sweetened with Honey or Sugar.

VI. A Country-Man was ill of Vomiting of Blood, that would give way to no Remedies for several dayes. The Physician being desirous to carry off the Blood, that was gathered in the Stomach, by vomit, prescribed him 2 ounces of Oyl of sweet Almonds, which made him vomit, and he brought up clotted Blood, and a Leech also that moved upon the ground. This was an unknown and rare cause of vomiting of Blood. The Patient said afterward that he drank of a rivulet, where he had swallowed a Leech with the water.

Riverius.

Obs. 26. Cent.

4.

VII. In the year 1662. I saw in the Town *Boudri* within the Territory of *Newenburgh*, a Notary fifty years old, who vomited at one time a pound of clotted black Blood, and, as he said, he had vomited as much the day before. His Stomach was then squeamish, with a sense of a load, wherefore I gave him a little warm Oxycrate (for there was nothing else at hand) which brought up no less quantity. Because the strength was good, I prescribed him a *bolus* of Conserve of Roses with 1 drachm of the powder of Rheubarb, which brought away a great deal of clotted Blood mixt with the Stools. Then I proceeded to strengtheners. For Preservation I ordered him to Bleed at the *Hæmorrhoids* twice a year (for the flux came from his Spleen, as the swelling of it returning at times did testify) giving him Chalybeates and openers of Obstructions. He followed this wholesome advice for 2 years; which being neglected the third year, his vomiting returned with greater violence, which deprived him of Life. I have known many (*Jayes Dodonæus cap. de Absynthio l. hist. stirpium*) who have brought up Blood by vomiting. I remember I saved one or two by my advice after once vomiting, and indeed by the frequent use of Wormwood all manner of ways.

VIII. The excretion of *Pus* by Vomit and Stool must not be stopt, but gently promoted, seeing it is an Humour *toto genere* preternatural, and every way hurtful to Man. But the new growth of it must be hindered, as much as can be, since it is bred of Blood, the fewel of our vital flame, and the food of all the parts of the Body, as well containing as contained. Among all things which move or promote excretion of *Pus* I prefer and commend Antimonial Medicines: for I have often observed that they have not only a virtue of correcting the mischief which comes from *Pus*, but also of hindring the breeding

of new *Pus*: for rightly prepared and administered it serves no less for the purifying of Man's Body, than for purifying of Gold. Also *Balsamus Sulphuris Anisatus*, and any other, stops the continual generation of *Pus* out of corrupt Blood, if 2 or 3 drops be taken several times a day; from which also the cleansing and certain healing of the Ulcer may be expected, and perhaps more certainly than from any other Medicine. To this end also *Antimonium Diaphoreticum* will conduce, and any other altering Medicine made of Antimony, and a Balsame artificially made of its flowers.

Sylvius de le Boc.

Medicines especially made use of by eminent Physicians.

1. To stop vomiting of Blood I gave these with success; Take of Mummy 1 drachm, juice of Horsetail 1 ounce, water of Plantain, Horsetail each 1 ounce and an half. After the Patient had drank this cold, his Bleeding and Vomiting stopt. ¶ To a Woman, who brought up her *Menses* by vomit I gave this Clyster for diversion; Take of Chicken broth wherein a few Prunes, Raisins, and Aniseeds were boyled, *Cassia* for Clysters 1 ounce, oyl Olive, of sweet Almonds, Chamomil each 1 ounce, common salt 1 drachm, *Sal Gem.* half a drachm, the yolk of an Egg. Mix them. Make a Clyster. She recovered beyond expectation with this one Remedy: But every Month, before her vomiting came, she was bled in the Foot.

Forestus.

2. Practitioners use to apply Remedies to the Spleen: as I have observed from experience, when the Patients have vomited great quantities of black Blood, the vomiting has been presently stopt by this Plaster. Take of Barley flower, Acorns, root of Comfrey each 1 ounce and an half, blood-Dock 2 drachms, Plantain water and red Wine each what is sufficient. Mix them. ¶ Pomegranates also are very good to allay the fury in this case.

Gremb.

3. *Trochisci de Carabe*, de *Terra Sigillata* each 1 drachm, Water of Shepherds purse, Purslain, Plantain each one ounce. Mix them. This immediately does good.

Grulingius.

4. An Amulet of a Plate of lead, or a flat pot of lead with Quick-silver in it, if it be hung to the back, is very good in this case.

Kozak.

5. This is certainly true, I remember a certain young Noble-Man, who voided such abundance of pure Blood at his Mouth, sometimes without, sometimes with Coughing, that you would have sworn he would have vomited up his purple Soul. This Person at the time of his Fit held fast in his Hand some Shepherds-purse; and out of his Fit, put some Shepherds-purse to the soles of his Feet, and both his Vomiting and Spitting of Blood stopt: But I recommended to him, as to other Phthical Persons, the fume of the best native Sulphur, which he was ordered to receive with his open Mouth, by which means he was not only cured of his Vomiting of Blood, but he married a Wife.

Simon Pauli.

6. That the Blood may not congeal upon the Stomach, two ounces of Simple Oxymel should be given. But if it be congealed, the best Remedy is 1 ounce of Hares Rennet, with 3 ounces of Vinegar, given in drink.

Rhodius.

7. This applied to the Breast and Stomach quickly suppresses vomiting of Blood; Take of Rye-Bread 3 handfuls, Salt 1 handful, Vinegar what is sufficient. Mix them. Make a Plaster.

Mart. Rudandus.

When Blood may be let? I.

The Cure of it, when caused by tearing the Bladder. II.

I. IF the Menfes or Hæmorrhoids be stopt, then indeed if you can easily bring them down, you must bleed in the Foot sparingly, and at times, as much as may suffice to abate the abundance; but if the stopt Blood be crude, as it often is, you must bleed more sparingly, and then Purge, and afterwards proceed to things that strengthen the part. But if it come from a defluxion of fluid Phlegm, which is ever running, or of thick Phlegm, which having gathered there, caused that mischief, we must have a care of letting Blood, unless the Body in like manner abound in Blood.

II. In the year 1608. I was called to a young Woman of her first Child, whose Bladder a foolish Midwife had torn, so that she could not keep her Urine one moment. Whereupon her Skin of the *Labia Pudendi* was first excoriated with the continual running; then there grew so many Warts, but soft ones, as I believe no man's two hands could hold them; both her Buttocks also were almost eaten away with her Urine. I ordered her to be carried to *Liege*, being desirous to cure her. As soon as I fell upon the cure, I anointed thick that ugly great lump of Warts with the *Magma* of crude Antimony and Sublimate, out of which they distil the Butter of Antimony; which being often scraped off, the *Labia Pudoris* did at length on the third day show themselves deep buried, and the putrid eaten flesh of her Buttocks gave some hopes of Cure. As soon as I could part the *Labia*, and observe the Spincter of the Bladder, I fitted a Silver Pipe to it, the shorter end whereof I put into her Bladder, and to the longer, which stood out four inches, I fastned a Pot: The Urine in this manner being carried another way, and the Ulcers cicatrized, she seemed well, and the Nineteenth day after she came to *Liege*, she called her Husband to her, with whom she had not lain for two years, by whom, when I had taught her to put off and on her Silver Pipe, which was necessary in their embraces, she was with Child, and was safely delivered. But after I had used several things in vain for the stopping of that dropping of her Urine, I left her glad of this one thing, that, though she was troubled with the Pot, yet she lived without Pain. Afterwards I met her very well, and she offered me the Silver Pipe again, if I had any occasion for it. I was amazed, how she could be rid of her incontinence of Urine, and she shewed me a Bag hung about her Neck, wherein there was the Powder of a Toad, which had been burnt alive in a new Pot. A *Cingar* had taught her this, and that she would hold her Water as well as before her Bladder was torn.

The Contents.

Vinegar does not alwayes hurt. I.

It delights in sweet things. II.

The Hæmorrhoids must not be opened. III.

It throws off its impurities to the Groin. IV.

Sugar is an Enemy. V.

In an Abscess of the Womb after the Suppression of the Lochia, what Vein must be opened? VI.

What Vein must be opened in its Inflammation? VII.

Whether we may use Vomits? VIII.

When Flesh may be allowed? IX.

An uterine Fungus taken away by Section. X.

Whether there be any such thing as the falling out of the Womb? XI.

A Vomit must not be given. XII.

A Semicupæ must be used with Caution. XIII.

When Astringents are proper? XIV.

One resembling the Sciatica. XV.

What such the Candle or Obturamentum should be? XVI.

In an Inflammation Clysters must frequently be given. XVII.

Sudorifics and Narcoticks are proper in it? XVIII.

The Efficacy of Fomentations and the way of applying them. XIX.

A Caution about Fumes. XX.

The Cure of an abscess upon the *ala Pudendi*. XXI.

The Cure of Warts of the Vulva. XXII.

A huge swelling in the Pudendum taken away. XXIII.

An easie Cure of inflation of the Womb. XXIV.

Narcoticks may be given in a Cancer of the Womb. XXV. Medicines.

I. ALTHOUGH Hippocrates & *Acut.* says, that Vinegar is *ὀξεῖα* (or painful to the Womb) and affirms that Women are more hurt by it than Men, yet he often uses it in their Diseases, which arise from some fault in the Womb: for he used it not only applied outwardly, and gave it by the Mouth, but he also injected it into the Womb in Collutions, and Fomentations made of Vinegar, as is manifest from *Lib. de Morb. Mul.* to wit, because of the remarkable faculties which Vinegar has of cutting, attenuating, drying and cooling, with tenuity of parts, which are not found equal in another Medicine, we are often forced to use it, though it may do some harm; that is, when the benefit which results from its foresaid Virtues, is greater than the inconvenience that comes from its smell. ¶ *Riverius* orders Clysters of Oxycrate in Fits; yea, he gives a glass of it, by which he says the Fit is presently stopt, the vapors which cause it being repressed, and coagulated.

II. There must always be this caution in things of the Womb, the serous Remedies must never be prescribed without sweetness, otherwise they will go to the Kidneys, for the Womb delights in sweet things, as the Kidneys do in serous. For this reason *Galen* mixed not Honey in the cure of *Boethius* his Wife, when he would avert the course of the humors by Diureticks, wherefore we add Orrice to the Honey that it may more greedily be received by the Womb.

III. In

Martianus
Com. in loc.

Heurnius

Heers,
U. J. 14.

III. In Diseases of the Womb it is clear, that it is not necessary to open the Hemorrhoid veins, because the redundant Blood in this part may be purged by its own Vessels, and much safer: For though these Veins may easily be opened, yet they are not so easily shut again. And if the *Lechia* succeed not, they may be voided by proper Uterines.

Walaeus.

IV. As the Men do discharge their Liver and Spleen to the Groin, so Women do moreover what is redundant in the Womb: And the way whereby this filth runs is reckoned by Anatomists the lower Ligament of the Womb which descends on each side to the inguinal Glands, in which sometimes Venereal Tumors appear. Therefore *Celsus* says well, l. 4. c. 4. *If a Woman, when her Menstrua do not pass, vomit Blood, it is the best way to apply a Cupping-glass to her Groin.* Would you know the reason? you can scarce come to a place nearer the Womb, or more effectually avert the outrageous violence, which the uterine Blood offers to the Parts above the Diaphragm.

Tulpius.

V. A Woman whose *Lechia* stoppt, was bled in the Foot, and had *Platerus* his Powder for forcing the *Lechia*, given her in Bugloss-water; but instead of Sugar, an enemy to the Womb, I put in the *Anthera* of white Lilly flowers.

Bartholinus.

VI. When an Inflammation turns to an Abscess, some letting of Blood must be endeavored: Which indeed, for Revulsion sake, must be let in the upper Veins, except the Patient be lying in, and therefore be in danger of Fits; wherefore it is safer to bleed in the Foot. For formerly I saw my Master let a certain Plethorick young Woman, lying in, Blood in her Arm, whom, when we went to visit her in the Evening, we found dead of Fits.

Fortis.

VII. Whether may a Vein be opened in an Inflammation of the Womb? The Basilick Vein must be opened for revulsion and evacuation of plenitude. For though some open the lower Veins, yet because the opening of them draws the Blood to the Part affected, therefore we must abstain, at least in the beginning, lest from a greater Fluxion to the Part the Disease grow worse. Nor can revulsion be thus made, whatever *Fuchsius* and others think. But when the Fluxion is over, a Vein may be opened below, for evacuation of the conjunct cause. Reason tells us as much; for if in the beginning of an Inflammation revulsion must be made from the Womb, then the upper Veins must be opened. 2. In an Inflammation of the Womb the *menfes* must not be provoked, therefore the lower Veins must not be opened. And though *Galen*, 2 ad *Glauc.* 2. order Bleeding in the Foot, yet it must be understood of derivation; or of Diseases in the Womb wherein there is no need of revulsion. But if there be no plenitude, and the Inflammation be small, it will not be amiss to begin with the *Saphena*. But in a Woman with Child it is always dangerous to bleed in the Foot.

Sennertus.

VIII. *Avicenna* bids us use Vomits, but without doubt it is to make evacuation by a place farthest distant from the part affected. But we must take great care; for if they be gentle, they evacuate almost nothing; if strong, they make a great disturbance in the Body, whence more harm than good follows.

IX. When the Womb is ill of an Erysipelaceous Inflammation, the Diet must be of Ptisan, both the Cichories, Lettuce, with Bread, abstaining from Eggs and Flesh, till they have passed the increase and state. For I cannot commend *Mercatus* and *Mercurialis*, who, when the first 3 days are over, give Flesh, for they do not so soon pass the time of increase and the state, wherefore in the declension we may use them.

Ferdinandus, Hist. 4.

X. Parts full of Glands easily degenerate into fungi, the proximate subject of a *Carcinoma*, and if there be any fungus in the Womb, the fungus irritates it presently, and it pours out the *menstrua* in no less plenty, than if the true Birth were at hand; where-

by, nevertheless, since this fixt tumor is not at all expelled, it is necessary to have recourse to the Knife, and by the help of it to take out by the root, what cannot otherwise be extirpated. But all the Skill is, either to attempt such a Section; or rightly to perform it in such an obscure place. In which notwithstanding I saw it twice performed with as much security, and the fungus of that Part cut out by *Bernardus Ollularius* without any hurt to the Part, as if he had directed his Knife in the open light, and in a place most obvious.

Tulpius, l. 3. c. 33. and 34.

XI. I have this admonition to give concerning the falling out of the Womb, that it is scarce, yea altogether impossible, that the Body of the Womb should hang out of the *Vulva*; and therefore this Disease is not so frequent as is commonly thought. But Midwives, and most Physicians with them, are deceived (which *Roonbushius* confirms in his Observations) by the rugous *vagina uteri*, which after a hard Labour or an unskilful Midwife, being separated from the Parts about it, by the additional afflux of pituitous Humors (which we may often observe to happen in the lower Eye-lid) is so extended and increased, that the *vagina*, hanging without the *Vulva*, resembles some pyriform vessel. For the greater the falling out is, so much narrower the root of it is. And therefore when we are forced to cut it off for a Gangrene, it is done with little danger.

J. Van Horne & Barbette.

XII. Some approve of a Vomit, because it makes revulsion of the Humors to the upper Parts. And upon that account indeed it were good, but that it may be feared on another; because it is performed with great straining, and forces the Womb as much as sneezing: Yea, Experience has shown, that nothing is more effectual to bring away the Child quickly in a hard Labour, than to give a Vomit.

Riverius.

XIII. Physicians use a Semicupe of a Decoction of Astringents: which yet needs caution: for there is danger, lest the Womb in that posture be turned out of its place, especially while the Disease is in the beginning and new: but when it has held the Patient a long time, and she is guarded by a Truss, it may do her good.

Idem.

XIV. But concerning astringent Medicines, as well internal as external, we must observe, that they must be cautiously used, if the *Menstrua* come at certain Periods, lest they should be stoppt, and great mischief should arise from thence. And the time most proper for such Medicines is, when the *Menstrua* are past.

XV. A Woman had not been well Purged after her Travel, and when other People thought she was ill of the *Sciatica*, the Physician commanded the Midwife to search, whether her Womb were not slipped to the Hip, which she found was so: Therefore there was need of Chirurgery. She was set in a hollow Chair, and fetid fumes were placed below, and sweet ones held to her Nose; Afterward the Midwife, having anointed her Finger with Oyl of sweet and bitter Almonds, separated the Womb from the Hip, and placed it right; and then she lay awhile on her well side.

Lucilius Philaleus.

XVI. In curing the falling out of the Womb we must especially have a care, that the wax Candle or *Obturamentum* be not so thick, as by its continual attrition to cause the Whites or Ejaculation of Seed, whereby the Body must of necessity be weakened. But you cannot with all your Prudence either altogether or always prevent this mischief. Wherefore they seem to act with reason, who make a hole lengthways in the Candle, to make a fit passage for the Humors.

Barbette.

XVII. Emollient and Carminative Clysters are proper, if an Inflammation arise in the Womb from the suppression of the *Lechia*, and there be Pain with heat and pulsation; and they must be given now and then: 1. That the Excrements of the Belly may be carried off in time, lest by staying there they encrease

increase the Pain and Inflammation. 2. That the acid acrimony, which is peccant in every Inflammation, may be tempered by the steams of the Clysters, which penetrate the Womb. And 3. That the Parts distended by the Inflammation, and hitherto in Pain, may be asswaged.

Sylvius de le
Boc.

XVIII. To this purpose also Sudorifics of Crabs-eyes, *Antimonium Diaphoreticum* and the like will be proper; because they especially are good, above all things that are yet known, both to prevent and cure an Inflammation, adding always Opiates, which temper every sharp thing, and assuage all Pain.

Rem.

XIX. Fomentations also made of a Decoction of aromatick and emollient Plants are good for this purpose. And they ought to be applied with a great sponge or woollen cloth pretty hot to the bottom of the Belly, and the *Pudendum muliebre*, that their virtue may the sooner and more successfully penetrate into the Womb it self. Such Fomentations also may be applied in an Oxes Bladder half way filled.

Idem.

XX. Fumes made of the Stone *Pyrites*, red hot, quenched in Vinegar are wonderfully commended by *Galen* to dissolve all schirrous Tumors. Yet we must have a care that the Stone *Pyrites* be not a Leaden one; for then it would do a great deal of harm.

Riverius.

XXI. Sometimes upon the *Ala pudendi muliebris* there grows a swelling at first small, then vastly encreasing, soft, all of a colour, which may be handled any way without pain: And from the foresaid signs, and from the matter contained, I place it among the oedematous kind. *Celsus* calls it an Abscess, but I understand it to be a cystick one, or anomalous, and not suppuratory; for section, especially in these lax places need not be deferred for fear of a *Fistula*. A Whore had a Tubercle upon her *labium pudendi* as big as a small Pine nut, hanging by a base, lesser than the other extreme, which of a little thing had grown to that bigness in one year. I tied it hard with a string for one day, and the next day I cut it off almost stupefied, covered with a very thick skin, almost half an inch thick. It was cured as an Ulcer in 30 days.

Severinus.

XXII. *Philomenus* in *Ætius lib. 4. f. 4. c. 108.* held a stalk of wild Marjoram lighted at a Candle, to take away the Warts from his Wife's *Vulva*; yet not so as to burn them, but that they might receive the smoak.

XXIII. In the year 1629. *P. de Marchettis* cut a scirrhous swelling, arising from Phlegm, from a Whore, as big as a Gourd, which grew to the upper part of the *Os pubis*, and covered her whole Privy, full of Malignant Pusules, ulcerated at the root. He stopt the Blood by Canteries, applying Bole Armenick, Dragon's Blood, and the white of an Egg in Cotton.

Rhodius.

XXIV. Inflation of the Womb is best known by the Signs proposed by *Fernelius*. And when it is known, this experiment is excellent. Take a whole Nutmeg, not faulty, cut it into quarters, lay one of them upon coals, and let the Woman stradling receive the same by a Funnel into her Womb. For so, if not at the first time, certainly at the third or fourth, the Wind will burst out with a noise. In this manner I cured a young Woman at *Biel*, when all other Remedies had been tried in vain.

Hartmannus.

XXV. In a Cancer of the Womb if common Anodynes be not sufficient to assuage the most cruel pain, which sometimes will give no rest or sleep, we are often forced to have recourse to Narcotics, which in this Disease, because of the great heat of the Humours, are not so hurtful. I knew a Woman who had a Cancer in her Breast, who every Night for 4 Months took 2 or 3 grains of *Laudanum*, without any harm, to her great comfort.

Riverius.

Medicines especially made use of by eminent Physicians.

For a Cancer in the Womb.

1. A Cancer is cured by a stuck Frog, which they call *Glew* of the Water: They tie a Frog to a staff and expose it to the rayes of the Moon, that so it may be reduced to its first matter, in form like a Frog but looking like dissolved *Tragacanth*.

Gremb.

2. Oyl of Eggs much rubbed in a leaden Mortar, till it grow thick is very good for a Cancer, that is not ulcerous.

Mercat.

3. Take of Cows dung 4 pounds, herb *Robert*, Plantain, Housleek, Henbane, Purslain, Lettuce, Endive each 1 handful, River Crabs N^o 12, Mix them all together. Defil them in a leaden Alembick, and make a frequent injection into the Womb.

Parac.

4. In a Cancer of the Womb this is commended; Take of the Powder of Emerald, Sapphire and Bezoar stone each alike æqual parts. For 3 days let 3 or 4 grains be given in a little scabious, or *Cardus Benedictus* water.

Sennertus.

For a Pain in the Womb.

1. Powder of Harts-horn given in warm wine is very good for a pain in the Womb.

De Bry.

2. Nothing is better, when it comes from cold, than to take 2 scruples of Castor in Rhenish wine.

Forestus.

3. For a pain in the Womb let 4 ounces of oyl of Sweet Almonds and 2 ounces of Sugar be drunk. It eases a woman of her Gripes. ¶ A certain Woman applied fresh Horsemint heated and be-sprinkled with hot wine to the pained place, and the sick party grew well.

Gabelchovrus.

4. Lily root boyled in Oyl of Roses is very good for pains in the Womb, as I have often experienced. ¶ This powder presently takes away the pricking pain, which follows child-bearing; Take of the seed of *Ammi*, Parly, Ginger, Caraway, Long Pepper each alike quantity, Sugar, what is sufficient. Mix them. Make a Powder. The dose 1 spoonfull in Wine.

Varignans.

For a *Fistula* in the Womb.

Take of Oyl of Roses, Honey of Roses, Wax each 1 ounce, Myrrhe, Litharge of Silver each 2 ounces. Make an Unguent. ¶ This is an admirable and certain experiment, especially if the disease arise from driness, to fill some linnen bags with Barly, to boyl them in water, and to hold them warm, with ones hands, and apply them to the fissures for 9 dayes, or some Pap of flower and milk boyled together.

Rod. à Castro.

For a Grangrene in the Womb.

This Emplaster *de tribus farinis* is highly commended in this case; Take of the flower of bitter Vetch, Beans, first steeped in Vinegar and dried, each 2 ounces. when they are powdered, add to them of *Oxymel* 1 pound. Let them boyl gently to the consistency of pap. And if there be great putrefaction, add as much flower of lupines, of Salt 1 ounce, aloes, Mastiche, Myrrhe each one ounce and an half, root of round Birthwort powdered 1 ounce, *aqua vite* 3 ounces. Mix them. It wonderfully hinders corruption, putting always a little sublimate between the sound part and the corrupt: for this is of great use.

Weikardus.

For

For an Ulcer in the Womb.

1. In a foul Ulcer this is a good Remedy, which is made of Eggs, Saffron, Oyl of Roses, Goose-grease and the marrow of a stag. Foreftus.
2. Emplastrum *Egyptiacum* without the *Erugo* is very good against the Ulceration. Ægineta.
3. A fume made of such a Candle as this, and let into the Womb by a Pipe, to dry the Ulcer, succeeded well; Take of liquid *Storax*, *Calaminth*, Orrice each half an ounce, *Cinnabar* 1 ounce and an half, *Ladanum* 2 ounces, Coals of Willow 1 pound. Mix them. Make a powder, and with *Aqua Vitæ* make candles as long as ones finger, one of which will last an hour, sending out a fume continually. Saxonia.
4. For a Fœtid Ulcer of the Womb I have had certain experience of this Medicine; Take of red wine 1 pound, *unguentum Egyptiacum* 2 ounces, let them boyl a little, so the putrefaction is corrected, and the stinking smell of the Ulcer is taken away. ¶ This is a singular Unguent; Take of burnt Lead washed, prepared Tutty, Frankincense each half an ounce, powder them very fine; Then take Oyl of Roses, white Wax each 1 ounce, add of juice of Nightshade 1 ounce. Mix them with a leaden Pestil. Make an Unguent. Vigierius.

- Medicines.

I. I Was called to the cure of a Maid who had received a wound with a great knife in her Arm; which being sooner closed with some Balsame, than was necessary, her Arm swelled wonderfully, and grew so red and inflamed, that it always smoaked, and presently dried wet clothes, when they were applied to it: Yet it was cured, after the wound was opened again, because the extravasated Blood had not been taken out, and then it was cured as common Wounds. P. Borellus, Cent. 3. Obs. 25.

II. Although Balsame be a most commendable Medicine and approved of in wounds, yet it cannot safely be applied to all wounds, and at all times. It is good in the simplest wounds and where no Symptome, as pain, fluxion, &c. concurs; for seeing it is a hot Medicine, it might cause many Symptomes: It is good also, where nothing extraneous sticks in the wound; for because it is the faculty of Balsames to contract the Lips of the wound, and to hasten consolidation, when any extraneous thing remains, presently grievous Symptomes arise. In fleshy parts therefore, cleansing must be expected, as also in contused wounds digestion, suppuration and cleansing. Therefore Balsame is neither good in the beginning nor in the entcrease, except the wound be simple and in a fleshy part. Hildanus;

III. Among Empirical Medicines found out by the Moderns, especially by the Germans, *Emplastrum Stipticum* or *Fodicationum* is not in the meanest place, than which some affirm there is nothing better extant in *rerum natura*, especially *Crollius*. That it, as also *Sticticum Paracelsi*, is most excellent, I do not question: Only I say this, besides other mischiefs it often causes a sharp *Ichor* and a *Meliceria*; not that the Plaster of it self is the cause, but because it is applied without reason: For when Surgeons use it from the very beginning in wounds of the Nervous parts to the end of the cure, they raise most grievous Symptomes. ¶ One received a wound in his Arm, where the axillary Vein and some Nerves were cut. He fell into the hands of an Empirick, who boasted, he would happily cure the wound with this Plaster only: It was quickly cicatrized indeed, but his Arm presently swelled and grew painful, and at length a Fever arose, then there was a new fluxion and Inflammation, and pus gathered within the wound and putrefied: And then it corroded and opened a Vein, which bled so much, that the wounded man died. ¶ A young man in a quarrel received a wound on the right side of his Back bone about the fourth vertebra: A barber-Surgeon would cure it with *Emplastrum Sticticum*, but quickly of a very broad wound it became a narrow *fistula* deep and exceeding painful. Idem.

IV. Some admit of vulnerary Potions, only in those wounded parts, to which they can reach, as in the Gullet, Stomach, Guts, where, in a manner, they serve instead of Applications; but in external parts they reject them. First, because there is no mention of them in the Writings of the Ancients. Secondly, because of their distance, they can never come to the Limbs and Head. Thirdly, because, among the Medicines whereof they are made, there are both hot and opening things, as Betony, Speedwell, *Carduus Benedictus* &c. and astringent things, as Comfrey, Wintergreen, Horsetail, Tormentil, &c. so that it is not evident, of what faculty they ought to consist. Fourthly, because most of them are astringent, they will do more harm by obstructing the Bowels, than they can do good. Indeed it must not be denied, that little mention is made of these Medicines among the ancient Physicians; but this is not sufficient to reject them, for the Moderns have found out many usefull Medicines which were unknown to the Ancients. And though they do not touch the wound, as topical medicines do, yet they may reach to the wound by the Veins. Neither, because of the astringent virtue, that some

of them have, need we fear, that therefore we cannot reach to the out parts, or that they will breed obstructions in the inwards; for this inconvenience may be avoided by the mixture of other things with them, which have an opening vertue. Nor then, are the vertues of all Medicines to be esteemed from the first qualities or those that depend upon them, but from their specifick qualities, which Experience alone suggests. "These Potions, says

"*Paræus lib. 18. c. 28.* though they do not purge "noxious Humours by stool, yet they are very effectual in cleansing of Ulcers, and preserving them from the filth of excrementitious Humours, in purifying the Blood, and in cleansing it from all *Ichores* and impurities, in knitting broken bones and restoring the Nerves to unity. And by and by. "These Medicines by their admirable and almost Divine vertue so purge the Blood that by it, as by a fit and laudable matter, flesh, or any other substance, that is lost, may readily be restored, and the part recover its pristine unity. And the thing that these Medicines do, is, to waite the exceeding moisture of the Blood which is not so fit for glutination; to afford good matter, for the generation of flesh; and by moderate astringency, to hinder any fluxion to the wounded part.

V. But although such Potions do wonders; yet great Symptoms, and especially Dropicks of the Limbs, do follow the unseasonable use of a traumatick decoction. For since from some plants it has a great vertue of drying, binding, and agglutinating; and from others, and from the wine, which is its vehicle, of heating; It is evident, that it is then improper, when we should attend suppuration and digestion, which is thereby hindered and kept back, moreover the Blood and Humours are heated, and pains and Inflammations arise. But when the wound is digested and suppurated sufficiently, and free from all Symptoms, when there is place for absterfion, mundification and consolidation, then they become a good Medicine. It must also be observed, that because they greatly bind and dry, they are very bad for such as are ill of obstructions of the Bowels; for by the same vertue they retain the excrementitious Humours in the Bowels, hence Gripes, hypochondriack winds, and a thousand other inconveniences arise: Wherefore the Body must be prepared before the use of them.

VI. *Cæsar Magatus l. 1. de vulner. c. 38.* and *Septalius* following him *l. 8. Animad. Med.* disapprove of the old way of curing wounds, used hitherto by all Physicians and Surgeons who every day, at least once, do cleanse and wipe them, and when they have applied new Medicines, bind them up again: And they blame *Galen*, that passing by the indication of most moment, he was only intent upon the lesser, that is, absterfion of the excrements and filth, the cause that breeds them being neglected, and all care of conserving the temperament and innate heat of the part: Which, and the strength of the part, if they be taken care of, they think there will be a far less increase of excrements. And they think the heat of it will be cherished, and strength will be added to it, if it be hindered from expiring, and its quality be preserved. Which they think they are able to obtain, by making up the defect of a natural covering with a Medicine analogous and familiar to the temper of the part; by means whereof the heat may be cherished, and its quality may be helped by its like. Whence they gather, that for to defend this heat, wounds must be seldom opened, lest the ambient Air do hurt them. But, since the same Persons confess, that most grievous wounds have been cured by the old way of cure, and they cannot deny, but this new one has only place in simple wounds, and where the wounded party is of a good habit of Body, where great Vessels are not hurt, and the Nerves are whole: Besides, there

are many wounds, by their own confession, which Nature is not able to cure, unless the impediments be removed by a Surgeon, as if the Body be *Cachymick*, whence comes great store of excrements, which cause Pain, Corruption of the Part, Inflammation, Worms, proud flesh and the like: Finally, since the exceptions exceed the rule, which very rarely allow the use of this new way, we must insist upon the old one, approved for many ages.

VII. Some reject the use of Tents in wounds.

1. Because they need not be used to keep open the orifice of the wound, when it is always open, whether the Physician will or no; nor to make the Medicines stick to the sides of the wound, seeing they may be so melted, as conveniently to be dropt in. 2. They are troublesome to the part, therefore Nature alwayes endeavours to expell them. 3. They cause pains, whence come new fluxions. 4. When they are full with bad Humours, they hurt the wounded part: And they hinder evacuation of the Pus, which being kept in, grows worse. 5. *Hippocrates* and *Galen* are silent concerning them. On the contrary they seem necessary.

1. That the orifice of the Wound may be kept open, and that there may be a passage for the Pus. 2. That the Medicines may touch the wound every way, and reach to the bottom. 3. That the upper part may be hindered from closing before the bottom of the wound be filled. For a decision, we must know, that in wounds, which are superficial, freight, and that breed little pus, they are not necessary, nor should the cure of the wound be retarded by putting them in: But if the wound be deep, oblique, and if much pus be bred, they are altogether necessary, that a passage may be kept open by them for the pus, and a way for Medicines to the inside of the wound, and that the orifice of the wound may not close and heal up, before the inner and lowest part of it; which things if they be neglected, and pus and excrements be kept in the wound, they may be the cause of great pains and dangers. To the reasons, that deny them, you may reply. 1. That oftentimes wounds, according to the various posture of the Patient, when he was wounded, are anfractuons and oblique, so that though the sides and lips of the wounds be not then grown together, yet they so touch and press one upon another, that there is no passage for the pus. And for the same reason Medicines cannot reach to the bottom. And fluid Medicines are not alwayes proper, seeing they are easily washed off by the *Sanies*, and the thick and viscid, being laid on the tents, stick longer and faster to the wounded parts, and better exert their vertue. To the 2 and 3. If the tents be not over thick, nor press and distend the part, there will be no trouble or pain or fear of fluxion. Again, if all things should be omitted that create pain, by the same rule sutures and swathes, and bandages should be omitted. To the 4. When they are fouled with pus, take them out and put in new. To the 5. The use of them may be gathered from what *Galen* delivers concerning the cure of wounds. And as for them, who hold that the upper orifice of the wound is never closed before the lower part be healed, They may be opposed by experience. *Hildanus cent. 3. obs. 7.* recites two examples of wounds, whose orifices were quickly healed, the wound within being not yet healed, whereupon pus gathered within, and grievous evils arose from thence. ¶ In all wounds, especially those made by incision, the skin is easily and quickly contracted at the beginning. 1. Because it is Membranous. 2. Because Nature endeavours by the tegument of an ignoble part to defend the more noble Parts underneath from the injury of the Air. But flesh cannot so quickly heal up: for in the very wounds made by incision there

Sennertus.

Sennertus.

there is a sort of contusion, but bruised flesh must of necessity putrefie and turn to *pus*, which cannot be done but in time. Therefore the skin of wounds, especially of such as are made by incision is contracted at the very first, and the Humours, which run out of the wounded part, are retained, grow hot and sharp, and hence comes an efflux of Humours, causing grievous Symptomes. ¶ In curing wounds made by a prick we must make great account of Tents, and we must observe what *Hildanus* sayes, that they must not be so thick as to fill the whole wound, but it is sufficient that they fill about 3 parts of it towards the *superficies*, the 4th remaining empty, that the Lips be not extended. The depth also of the wound must be searched, and care must be taken that the end of the tent do not touch or bear upon the bottom, especially if a Nerve or any Nervous part be laid bare. Therefore they must be made of the finest lint in form of a Pyramid, that they may only fill about the 4th part near the bottom, lest the breeding of flesh be hindered: For this cause, when the wound is digested, the tents must be shortned a little every day. Tents are also made like a reed hollow through, either so made with Plasters, or with an Iron plate tinned over, that the running out of *pus* may not be hindered, even when the wound is not unbound. ¶ And very narrow wounds, because they do not receive a large Tent; and being small, because it is flexible, it cannot reach to the bottom; therefore they take a piece of Gold or Silver wire of a length according to the depth of the wound, and wrap it in lint anointed with some Anodyne, digestive oyntment, and put it into the wound.

VIII. Although Tents be of use, yet they are not alwayes necessary, yea sometimes hurtful. A Villain had given a young Woman six wounds, by pricking rather than cutting, in which this was peculiarly observed, that she could not bear Tents, when they were put in according to custome: Which it was necessary to take out at Night, unless you would have wholly kept her from sleep, whereinto she fell as soon as they were taken out, and linnen clothes dipt in Spirit of Wine were only applied outwardly, by benefit whereof before the twelfth day her wounds were both happily filled up with Flesh, and firmly covered with skin. Hence I took occasion to admire the folly and madness of some Men, who, that they may not be thought to do nothing, fill green wounds with great store of Tents, and so they do not heal them, yea, the mutual contact being thus hindered they hinder the necessary coalition.

IX. I have seen no ordinary Surgeons, who have set themselves a certain time and number of dayes, to finish digestion: when which time has been over, they have gone to mundifiers and abstersives, though the wound were not sufficiently digested and suppured, to the great inconvenience of their Patients: For digestion is not equally perfected in all subjects, but in some sooner, in others later. If therefore such things be made use of before their time, they will irritate the wound with their acrimony, they will raise a new afflux of Humours, and so will disturb nature, that of a simple wound it will become a cacoethick Ulcer. Therefore I happily proceed with digestives, and asswagers of pain, for the most part to the end of the cure: By this means, not omitting Universals, I am secure from all Symptomes.

X. *Celsus*, when a wound is inflicted, uses no repellents or repressers, to hinder Inflammation, which Surgeons now adayes commonly use about the place that is hurt: but he cures it only by taking away Blood, averting the fluxion, and also by purging. Which at this day is done with good success by the most learned Surgeons, Repellents being utterly repulsed, lest the Heat of the hurt

part, which is Nature's (who is the Curer of Diseases) chief instrument, should be weakened.

XI. I have seen wounded Men after plentiful Bleeding, cured in a few dayes, without fear of Convulsion. I saw a certain Surgeon in the Camp, curing a young Man, who was wounded in his Shoulder, to whose wound his Friends had immediately applied Linnen Clothes to stop the Blood, and he removed the Clothes immediately, while he was feeling, for I know not what with his Finger in the wound, in the mean time disappointing his Friends, who complained of the large effusion of Blood, he let the Blood run as much as the Patient could bear, without fainting, well knowing, that thereby he rendered him safe from Convulsion, and about 8 dayes afterwards I saw him walking about a Room. I would have the Masters of Wounds to know this, that they may take away Blood, if it cannot be had conveniently from the wound.

XII. If the bleeding of wounds do not stop with Medicines, some use Causticks, and thereby close up the orifices of the Vessels; but this is no safe way. Because how much of the part is burnt into a Scab, so much natural flesh goes off the Part in a Scab, and then the orifice of the Vessels is left open again and destitute of Flesh, and often a new Hæmorrhagy, which cannot easily be stoppt, is raised. Of these Medicines they may the safest be used, which being burnt have got a Caustick virtue, and not burnt have a very astringent one, but little burning: such a Medicine is crude Vitriol, which some strew crude in powder on wounds, others dissolve it in water, and wet Linnen Clothes in it, and apply them to the wound: And Vitriol especially either in powder, or dissolved in some convenient liquor, is good in wounds, when the orifice of a Vessel can be stoppt neither by compression with the Finger, nor with the fufs-ball, called *crepitus Lupi*: and vitriol, dissolved especially in Liquor, does penetrate the hurt Vessel. But we must have a care that the Nerves, if any be there, be not hurt: therefore in deep wounds, if there be Nerves, other things of the like virtue, must rather be injected.

XIII. Some are against Purging in Wounds, and they fear lest the Humours, being disturbed thereby, should flow more to the wounded part. But *Hippocrates* l. de affect. de fract. c. 48, and *Galen* 4. Meth. 4. and 6. approve of it. And Reason perswades it; for if hot, thin, and bilious Humours abound in the Body, they fit the Blood for motion, they easily grow hot with pain and waking, and give occasion to a Fever; and such Humours especially must be Purged, and it must be done at the beginning before a fluxion of Humours, and the coming on of the Fever. But if the Fever be come, you cannot conveniently, or certainly not without danger, give a Purge. And we must abstain from hot Purgers, lest a flux of Humours be raised, and they should dispose the part to Inflammation. *Manna*, Syrup of Roses, &c. are sufficient.

XIV. For making a Cicatrice, dry Powders are used without any preceding humidity, both because we would dry, and because the Powder sticks well enough to the parts; for the parts that are not covered with skin, are ever moist, and that Moisture retains the powder, that is strewed on it, well enough. And such Powders (which are truly and properly Epulotick) are made of things, that bind, close and condensate the flesh, and harden and dry it like a *callus*, such are the Bark of Frankincense tree, rind of Pomegranate, Galls, burnt Oyster-shells, and burnt Coral. Also Myrrh, Litharge, *Diphryges*, burnt Paper, burnt Alum, Vitriol and other things which wait and eat the flesh, if they be powdered exactly fine, and be only laid on the part affected with a gentle touch of the end of a Probe, for if one should use them in a greater

greater quantity or courser, they would bite, and waste the flesh, and hollow the Ulcer: And here we must observe, that *as ustum, squamma aris*, and *flos aris* must be waish, to cause a cicatrice, that they may lose some of their caustick faculty, and may be a more Epulotick Medicine: And you may use such Medicines in dry bodies, and parts that are not very sensible.

Rondeletius.

XV. Sowing must not be used, before the wound be well cleaned within, as *Celsus l. 5. c. 26.* sayes, namely, that no concrete Blood may be left there, for that would turn to *Pus*, cause Inflammation and hinder the closings of the wound. I say it is not so well to sow up the wound presently as soon as they look on it, as most Surgeons commonly do. But this inconvenience of grumous Blood happens most in venous places, and not so much in others. 2. But that the wound, when it is sowed up, may discharge its necessary *sanies* dayly, many put in a tent above and below; a thing which is contrary to sowing, and is inconvenient to beauty. 3. We must lay a small thread made of clean Cotton dipt in Honey of Roses, or in some other vulnerary liquor, half way in all along the wound, then we must pass a needle and a thread through the Skin, over this, and make a knot, and so do as often as there is need of any more Suture.

Severinus.

XVI. A Boy was cut for the Stone, and the wound could not be healed; for the edges of it were a callous stone, the Urine being voided that way. Therefore the crusty Lips were made bloody again by the industry of another Surgeon, and when the stony edges were cut off, it afterwards closed up well; and the Urine came by the proper passage.

Keremmannus
de Calculo,
c. 11.

XVII. Sometimes it chances, that a Wound is reduplicate: Now I call it a reduplication of the Wound, when there is only one Wound in the Skin, and two in the Muscles, or which I remember I have seen, three. This reduplication happens, either because of the tremulous hand that inflicts the wound, or because of the motion and agitation of the Wounded person: Such wounds are dangerous, if the Surgeon be either ignorant or negligent. A Fencing-Master going to part two Noble Men, who were quarrelling, was run with a sharp Sword into the left Arm: When the bleeding was stopt, at the perswasion of his friends he only used a Traumatick Decodion. At first the cure succeeded as well as he could wish: But about the third day an Inflammation arose, violent pain, a Fever, reaching to Vomit, &c. Wherefore, when I was called to his assistance, I found all his Hand and Arm swelled, the muscles also of his breast Sympathizing: Having put in my probe, I found a wound a span long reaching towards his elbow, and treated it according to Art. But after several dayes, when the Symptomes did not abate, I reckoned, there must something more there than yet I knew, be in it; therefore I search the wound again with a silver probe, and I find a *Sinus* (but not of the same depth) reaching from under the cephalick vein toward the Median. In the *Superficies* therefore there was only one wound, but in the Muscles there were two. Therefore when I had discovered this wound, I put a tent into it anoynted with a proper unguent, I anointed the Arm, &c. and I happily finished the cure with Sarcoticks and Epuloticks.

Hildanus.

XVIII. A lusty Man of Seventy had received a contused wound with a Club, on the upper part of his Shoulder, with bitter pain, and lividness of the Part. A Vein was immediately opened and *Emplastrum de Camino* applied, the next day he took a gentle Purge: The pain persevering, the part was frequently anointed with oyl of Wax warm, applying the foresaid Plaster upon it, and so with-

in Twenty four hours his pain was gone, and the part came to its colour.

Riverius,
Cent. 3,
Obs. 19.

XIX. If the Wounds in the neck be made by a Thrust, and do not cause present death, this is a sign the jugular Veins and Carotid Arteries are not hurt, therefore we must take great care, that we hurt them not. For though they do not go all over the neck, yet a long and thick Tent must not be put in, but a very short one, which may go no deeper than the Skin, which at the beginning must be dipt in the white of an Egg, applying a double linnen cloath all over the neck, spread with the white of an Egg, bole Armenick and dragon's Blood; then take away a little Blood, and give a gentle Purge the next day, after which for 2 dayes the Remedies applied to the wounded part must not be changed, because most usually the linnen cloth will serve, spread every day with the white of an Egg and the aforesaid powders. The Diet must be only Barly Ptsan twice a day: His Drink, Barly-Water in a small quantity. But if afterwards there be any fear of Inflammation, you may bleed in the other Arm in a due quantity: And if Pain be violent, and the strength will permit, Cupping with scarifying must be used. For the breeding of *Pus* must be hindered with all our Power and Skill, as it corrodes the Veins and Arteries with imminent danger of death, as I have observed in some, that have been ill treated by unskilfull hands, while they thrust very long Tents, whereby much *Pus* was gathered, which consumed the Veins and Arteries, and was the cause of Death, so that therefore after 2 or 3 days I remove that short Tent, and then spread the Linnen cloth with Plaster of Ceruss, repeating another in the like manner doubled the same way and spread with the white of an Egg and the foresaid Powders, with which in the space of 10 dayes at most I use to cure these wounds; Yet always observing a very thin Diet, lest the Humours flow to the wounded part, and being converted into purulent Matter, do erode the Vessels. But if the Wound go quite through the Neck, I use the same Method, that is, I put a very short Tent on either side, in the same manner, as I described before. You must remember also, that you must never search these Wounds with a probe, lest, as it may easily happen, you break a Vein or Artery, to the hazard of life. By which Method I have cured many; moreover I Marchetti have seen many dy, who have been treated in a Method different from mine.

Marchetti,
Obs. 37.

XX. *Felix Wertius* in Wounds of the fingers and hands disapproves of Tents without distinction. How erroneous and dangerous this opinion is, I will declare by the following example. A Merchant of *Colten* struck the needle of the ballance into his hand, he presently went to no Surgeon, nor kept he the wound open with a Tent. The *Superficies* of the wound therefore being closed, the pain encreased about the fourth day, then came a flux of Humours, a Fever and an Inflammation, so that his hand was exulcerated in several places, and was not without a great deal of difficulty cured. ¶ *D. N.* prickt the Palm of his hand with a penknife, and no tents being put in, by reason of the narrowness of the wound, such Symptomes followed, that he was in danger of his life. ¶ A Country fellow prickt the top of his fore-finger with a thorn, the *Superficies* of the wound quickly healed; but *Pus* gathered about the nervous parts, hence came Pain, Inflammation, and a Gangrene, when his finger was cut off at the root he was well. ¶ A Country-man run a Thorn into his Ankle, and the Prick being too soon closed, there followed Pain, Inflammation, Gangrene, and a *Sphacelus* of the whole Leg, which, when he refused to let it be cut off, he died in a few dayes.

Hildanus,
Cent. 4,
Obs. 74.

XXI. In all wounds of the Breast or lower belly, we must altogether abstain from injections with a
P P P P Syringe

Idem.

Syringe for something might get into the hollow, and there raise grievous Symptomes, to the hazard of the Patient: ¶ Yet *Scultetus* used them successfully in wounds of the Breast, as appears from *Obs.* 50. both for stopping of Blood, and strengthening the thorack Parts.

XXII. A certain Liquor runs out of the wounds of the Joynts either ill treated, or ill-conditioned of themselves, which *Celsus* calls *Ichor* and *Meliceria*, which renders the Cure very difficult: And it proceeds from the superfluous Nutriment, which Nature has destined to the Bones: This therefore must be strongly dried up, lest it cause Putrefaction in the Parts adjoining, and caries and holes in the Bones. *Fabricius Hildanus* will have it, that a Flux of this water never appears, except the Surgeon or the Patient have erred. Therefore it cannot be thought, that it always proceeds from superfluous Aliment, as such, or left to it self, but from a corrosive, ferous, ichorous humor, into which even the Nutriment turns, when consolidation is hindered, but not therefore, because that runs out which should stay within, that is, the Aliment, but because that preterfluent water corrodes and exulcerates the circumjacent Parts, and the clammy humor, which is naturally in the Joynts. When therefore we find such an humor in wounds of the Joynts, we must endeavour to avert it by all means, by Purging the Body, opening a Vein, and regulating the Diet; which most Surgeons neglect.

Hildanus.

Paræus, l. 24. c. 19.

XXIII. A Surgeon of Orleans told me not long since that he cured an Apparitor of a wound in his Ham, by which the Tendons, that bended the Ham, were quite cut in sunder: And he went about the Cure in this manner, He ordered his Patient to bend his Knee, then he sowed the ends of the cut Tendons one to another, and then he kept the Limb in that posture, and treated it with that Skill, that at length the wound was brought to a Cicatrice, the Patient not halting at all. A fact truly memorable, and carefully to be imitated by a young Surgeon.

Hildanus.

XXIV. Between the two *Lamine* of the *Calvaria*, above the Eyes, there is a Cavity in some very small, in others large: Wounds that reach to these Cavities are difficultly cured, and often turn to *Fistulae* and *cacoëthick Ulcers*; for a Matter is gathered in them (unless the Surgeon be careful and skilful), which, if it contract Putrefaction, corrupts the Bones and Cartilages. The wounds of these Cavities have so near affinity with the Eyes, that I have seen the purulent Matter, which falls from the wound to these Cavities, and there putrefies, acquires acrimony, lodge in the *Membrana adnata*, and turn the Eyes out of their Orbits.

(See Wounds of the Head, BOOK III.)

Amatus Lusitanus, Cent. 2. Cap. 25.

XXV. A Soldier had a Ponyard struck into his Shoulder near his Collar-Bone. The Surgeon, when he drew out the Ponyard, and observed concrete Blood, and considered that the wound had reached the Cavity of the Breast, he pitched upon Incision between the third and fourth Rib, and learnedly indeed: for Blood very much concrete was contained in the Cavity of the Breast, which by making a new Incision in the Breast was got out thereby, and the Patient was cured in 40 days.

XXVI. We know, and Experience also testifies, that Blood and *Savies* run from the wounds of the Abdomen into the Cavity of it, and often fall into the Groin, wherefore we use to rub the Groin, and apply Plasters to it, that the Matter gathered there may be dissolved, discussed, and so be insensibly evacuated. For one wounded in his left *Hypochondrium* was cured by a Barber-Surgeon, internally only, no outward things being applied, but in the beginning. The Wound indeed healed, but Matter gathered in his left Groin. The Shaver neglects

this, and sends the wounded man away, as if he had been perfectly cured. But after he had undergone a great deal of trouble, the wound opened of it self, and it run variety of Matter: which being healed, greater store of Matter was again gathered about the Groin, and swelling, pain and tension was caused there, with difficulty of Breathing, straitness of Breast, and sometimes a small Swooning. I give a Decoction of the Wood and vulnerary Herbs, and then I apply emollient, dissolving and discutient Oyls and Plasters, by the diligent use whereof, he was at length restored to perfect health.

Ph. Salmuth, Cent. 3. Obs. 84.

XXVII. A Tailor gave his Wife a wound with a Knife in the right *Hypochondrium* above the *Oleum*, in the Night. The wound was bound up; in the Morning, when the Surgeon took off the Plaster, her ordure followed; the wound being dilated, the Gut *Ileum* appeared hurt. I had a mind to make trial in a desperate case, I order the Gut to be carefully sowed to the Skin, and a slice of fresh fat Pork being put between, so as there might be passage for the Excrements, I order the Skin to be closed, I prescribe vulnerary Potions, by which she was cured to a Miracle, and within a few years she was brought to bed of two Children.

D. Maiguanquez, mif. cu. ann. 72. Obs. 176.

XXVIII. I know, many think the coalescence of fibres is fabulous, who yet are either ignorant of Surgery, or have never made trial of a thing which it is not difficult to do. *Gab. Ferrara Observ. Chirurg. l. 1. cap. 17.* shews the way how to sow great Nerves (perhaps he means Tendons) Mr. *Galthier* Surgeon to the Count *de Rabatta*, General of the Imperial Army, 1667. told me that two Persons had the Tendons which bend the wrist, and one of those which bend the Leg, cut in sunder, who, when the Tendons were artificially sowed, did recover their perfect Motion, and the way may be easily learned in Dogs. Not long since some Students in Surgery in this place tried it, they took a Dog, and cut the great Tendon asunder, which moved his left Leg, they took hold of it with a pair of Pincers, and in the Method delivered by *Ferrara*, they accurately joyned the ends of the Tendon, that were cut, with a single thread, which grew together again, without any Balsames or Plasters, only by the Dog's licking of it, and he runs without any Impediment, only in the place, where it was cut, one may feel a knot, like a *Ganglion*.

Wepferus, de Cicuta Aquat.

XXIX. A Gentleman of about 35 years of Age was wounded with a Rapier on the right side of the *Aspera Arteria* into the internal Jugular, through his Neck, it passing out below the last *Vertebra*. The Wound was small, yet bled with a full stream, A Servant stoppt it with his Fingers, whilst I made Dressings ready of our common Astringent Powders with the White of an Egg and a little Vinegar, spread upon a Pledgit of Lint, and an Emplaster of the same, with Compress and such Bandage as it would bear. The Wound behind bled, when that before was dress'd. I applied the said Medicaments to that, and caused them to be held close till they were dried on. Then we put him to Bed, and kept him cool & quiet. I used all my endeavors for the counteracting his Blood, as is usual in such cases, and dress'd him but once in 4 or 5 days, unless I were necessitated by the bursting out of the Blood: yet he bled at times about 16 or 17 days. His Wound by the *Vertebra* of the Neck healed in few days; and the other near the *Aspera Arteria* was cured by this way of Agglutination the 19th or 20th day.

Wifeman's Surgery, p. 354.

(For Wounds of the Arteries see *Aneurisma*, BOOK I.)

XXX. N. 17 years of Age, of a choleric Complexion was shot with a single Bullet in the right Thigh, eight inches from the Groin, and reaching to the opposite side. The Parts were much torn, especially the greater Artery, whence followed an Hemorrhage

Hæmorrhage of Arterious Blood. *Signior John Trullus* being called, found the Wound taken care of by a Barber-Surgeon, and therefore meddled not with it till the next day, when coming, and loosing the Bandage, the bleeding was stopt, he finds the Parts very much red and swelled, so that the Pulsation lifted up both the hands, when laid on the swelling, wherefore he presently suspected, some Artery was wounded. Cooling and Astringent things were applied, he was kept quiet, the Wound was not touched for several dayes, though sometimes 3 or 4 Ounces of Blood would start out of it self, and presently stop again. Yet in dressing there were still the same Swelling and Pulsation, the Fever as well as the Pulsation encreasing daily. Many were called to his assistance, but the greater part left the business to Time and Nature, except *Signior Trullus*, who advised the laying of the Wound open, for to find the Artery; which opinion the rest rejected. Therefore applying the same Medicines again, the Wound was bound up, and they deferred the dressing it, till the Seventeenth day, and then we declared with unanimous consent, that the course must not be altered: Thus the Blood stopt for 13 dayes, after which it bled as it used, and stopt again of it self. On the 30th day the Wound was dressed, and we found the Swelling softned, which we were in hopes would suppurate, and when suppuration was made, that flesh would be regenerated, and that the wounded Vessel would (as it usually is) be closed up by it; but our Expectation failed us: And when his strength decayed daily, when his Fever grew higher, and his Body wasted, we then placed all our hopes in dilatation of the Wound, that the Artery might either be sowed, or tied or cauterized, and the Blood might some way or other be stopt. All things being in readiness for a work of so difficult a Nature, we go about it. The Artery about the Groin being found with the touch of the Finger, we follow it below the Groin, tying a hard *Splenium* upon it, with a strong Ligature, and we bind the Thigh after the manner of them, that go about the cutting off a Limb, that the Vessel being straitned by the pressure, might bleed the less in the operation: Then we marked the place to be laid open, with ink, and the said *Trullus* cut it, when it was marked, and presently a vast quantity of grumous Blood appeared, at least Six pounds in weight, which I took away, besides abundance of Arterious Blood, which sprung afresh from the Artery, and, when the grumous Blood was removed, showed us the way to the Artery, which being found, the Blood was stopt by a strong pressure of the Finger. *Trullus* violently compressing the Groin, and we had the Artery in view, which I separated from the adjoining Vein, and tied it first above and then below; using the same cautions which are used in *Varices*: It was torn two parts in three, only one remaining whole, which the next day after a Ligature was cut in sunder, lest the part should be contracted, before it putrefied, the rest of the Cure was performed like a simple Wound, and perfectly compleat in six Weeks.

XXXI. An exceeding spare Diet is proper for Wounds in general, concerning which *Hippocrates Lib. de Aft. n. 37.* said, *Afflict the wounded with hunger*, says *Cornarius*. But take good notice, the Man means not that all wounded Persons should be kept with a like low Diet, but according to the measure of the wound, and the danger of Inflammation; that is, a sparser Diet must be given to a greater hurt, and a more plentiful to a lesser; therefore Fasting, if it can so be, is most proper for Wounds, that are most in danger of Inflammation and Death: VVhich danger as it is less incident, we may augment the Food, and as security proceeds, we may proceed with a fuller Diet. Wherefore the Diet of the wounded has no small Latitude, to which the Indulgence of the Physician, I should rather say the Pru-

dence, should give Licence. But now, when a man would prescribe the measure of a very thin, or a very full, or middling Diet, he must above all things consider the Times: For if a Man be to be cured in the beginning, *Celsus* will quickly tell you *l. 5. c. 16.* that hunger and thirst are requisite; Nor let any man contradict it, that *Celsus* spake of such things, as must be observed in acute Diseases: For Wounds, if they be grievous ones, are much of the same Nature; by a good token, that *Hippocrates de Fract.* says, they are worse on Critical odd dayes, like acute Diseases. Another thing also shows it, that after great wounds, a man is quickly and easily cast into acute Diseases, as an acute Fever, Phrensy, Pleurisy, Stone, Convulsion, and Inflammation of the Parts. It is meet therefore, that there be a like form of Diet in both, though there be a different reason for the use in them: for indeed in Acute Diseases, properly so called, we use a thin Diet, lest coction of the peccant humor be hindered, and lest the work of Nature, who bestows her self therein, should be hindered: But Abstinence is approved of in Wounds, lest humors should gather and cause Inflammation, or Pain, and sometimes effusion of Blood, if the case will suffer it. There have been, and are, several of a contrary opinion, who maintain, that they that are weakned, and have suffered effusion of Blood, must be strengthened with food, and not further weakned with Abstinence. And we do not dissent from them, when Patients stand in need of refection of their strength; not being unmindful, that, when the Strength is good, Nature does all things, which conduce to Health: but we would only have it considered, what *Galen Comm. 1. Aph. 4.* said, "It seldom so happens, that we encrease the Strength, which we find in Sick Persons, but almost always we do our endeavour indeed to retain and maintain it in long Diseases, only in Acute Diseases we keep it a little low, for if in these we should contrive, always to keep it as we find it, or to encrease it, without doubt we should encrease the Disease. But, as we showed before, Wounds do both answer to acute Diseases, and often end in acute Diseases. Farewel therefore the Opinion of those Men, who will have healthy Mens Diet given to the Sick.

XXXII. And there are some who will allow Wine to wounded Men, which yet *Celsus l. 1. c. 26.* condemns, "Wine is hurtful to all, while there is a Fever, and while there is an Inflammation, and even till the cicatrice, if Nerves, or Ribs, or Muscles be wounded: Though, if a deep wound in the flesh, or a slight one in the skin, be of a safe Nature, it may be given, so it be not very old, and given moderately it helps to fill up. But the drinking of strong Wine who in his wits would allow? If I may not call it Poyson, *Celsus l. 5. c. 26.* has said in expresse terms it is very hurtful. And *Galen m. m. l. 4. c. ult.* writes, that an old Epigram says, Wine has the force of Fire; wherefore what more unadvised could be done, than to give them Wine, in whom it should be our greatest care, and study to prevent a Fluxion of humors and an Inflammation? Let Wounds therefore be treated without VVine, without Flesh, and Eggs, and in short, without these or any other Meats, which breed Blood, and are of much and strong Aliment.

XXXIII. If the Nerves be wounded, they must abstain from Vinegar and Acids: for, besides that reason tells us, that it wounds and vellicates the Nerves, and that in penetration it exceeds most things, several instances have also taught us, that Nerves which are not wounded, but are otherwise affected, are hurt by Vinegar, which I found by Experience in a Sicilian Notary, and in several others.

XXXIV. But all Acids should not be excluded, such as singularly check the violence of the Bile,

that most naturally irritates and troubles the wounded Parts. And therefore several of the Learned do order Bread and Meat to be prepared with juice of Citron, Lemon, Verjuice, sowre Pomegranates, and other sowre things; but the case is otherwise in Vinegar, which, because, it is very penetrable, may vellicate and make the place smart with its sowreness, and so do more hurt.

Idem.

Mayerne,
Tract. de
Laudano,
M.S.

XXX. *Laudanum* given in painful Wounds, restores Nature by causing gentle rest, and strengthens her faculties, and accelerates her Operations, Suppuration, Deterfion, &c.

Medicines especially made use of by eminent Physicians.

Balde.

1. Green leaves of Tobacco are good, applied to all Wounds.

Boëlius de
Boët.

2. There is an admirable *Arcanum* made of Crab's-Eyes, which renews, Purges and cleanses all that is contrary to Nature, which it wonderfully expels and thrusts out by the Wound. It is made in this manner. Crab's-Eyes are dissolved in Essence or Spirit of Wine for a Month in *Balneo Mariae*. Afterwards they must be distilled in an open fire Sixteen times, always pouring back what is distilled upon the faces. Last of all, the essence of the Wine is drawn 6 times from the Oyl in *Balneo Mariae*, by cohobation, then you have an *Arcanum*, 1 Scruple whereof with a Drachm of Treacle, and a few Ounces of Punitory water, given Morning and Evening, performs what is said and more.

Crato.

3. Oyl of Cloves makes Wounds, that if it be put in presently, their pain immediately ceases without Inflammation, and it brings fordid Ulcers to a Cicatrice, and cleanses them; it stops Blood, nothing more.

J. Per. Faber.

4. For healing of Wounds use this Balfame; Take of the Decoction of *Arisolechia rotunda* in White Wine 1 Pound, common Oyl, red Oyl of *St. John's-wort* 1 Pound, Venice Turpentine half a Pound, juice of Comfrey root 6 Pounds. Mix them, and boyl them, to a consumption of the Decoction and Juice, till they be of a consistence of a Balfame, wherewith if you anoint Wounds, you will bring them to a Cicatrice in a short time. ¶ *Crocus Martis* is very effectual to stop Blood, especially that which is made of red hot Steel quenched in Vinegar, till it turn into rust, or a red Powder; which Powder digested in Vinegar, till the Vinegar be coloured, and then the Vinegar evaporated, it leaves a soft substance in the bottom of the Alembick; this Liquor mixt with Bean-flower or Bole-Armenick, makes an effectual Plaster to stop Blood. ¶ The *Terra mortua* or *Caput mortuum* of Vitriol quickly stops all Hemorrhages internal and external, externally it is mixt with the whites of Eggs, internally half a Drachm of it is given with Juice of Sowre Pomegranate, or of Lemons.

Gailh. Fabri-
cius.

5. I make a most excellent Balfame only of Turpentine and Gum *Elemi*, the Preparation whereof is of small trouble, but is of most excellent use in Wounds after their Suppuration and Digestion, in Ulcers and Fistulae after their Mundification; Namely, I take Oyl of Turpentine, which comes over a glass retort in a strong fire, of a red colour, I take of this 3 Ounces, pure Gum *Elemi* half an Ounce. I mix them in a Frying-pan upon a gentle fire, till the Gum be dissolved, then I strain it and keep it for use.

5. This is a most excellent Medicine to heal the Wounds of Nervous Parts; a description whereof I had from a Spanish Priest, who well deserved Credit; Take old Oyl 4 Ounces, Turpentine 6 Ounces, whole Wheat 1 Ounce and an half, *St. John's-wort* 2 Ounces, Roots of *Carduus Benedictus*, Valerian each 1 Ounce, Frankincense powdered 2 Ounces; let

the Roots and Herbs be bruised grossly, and infused in White wine for 3 days, when the Infusion is made, add the Oyl and Wheat, and boyl them to the consumption of the Wine. Then having made a strong Expression, add the Turpentine and Frankincense, and let them boyl a little. It is kept in a Glass. It cures Wounds, as they say, in 24 hours Hier. Fabricius. time, if the Wound be first washt with Whitewine, and then anointed with this warm.

7. This *Emplastrum glutinans Galeni* is a most precious and admirable Plaster, which I use with exceeding good success; if not the first day, at least on the second, Take dry Pitch half a pound, yellow Wax 6 pounds and 8 ounces, Pine resin 5 pounds and 4 ounces, Asphaltum or Bitumen Judaicum 4 pounds, and let this be chosen of the best. ¶ There grow some follicles in Elms near the leaves, full of a Liquor, like Honey, I never saw any thing better for healing of Wounds; certainly I have seen wonders from this Liquor; it may be kept and is of use in Gouty Defluxions, especially when it is rancid. This Oyl is gathered in the Month of May, and a glass bottle being filled with it, and stoppt with Wax and a Cloth, we make a hole in the Ground, about a foot deep, and put in the bottom of the hole a little common Salt, and set the bottle upon it, which we cover all over with Earth, after 20 days it is taken out, and this Juice is kept for the Gout and healing of Wounds. Fallopius.

8. This cures all Wounds, to a Miracle; Take of *Aqua Vita* thrice distilled, and well rectified 2 pounds, *St. John's-wort*, Hyssop, Millefoil, each 2 handfuls, Frankincense, Myrrhe powdered, each 3 ounces. Infuse them for 4 days, and distill them in *Balneo*, or in Sand. Keep it. When you have closed the Wound, wet it with this Water, by pouring it upon the Wound, and laying on Pledgits, wet in it, with Powder of Myrrhe, Mastiche, Frankincense, *Sarcocolla*, Bole-Armenick, Dragon's Blood each equal parts. Make a Powder; and strew it upon the future wet with water, and apply upon that a Pledgit wet in oyl of Turpentine, and bind it, do not unbind it till the fourth day, and once every day foment the Wound as it is bound, and wet it with the same *Aqua Vita*: On the fourth day loose the Ligature, and you will find the Wound healed; but if you should not find the Wound healed, do the same again, and open it not for 3 days, wet the Wound every day, as before, then loose it, and cure it as before for 2 days.

9. An Astringent Balfam is made of Tartar, if upon Tartar, calcined to whiteness, Spirit of Wine be poured, which must be distilled with a strong fire, and poured back again, till the Spirit be sweet. This Spirit is a Specifick Medicine, which heals Grembs. Wounds.

10. This is admirable for Suppuration, Take of Marrow of a Stag, fat of a Calf, Arsenick, fresh Butter made of Cows Milk, the best Honey, Oyl of Roses, Myrrhe each 1 ounce, the Myrrhe must be mixt with the Honey, and boyled gently on the Coals, after which the rest must be added, and carefully mixt. Hafensaffer.

11. The Bleeding of an Artery could not be stoppt in a certain man by any common Medicines, a little *Magisterium Opii* was applied to the wounded Artery, and the violent bleeding stoppt to a Miracle; the Wound was closed with *Emplastrum Stipticum Crollii* afterwards, and healed. Horstius.

12. Take of Venice Turpentine half a pound, Gum *Elemi* 4 ounces, oyl of *St. John's-wort* 3 ounces, bole Armenick, and Dragon's Blood each 1 ounce, *Aqua Vita* 2 ounces; Melt them on a gentle fire. Mix them. Add of Powder of Florentine Orrice, Aloes, Mastich, Myrrhe, each 1 drachm. Mix them. Make a Balfame. This is of excellent virtue in agglutination of simple Wounds; therefore when it is poured in, some *Emplastrum diachalcit* dissolved in oyl of Roses and Vinegar must be applied over it. Paracelsus.

13. This

13. This is a most excellent vulnerary Potion, Take of Periwinkle, red Mother-wort each one handful, boyl them in stale Beer, half away. Strain it, and keep it in a glasse well stoppt. Let the wounded Man take of this in the Morning fasting, at Noon, and when he goes to Bed, 3 spoonfulls at one time. The Wound may be washed with this Decoction, and a red Cabbage leaf may be wet in it and applied to the Wound, with the rough side towards the Wound, which must be bound fast on.

Ranzovius.

14. This is one of the best Medicines, that I know, which we may most safely use for Hæmorrhages of the Membranes of the Brain; Take of Frankincense 1 part, Aloes 1 part and an half. Mix them: when you would use them, mix them with the white of an Egg, till they be as thick as Honey, then mix some of the softest Hare's down with it, and so store of it is applied to the Vesel or to all the Sore, and then it is bound up. ¶ Some reckon the Down upon the inner shell of Chestnuts in Powder, as a secret.

Eust. Rhodius.

15. The Crum of wheaten Bread steeped in hot water is effectual to stop pain. ¶ For a Palsy from Wounds, this Balsamick Liquor of Mesue's is excellent, wherewith the Neck, all the Spina dorſi, and also the Part affected must be anointed; it is good for all Diseases of the Nerves, the Palpitation of the Heart, and it is admirable good for all manifest weariness beyond all imagination, and no better Medicine can be found, where the Heart wants refection, according to Mesue. And this is it; Take of Myrrhe, Aloe Hepatica, Spikenard, Dragon's Blood, Frankincense, Mummy, Opobalsamum, Bdellium, Carpopalsamum, Ammoniac, Sartocolla, Saffron, Mastich, Gum Arabick, liquid Styrax each 2 drachms, Laudanum, Castor, each 2 drachms and an half, Musk half a drachm, the best Turpentine, what is sufficient. Mix the Powders with the Turpentine, Distill them by Alembick, keep the Water. Some Cowslips may be added to make it the stronger.

Tagaultius.

16. This has been tried in many; Wash the Wound morning and evening in Wine; then apply a little Cotton dipt in Oyl of St. John's-wort to the Wound; it will heal with this only remedy without any further trouble.

Rolandus.

Vulnera Scopetorum, or Gun-shot Wounds.

The Contents.

Whether they be poisoned? I.

No Empyreuma remains. II.

Common Digestives are not proper. III.

In a Wound that goes quite through, a Seton must not be used. IV.

The cutting off a Limb must not be urged, because of a great Fracture. V.

Cold and very Astringent things must not be applied presently. VI.

The Expulsion of the Bullet must sometimes be committed to Nature. VII.

It must always be taken out, when it is near a joynt. VIII.

Which is the best Instrument for taking out a Bullet? IX.

Tearing the flesh must be avoided in taking of it out. X.

Nothing extraneous must be left in. XI.

Too much dilatation of the Wound must be avoided. XII.

When extraneous things must of necessity be taken out? XIII.

Hæmorrhage must be avoided in the Extraction. XIV.

When splinters of Bones must presently be taken out? XV.

When a Wound must be dilated, to get out what is extraneous? XVI.

What Medicines are proper? XVII.

Their Bleeding must not presently be stoppt. XVIII.

When Repellents are proper? XIX.

Whether Oxycrate be good? XX.

Whether hot things may be applied? XXI.

Whether hot Oyls be of use? XXII.

At the first visit, what must be taken notice of in the Wound? XXIII.

Whether Blood may be let? XXIV.

Blood must be let, sparingly. XXV.

Whether Purging be proper? XXVI.

Whether Butter may be added to Digestives? XXVII.

How long we must insist upon Digestives? XXVIII.

They must be liquid. XXIX.

What such the Tents should be? XXX.

In a Wound with Fracture, what such the swathing ought to be? XXXI.

How a supervening Hæmorrhagy may be stoppt? XXXII.

In a wounded Head, when Section must be made? XXXIII.

When the Skull is to be laid bare? XXXIV.

If Trepanning be necessary, we must not defer it. XXXV.

There must be a right use of Cephalick Powders. XXXVI.

In a Fracture of the Skull, with what caution Bones must be taken out? XXXVII.

A Fracture in the Skull sometimes curable without Section. XXXVIII.

When a Fever may hinder Trepanning? XXXIX.

In a great Fracture of the Skull, where the Skin is whole, we must be very careful in cutting. XL.

The Trepan must be dexterously used. XLI.

In Wounds of the lowest Belly with what caution we must Purge? XLII.

If the Bullet have not hurt some of the Viscera in the lowest Belly, it must not be too much searched. XLIII.

If it cannot be easily found, it must be left in. XLIV.

I. There be three opinions about Gun-shot wounds. Some hold they are poisoned.

Others deny, that they are poisoned, yet hold, they have an Empyreuma. Others will grant neither but all that these wounds differ in, which are made with a bullet, from other wounds, that are made with a sharp weapon, is in the contusion and dilaceration. But if there were any poison, it must come from the Gun-powder, or from the Bullet: It comes not from the Powder, because the Ingredients whereof Gun-powder is made, are not poisonous, Sulphur, Nitre, and Char-coal, are none of them poisonous; Yea Experience testifies, that abundance, who have been so wounded with Bullets, have had no Symptome, which was any sign of Poyson: It could not come from a leaden Bullet: For it is evident that Lead, especially whole, carries no poyson in it, because many carry Bullets along time in their Body without any harm: Which, though sometimes they may be be poisoned, yet it is not so in all wounds.

Sennertus.

II. Nor is there any Burning, for first of all the Bullets would be fiery hot and melted, which are taken whole out of the Wounds. Secondly, The Burning would be perceived especially in the things that are most combustible, as in the wounded Parties Clothes. Thirdly, The Wadding of Paper or Tow, when it is put in instead of a Bullet, is discharged without any marks of burning, coloured only a little black. Fourthly, Wounded Persons feel no heat or burning, only pain from Contusion and Dilaceration, in which the Nature of these Wounds consists. But the thing that has deceived them all, is this, that other Symptoms happen in these Wounds, and require another Cure, than Wounds made by Arrows. But they ought to have taken notice, that there is a great difference between these Wounds: For Arrows are sharp and wound by cutting, but Bullets are round, and hurt by contusion: wherefore a corruption of the contused Part, and bad Symptomes may easily follow.

Idem.

III. Although what is contused must be changed into Pus, and separated from the sound Parts, yet since the contused Parts do easily putrefie, and that there is danger of a Gangrene, the common Digestives and Suppuraters, which are used in other Swellings and Wounds, are not proper here alone, especially

especially if Nervous Parts be contused, which cannot endure such moist, and simply oleous and fat things, and require drying things; but such things must be used, as indeed help to change the contused flesh into Pus, yet cause not Putrefaction, and are also Anodyne. *Quercetan*, to avoid the inconveniences which attend the use of common Suppurators and Digestives, adds Mercury precipitate: But here great care must be had, nor do I think ought may be done rashly, for where Putrefaction is present, and a Gangrene is just imminent, I do not dissuade the mixing of Mercury, yet it is not necessary in every one, nor always safe; since Experience testifies that many such Wounds are cured without mixing Mercury, and there are safer Medicines, to hinder Putrefaction. And if Nervous places be wounded, the Precipitate may easily cause great Pain.

Sennertus & Plazzonus.

IV. It is the Custome with some, if a Bullet have struck through a part, so as the Wound be open on each side, to apply their Medicines by a Seton, and when they dress the Wound, they draw it this way and that, anointing it with a new Medicine: But seeing by this means, the passage of the Pus is stoppt, and pain is caused, it is evident the use of Setons is not safe, since the same thing may be done by putting in tents on each side; and Wounds, which are open but at one end, are cured without the help of them: Yet the Tents must not be too thick, lest they stop up the passage of the Pus and cause pain.

Idem.

V. These Wounds especially are rendred very difficult of cure, if Bones in the Arms, &c. be broken, yea, they are often broken into many shivers, in which, when the Nervous Parts are often hurt, and and prickt by the fragments of the Bones, thence most acute Pains, Convulsions and Gangrene arise. Which if it happen, vulgar Surgeons frequently hasten to Amputation of the whole Limb. But though sometimes, to make provision for the safety of the whole, this must be done, yet as long as there remains any the least hope of Cure, it must not be done: For Nature in these Wounds uses to do miracles.

Sennertus.

VI. I cannot sufficiently condemn their opinion, who advise cold and very repressing things presently to be applied to Gun-shot Wounds, which are complicated with Ambustion; for they strike back, and do not draw out the fiery heat, but fix it more in the Parts, and encrease the Disease, and Vinegar especially, which the vulgar commonly uses.

Quercetanus.

VII. In all wounded Persons this must perpetually be observed, that, if a Bullet be found to be there, it be taken out with some Instrument accommodate to that use, and that, as much as may be, without trouble or pain to the Patient: For if there be imminent danger of Pain, or of other accidents, or if the Bullet lyeso, as that it cannot be found, as it often happens, it is best to leave the expulsion of it to Nature her self; for then we must by no means extract the Bullet violently, because cruel Symptomes are raised by such Extraction. For I have several times observed, a Bullet has been lodged without any trouble, nor has it hindered health, but has tarried some years in the wounded Part, without any harm to the Patient.

Plazzonus de Vulner. Sclopet.

VIII. But if a Bullet be found near a Joynt or in it, then, because by compressing a Nervous or Articular Body, it causes great pain, it must of necessity be extracted out of the Body.

IX. There are many Instruments for the extraction of Bullets. *Hildanus Cent. 1. Obs. 88.* describes the aptest. And he renders the common one in form of a Wimble much more fit, hindring the Bullet from turning and slipping.

Sennertus.

X. When we have got a fit Instrument, that is, in respect to the Wound and to the form and figure of the Bullet, we must have a care that the Lips

of the wound, and the Flesh within be not hurt or taken hold on: for if this be done, it will create the Patient great trouble, grievous pains, and high Inflammations are raised. Therefore to avoid these things, we must never dilate or open the instrument till we first feel the Bullet with the end of it, for then we must open it, and take the Bullet out dextrously.

XI. When the Bullet is taken out, we must search the bottom of the wound with a probe, that, if by chance any thing extraneous be perceived to lie there, it may be removed. And this, as I said, must be done the first visit, if possible, for then, because the wound is fresh, less pain is felt, there is no Inflammation as yet, but the wound is warm, and not at all altered. But when a day or two is over, the wound swells, and all the adjoining parts are inflamed and altered, and so they close up the Bullet: Then the place, where it lies, is difficultly found, and though it be found, yet the Bullet cannot be got out without exceeding difficulty to the Patient.

Idem.

XII. Unskillful Surgeons usually commit an error in searching for and taking out extraneous things, and in handling the parts cruelly, immediately enlarging the wound with their Instruments, and fingers, (without any consideration had of the part, and of the habit of the whole body) in searching, moving, rending, pricking, cutting, bruising, and squeezing, whereby Inflammations are often raised, veins broken, violent Pains and divers other Symptomes caused, which are often so urgent, that they force a man to neglect in a manner the principal disease, and to turn his cure to them, which would not happen in most, if they were handled aright, or but left to the benefit of Nature. We reckon therefore, that every wound should not be amputated, nor all extraneous things be taken out, nor should the wound be opened at the other end, as some foolishly do.

Botallus de Vulner. Sclopet.

XIII. We think that such extraneous things coming from without must be taken out presently, as may greatly endanger the Patient: In like manner such as may be taken out without any great loss or pain. We must expect it will be very dangerous, when the Bullet presses upon some nerve, and puts the Patient to grievous pain. Or if it be about the region of any of the *ventres*, that is, the Head, Breast or lower Belly, and we fear it will afterwards penetrate into the Part, and this (if it can conveniently) may better be done at the beginning of the cure, than deferred longer: I say so, especially in regard of the Bullet, because through its weight it varies its site, so that afterwards it cannot conveniently be found.

Idem.

¶ When the Bullet cannot be found, or when there is danger in the extracting of it, the affair must be committed to Nature, if it be a leaden one; for if the Bullet be of Iron or Brass, there is danger, that the wound will not heal, because of the Rust. But if the Bullet stick in some noble Part, or in one which may draw a noble Part into consent, and if the Wound endanger the Patient's life, the Surgeon must not attempt the extraction of it, because by this means he can do no good, but only hasten a Man's end, which the Wound it self would in time procure.

Sennertus.

XIV. Yet we must have a care, while we are intent upon the work of Extraction, that a great flux of Blood do not come, whereby the Patients lose their strength, which often happens in an Empiricks hands: Therefore we must first endeavour to stop the Blood.

Botallus uti supra.

XV. But if there be a Fracture of the Bones, and any splinters of them be denudated of the *Periosteum*, which cannot be taken out without much pain, they must be taken out; otherwise they must be left in: for Nature will afterwards facilitate these, and greater pieces also, if there be any, for their exit, and

Idem. and the Bullet at length, because of its weight, will sink into some cutaneous Part, whence it may afterwards be taken without any harm.

XVI. It is very rare, that a Wound must be dilated to take out the Bullet, but sometimes we are forced to do it, that we may get out broken bones, which are sometimes too great, to come out at the external Ulcer. Sometimes also, when the Wound is in the Head, and any injury is suspected in the Skull or in the internal parts: Sometimes, when the Bullet runs along only under the skin, whereby the skin in that place would perish: Also when a Bullet is perceived to be in the Breast, or in the lower Belly, which cannot get out because of the narrowness of the wound: And sometimes we are forced to make way for it, on the other side, that we may get it out that way.

Idem. XVII. According as there are different opinions of the Nature of Gun-shot wounds, so divers sorts of Medicines are applied to these Wounds. Some without any discrimination, at the first Application apply only the white of an Egg, as if these were simple wounds. Others mix the white of an Egg and Vinegar. Others mix fair Water and Vinegar. Others add also some astringent Medicine, and Bole Armenick, Powder of Corall, Dragon's Blood, the three Sanders. Others add Turpentine and the oyl thereof. Some apply Treacle and Mithridate. Others, at the very first strew caustick and very hot Powders upon the wound, and apply common oyl, oyl of St. John's-wort, oyl of Elder, and other hot oyls. Some apply a Caustick, eating Medicines. Others run a hot Iron into the wound, and do it several times. But whether in the beginning either the white of an Egg alone, or Astringents mixt with it, be a proper Medicine we may easily judge, when we must take the beginning of the cure from Poyson, (whether Gun-shot Wounds be poysoned, See §. I. of this Title) because life is greatly in danger. And these Medicines have an astringent faculty, and the white of an Egg especially, of repelling and drying: Hereby the humors are condensed, the skin made imperiparable, the Poysonous quality is driven to the inner parts. Moreover, all such Medicines hinder the exhalation of bad vapors; whereupon cruel Symptoms, with great torment to the Patient, and hazard of his life, arise.

Plazzonus.

And according to their Opinion, that think these Wounds are not poysoned, there is danger in applying Repellents, because they hinder the due digestion and maturation of these wounds, that have a Contusion joyned with them, which requires changing into Pus. But what such the Digestives should be, see the preceding Title of Wounds.

Idem.

XVIII. And though these Men argue, that such Medicines stop bleeding, hot Intemperature, and other Symptoms of this kind; yet I answer, that it is very rare, for any great effusion of Blood to follow these wounds; and though sometimes it do follow, yet it must not presently be stopt: For when the wound bleeds much, it first prevents Inflammation usually, and, which is more, it may evacuate virulent ichores. Therefore a prudent Surgeon should in the beginning abstain from the application of Coolers, which otherwise through his ignorance and mistake do much harm, and put the Patient in further danger of his Life.

XIX. Repellents are proper, when we would keep back humors from falling upon any part. Which we ought to do, when the coming of an Inflammation is feared, or when one is begun or encreased. For upon this account we apply repellents to all Wounds, Contusions and Fractures at the very first, if it can be done: for by these means much humors are kept from flowing into the part affected. We use them for the first three dayes, or at most (if an Inflammation be not ur-

gent) four: But if the Patient be well set (as we say) and of a good complexion, two days will be sufficient. For when Coolers are either too strong or longer used than they should, the Ulcer grows crude and ill conditioned. Wherefore I have often been angry with ignorant and obstinate Surgeons, some of whom, would insist 7, others 14 dayes upon Repellents, which was often attended with the worst event. It is sufficient to use them only till the Concoction of the wound appear. But Repellents must be now and then repeated, not as the unskilful Gang do, who infuse Tow or Lint in Oxyerate, or Oxyrrhodinum, mixt with whites of Eggs, and such stuff, and apply it, and do not remove it all the day: which grows presently hot and tough, and then it does not repell, but hinders transpiration, whence many troublesome Symptoms arise.

Botallus?
cap. 8.

XX. Yet their opinion is not so much to be blamed, though not altogether to be embraced, who rather chuse Spring-water mixt with Vinegar, and mix that with other things, whose opinion is confirmed by Celsus his Authority, Lib. 5. *fac. Medic. Cap. 26.* who says, that cold water, and a little warm, is good for wounds. And they say Vinegar is proper, because it resists Putrefaction: hence it is that corruptible things are preserved in Vinegar from putrefaction and corruption.

Idem.

XXI. In like manner Turpentine, its Oyl, and Treacle do very much heat of themselves, therefore they are not so convenient in the beginning, unless they be mixt with other Medicines.

XXII. But as for application of hot Oyls, I cannot much condemn the opinion, as I cannot theirs neither, who apply actual fire; for the poyson which is in the wounds, is brought out by the virtue of fire. Nor need we question the possibility of actual Fire's resisting a poysonous quality by heat, for in Virtue and Power they are extreme contrary one to another, the fire attracts the poyson, because every like draws its like. Besides, the hurt part is strengthened by virtue of the fire. A Caustick also does the same, which is much commended by some. Yet I must ingenuously confess, that in these wounds in the beginning of the cure I never used hot Oyls or Fire, nor would I persuade any Man to use such kind of Medicines, because the Patients are afflicted and cruelly pained with the application of them. For in this way of cure I have seen most intense Pains, and violent Inflammations, great flux of humors, and other bitter Symptoms arise. And I use to reject these Medicines, because they do little good, and constant Practice and Experience has taught me better, which I use with great success and benefit to my Patients: For they are such as do not at all draw the humors, yet gently repell them, nor cause any Inflammation, but rather resist the poysonous quality in the beginning, and avert the power of the poyson, and its communication, from the Heart and other principal Parts.

XXIII. At the first visit these two things especially are immediately to be considered by the Physician, and upon these two all his Pains must be spent, that is, the poysonous quality and conflux of the humors. Nor let any man object, that in the beginning regard should be had to burning, contusion, attrition of the part and the bleeding. For I answer, that this Wound is not simple but complicate, and therefore we must first fall upon that, which is most urgent. And therefore we must begin the cure with poyson, wherein consists the greatest danger of losing life, the fluxion must be stopt, and other things which may increase Putrefaction, infect the Spirits, and cause other Symptoms; and in the second place, we must look after Pain, Inflammation and Bleeding. Therefore the poysonous quality must be resisted immediately. Now all Authors agree, that in every wound, where there is suspi-

cion

cion of poyson, attractive Medicines must be used immediately at the beginning, and things that evacuate by the part affected: Therefore we ought either to scarify the wound, or apply cupping-glasses, or do both together. But I commonly with good success always cut the Wound, open the part a little, and make incision, that the Blood may run out, and the poyson may be dissipated together with the Blood, and this dilatation or opening of the wound is very necessary, both that extraneous bodies may easily be got out, and also, that the *Sanies* and superfluous Humours, which breed in bodies affected with these wounds, may be conveniently purged, and also the cavities and *Sinus's* of these parts may be prevented, which otherwise usually happens through the unskilfulness of Surgeons: Besides, I clip away some part of the torn flesh, which operations indeed I use instead of Sacrification: Then also I apply a cupping-glass to the part, if there be one at hand, to take away the poysonous quality: and when these things are done I presently apply some things to the wound, that I may prevent the poysonous quality and flux of Humours, and if at any time there be an *Hæmorrhage*, I take some Yolks of Eggs with a little of the White; for the White alone applied does a great deal of harm, but when it is mixt in a small quantity with other things, it loses that astringent and emplastick faculty, to which I add oyl of Turpentine, *St Johns wort*, *Euphorbianum*, oyl of unripe Roses, adding a little *Terra Sigillata*, oriental bole Armenian, *Scordium*, powder of Tormentil root, and Myrrhe; for these things are violent resistors of poyson and putrefaction, as also *Galbanum*, *Bellium*, &c. draws out the poyson, in which Medicines Tents and Pledgits are dipt.

Idem, Ca. 19.

XXIV. After we have provided for the wounded part, we must then take care of the whole Body, And in this case we ought to breathe a Vein; for this is the best Remedy of all universals. For though Bleeding may seem not at all convenient in Gun-shot wounds, which have a poysonous quality joyned with them, because thereby the said quality is drawn into the inner parts of the body, and therefore to the principal parts with great peril of life: For in applying Cupping-glasses and Scarifications to the wounded part, the intention is not only to evacuate the virulence by the part affected, but by revulsion to attract it, that it penetrate not deep, or infect the principal parts. Bleeding by opening of a vein is altogether contrary to this intention; for it does not evacuate or expell the poysonous quality, but rather gathers and draws from the part and circumference to the centre. Yet I answer, that when it is said, A Vein must not be opened in poysoned wounds, this must be understood of Poyson from the whole substance, and not of a poysonous vapour. Besides, a poyson from the whole substance quickly creeps to the heart, and other principal parts, but an halitious poyson is not so soon communicated to the principal parts. We have an example in the bite of a mad dog, because sometimes many days and months pass, before a *hydrophobia* comes; so in Gun-shot wounds the Poyson is not communicated presently, and much less when Blood is let quickly; for Blood-letting is very good in Gun-shot wounds for revulsion sake; and draws no virulence inward, because in the beginning the venomous quality & poysonous Vapor is not so penetrating of it self, unless it be so attenuated by the heat and spirits, as to infect the heart, & come to the principal parts, especially when its passage is hindered by scarification and application of drawing Medicines. Wherefore always in these wounds as well as in others, Blood must be let by opening a Vein, to prevent a defluxion of Humours, and especially of bad juices; after which, if the wound be inflamed, bad Symptoms usually happen, as great pains, *Erysipelas*,

Grangrene, especially if there be a Catarrhmic in the Body.

XXV. Yet Blood must be let on this condition, that, when topical Medicines are applied, a vein may be opened, for so it may do good, but never harm. But large Bleeding cannot be approved of, and herein the greatness of the wound must not be so much regarded, as the plenitude of the Body, a gentle purge, or Clyster being premised.

XXVI. The next day, and the second visit, before the wound be looked on, the body must be cleansed, and to this purpose we must prescribe some gentle Medicine, but not a strong purge, because in a poysonous quality, which comes from without, violent purging is not so well approved of by Physicians. *Galen 4. m. m.* affirms that purging is not only proper in plenitude, but especially in abundance of bad juices, and in a great Disease. Therefore in these wounds it is very proper to give some gentle Medicine. Which is approved of also by *Hippocrates 1. de vulner.* For Purging by the Belly, is good for most wounds, because bilious, thin and serous Humours are purged; for such Humours might easily flow to the wounded part, and cause Inflammation, Pain, &c.

XXVII. Some put Butter in their Digestive Medicines in the beginning, yet I ever abstained from the use of it: for it greatly corrupts, putrefies and relaxes the part, but here we must always prevent putrefaction and corruption.

XXVIII. Some prefix the seventh day as a set bound for Digestives: Others go beyond this time, tarrying for the separation of the putrid flesh, that encompasses the Lips of the wound, unless what has been already suppured, be removed by abstersives. But I think the set term of leaving off a digestive Medicine, is, when we see the wound is concocted. Thus, you cannot (as some blockheaded wound-mongers do) prefix either the seventh or any other day certain.

XXIX. We must observe in the application of these Medicines that these digestives must rather be liquid, so as they may reach to the bottom of the wound: For Tents dipt in these Medicines must be applied, that the whole passage of the wound may be kept open, and that Medicines may be carried all over it.

XXX. Because ignorant Artists frequently commit Errors, to the no small damage of their Patients, they must be cautioned, that the Tents be neither too thick, nor too long, too hard nor too sharp. Long ones prick, thick ones extend, and also hinder the foul steem or any other putrilage from getting out of the wound. Hence Gangrenes of the parts, affected, heat of the liver, & swellings, which for the most part use to follow putrid wounds, and hence come fevers which will scarce go off again. Let them therefore be made limber, smooth, small, of soft and fine Lint or Cotton, or some such matter, that they may not cause pain. Which things must especially be observed, if there be a fracture of the bones.

Botallus, c. 16.

XXXI. A simple Fracture without a wound will admit of all kinds of swathing, but the case is far otherwise, where it is with a wound, especially one made with a shot, which requires a particular way of binding. For in a simple fracture we only look on it after the seventh day, and then bind it up, but in a Fracture with a wound, we must of necessity every day look upon the broken and wounded Limb, and take care of the wound, that the *Sanies* may be wiped off, and the poyson got out. For in a Fracture with a wound this is the chief contra-indication that hinders the healing of it, and protracts the cure a long time, because upon account of the Fracture it is necessary to keep the hurt Limb immoveable for several days, that the Bones may be well knit, which since rest does best perform, no doubt but it is of necessity required.

But

But upon account of the Wound we are forced frequently and before the time to apply local Medicines, for this end, that the purulent matter and excrements bred in the wound may be got out. The Ancients and the Moderns propound various wayes of binding in a Fracture with a Wound, who do all mean well indeed as to this intention, but they do not satisfie it; And therefore as the ways proposed by them do not please me, so I am very well satisfied with those ways which are observed every day in Practice, and very often experienced by me, to my credit, and to the benefit of my Patients. The chiefest therefore, and most approved ways are two, by benefit whereof broken Bones are kept in their place, and the wounds may be loosed. The one is performed by Swathes or Rowlers; the other with Plates or Splints, which are made of flexible matter.

The first way is best, when there is great Inflammation: The other, when, besides the Inflammation there is danger of great Pain. Wherefore, if we be called to a Patient in the beginning, who is ill of a Fracture and Wound made with a Shot, because as yet there is no singular Inflammation of the Part, after the Bones are set, and the Wound is taken care of with proper Medicines, the Fracture, Wound, and the whole Limb that is hurt, must be bound, that is, in such a manner, as that we may look upon the Wound every day, and take off the rowler, without moving the broken Bones. Therefore not only one single rowler must be taken, but several about an Ell long, and three Inches broad: for several rowlers are necessary, because not only the Fracture and Wound must be bound, but the broken Limb also must be bound for the space of 8 inches, 4 on each side of the Fracture. Ten therefore or Eight of these Rowlers must be taken: Ten, that is, if the Thigh be broken, and we place all these in order upon a broad piece of Cloth, so as one is placed half the breadth over another, and so we rowl one after another, that is the head of the first contrary to the head of the next, that is in this order, your Servant must hold one head tight, and the Surgeon the other, as strait as it is necessary to bind the fractured Part; and then we bind on another, and it must be straitened as much as the Patient can bear. But this must be taken notice of, that when we begin to rowl over, we cease pulling of the Rowlers, for so, whenever we would dress the Wound, we take off the Rowlers the contrary way, and bind it again, without moving the hurt Limb. Which excellent and safe way of binding differs from what *Fallopian* propounds; for he takes *Splenia*, and rowls the Limb obliquely round with them, yet the Part is bound unevenly. But we apply these Rowlers, not in an oblique manner, but circular and direct: for this way the broken Limb is bound equally and without any trouble. And if the Limb be not quite shot through, we may also make a case (or *capsula*) and yet it will be sooner and safer healed.

But because sometimes in shots it happens, the Bone is so broken, that the whole Limb almost is torn, so that upon account of the pain and greatness of the Wound, these Rowlers, and this way of rowling cannot be used in the beginning, then we go to another Instrument, which we use instead of Ligature; that is, we take a Plate of Brass, or of other tough and flexible matter, yet firm, of which a hollow Instrument is made, like a Pipe, made into the form of the broken Limb, that it may encompass the whole Limb that is hurt: it is armed on the inside with Cotton, for a Cushion, and we place the broken Limb conveniently in it, and bind it fast, that it may not be moved. But before this Plate be applied to the part, it is necessary, that we first fit it, and make a broad hole in that part, where the Wound is, that we may conveniently keep the Flesh and the Limb immoveable

upon account of the Fracture: For by this way, and by this Instrument, the broken Bones are not stirred at all, but are rather kept in their places; and the Wound may be dressed every day; and although the Wound go quite through the Limb, yet the Plate may have a hole made in it on the other side, so that all Wounds may conveniently be cured, without any molestation of the Patient; or hurting of the Fracture. For several in their Practice have with great success and felicity used this Instrument in curing Gun-shot wounds with fracture of the Bones. Plazzonus.

XXXII. A supervening Hæmorrhagy is stopt with Obstruents, Astringents, Revellents, cutting off the bleeding Vein. If the broken Vein appear, it is safest to close it with a hot Iron. If it lye deep in, fill the Wound with this Medicine; Take of Bole Armenick 4 drachms, Mastich, Frankincense, Aloes each 1 drachm. Mix them all with the white of an Egg. If by these things you cannot obtain your desire, have recourse to red hot Instruments. For you will obtain your end quicker, safer, and with less hurt than with Caustick Medicines, which create much pain for many hours; after which sometimes, the stopt flux comes anew, to stop which, the red hot Iron has not so much virtue after caustick Medicines are applied, as before the use of them, because the crust made by them is no small impediment to it. But to do the work with a red hot Iron, requires a Man skilled in Anatomy, who knows well the Site and Position of the Veins. Botallius. c. 15. (See BOOK VIII. Hæmorrhagia.)

XXXIII. When a Wound is made in the Head by a Shot, the Wound arises not only by way of Puncture, but also by way of Casure and Contusion: for the Bullet pierces by Contusion, and it dissolves and tears the natural union of the Parts, whereby the *Cranium* is chiefly affected, especially if armed with a Helmet. Therefore a Wound in the Head, and Contusion both, will either be in the external Parts only, as in the skin and *Pericranium*, or with hurt of the Bone, and of the internal Parts also. If the skin only be wounded, and the *Pericranium* with the skin, let the Wound be cured, as wounds in a fleshy part. Yet this must be observed, if in the Wound we see the *Pericranium* is much hurt and swelled, the Wound must immediately be dilated, making incision in the *Pericranium*, and separating it from the Skull. For by this means it never putrefies, nor does matter gather upon the Skull, and the Wound is sooner healed. But if there be only a Contusion in the skin without a Wound, then apply to a whole skin something that has a virtue to dissolve, digest, exsiccate, strengthen, and ease Pain. Plazzonus.

XXXIV. We must observe this perpetually, if we perceive the Bone is hurt, or laid bare, or if we fear the inner Parts are hurt, presently the Skull must be laid bare, the hurt skin must be cut, and it must be divided from the *Pericranium* and the Skull. For the skin does easily heal, though it be cut off needlessly, as *Celsus* says, *Lib. 8. Cap. 4.* For we must totally make bare the Skull, that we may scrape it, and perforate it, or when there is a fracture, take it out, if there be occasion. Idem.

XXXV. When we must trepan the Skull, all delay is dangerous. Therefore we must not trepan it only the first, second, third, or fourth day, whether to raise, or to take out a Bone, but the seventh, eighth, ninth, tenth or eleventh, or any of the following dayes, if the case require it: For we need not here (as the unskilful do) fear any critical dayes. Critical dayes must be observed in Wounds only for the Prognostick not for the cure. Indeed in Fevers, and other Diseases, which Nature her self alone oftentimes uses to overcome, they must be observed both for Prognostick and Cure: But in this case no salubrious work can be expected from Nature. For she never trepans, nor raises

Botallus.

what is deprest and sticks (except in young Children.)

XXXVI. Although drying Medicines be commended in every wound, newly made either by puncture or caesure; yet that place of *Galen 6. Meth. in fine* (who prescribes things they call Cephalicks presently, and to the end, of Illyrian Orrice, flower of bitter Vetch, *Manna*, *Aristolochia*, bark of Allheal Root, and things that exerge without biting) has misled many. For what else do the ignorant common sort of Surgeons, bolstering themselves up with this opinion, but clog the wound with this powder? What Nature, I pray, is so strong, as to be able to endure so inept using of any Medicine? I do not say indeed, that the Medicine is pernicious in its own Nature, but because it is ignorantly used; for being so applied it dries more than it should, yea it wastes the very flesh, and sometimes heats the Brain beyond measure; so that I have seen some people dy, I suppose rather for such a cause than for any harm received in the internal parts from the weapon when no noxious Symptome in them had gone before, and they were better every day than other for the first seven or eleven dayes, while they committed themselves to country Barbers, without the excessive use of Cephalicks (as these wonder-working Surgeons use to boast) But leaving off the first, and other people being called, who put too high a Value upon this Cephalick powder, and other Medicines, they call Capital, quickly more grievous Symptomes followed, which killed the Patient. I would often open the heads of such bodies, that it might be known, whether there were any latent injury from any wound, namely, whether there were clotted Blood, or an inward Fracture, or any such thing, in whom nothing was found, besides Pus gathered under the Membrane, made of the proper substance of the Brain corrupted: Which did certainly show, that the Remedies were more to be blamed than the greatness of the wound, when it was manifest the Patients were observant of orders.

Idem.

XXXVII. *Galen* sayes well in the place before quoted; "Those Bones, *saieth he*, which are violently broken, whether they be severed from the sound, or be yet after a sort conjoynd, must alwayes be removed: Especially if such be with the wound of the Skin. We make this distinction, because we do not allow that Bones may be taken out in every fracture of the Skull or external Ulcer: Nor must all they, that are with a wound (as *Galen* sayes) be followed to the very end of the fracture, as some foolish Surgeons do, who that they may come to the utmost end of every fracture make an exceeding large, and a more mortal wound in the carnos part, now I call it a carnos part, whatever is contained on the outside of the Cranium.

Idem.

XXXVIII. Contusions of the Cranium are some of them with fracture, others without fracture, and some of these with a Wound of the Skin, others without. But when the Contusion or Fracture are without a Wound, indeed the Surgeons business is doubtful, namely, Whether he should divide the Skin, and lay open the Bone, or insift rather upon dissolution and exsiccation without section? Though this be an arduous question, some may think it trivial, and presently decide it for Cutting for the reasons following, namely, because contused Wounds putrefy, because Blood gathered in the place of Contusion and extravasated (it is called an *εγκύμαμα*) it also is corrupted, and because many other mischiefs usually follow: To say nothing here of the Pain from extension, and the mischief arising from the compression of the contused Bone. But the Reasons which maintain the contrary opinion are not enervous, namely, Because those contusions and fractures of Bones are more dangerous, difficult of cure, and of longer continuance which are with Wounds, than those (if

there be otherwise a parity of cases) which are without. Wherefore *Galen* speaks most skilfully *comm. 3. de fract. textu 43.* where he sayes; "You must know, that all things which are under skin, delight much in skin, and that nothing which is under it, can be denudated of it without damage. But what wonder, if those things which have a proper and connate covering from the skin, be alwayes delighted with it, and be indisposed and troubled at all other things? Wherefore I have often observed, when I have not cut off part of the Skin, but have laid on a gain that which was separated, it has grown together again, and which is more admirable, when immediately after the blow the place has been black. Whence we gather that the Skin must not alwayes be opened, when it is not wholly divided, for the reasons alledged by *Galen*. Which I have sometimes confirmed by experience. And that Bones, little or nothing made bare of their proper covering, do sooner heal or set, ordinary Practice proves, for experience shewes that many, at least some, fractures without a Wound, wherein many pieces of Bones are perceived to be separated from the main Bone, are sooner cured, than a small contusion or fracture of the Bone with a Wound or tearing of the Skin. For in a fracture without a Wound, the Bones not altered by the Air or Pus, do easily knit, if Inflammation can be hindered by Art. But in the other we must tarry for exfoliation of the firm Bone, which also is not made till after many Months, and especially if they be hard and great. But in the Head, because they are thin, they scarce pass the second Month, without natural detersion or exfoliation.

Idem.

XXXIX. Whether does all manner of Fever hinder the Trepanning of the Skull? *Hippocrates l. c. n. 28.* "Wherefore when you understand that a Fever invades a Man, and from several other signs, that it is coming upon him, we must make no delay, but either perforate the Skull to the Membrane, or scrape it with a *scalprum*. Which text is not unworthy of some discourse, nor must it be past over without distinction. Certainly I have seen some cured, who were wounded in their head, with a hurt in their Skull, and taken with a Fever, whom I would not suffer to be Trepanned. For every Fever does not perswade Trepanning, but only that which is caused by the Wound. But here lies the difficulty to distinguish the one Fever from the other. Now the Fever which comes from a Wound, though usually it have the greater Fits every third day (which is common with all other Cholerick Fevers) yet it has these things, as it were specifick, namely uncertain chiness, both as to duration, magnitude, and time of coming, which comes most violently and ofteneft upon the critical dayes of the Wound; besides the Fever fit followes the cold on the critical day and uncertain sweats come, without any benefit. But yet it has this thing more especial, that it rarely tinges the Urine, but it appears well concocted, in its perfect colour, as the Patient used to have it. We may add some other things which follow, to wit, some trepidation in the Nerves, especially in the Wrist, drowziness, heaviness of Eyes, difficulty in looking on the Light, or other things before enumerated. And these are the things which *Hippocrates* means by other Signs. Wherefore we must not say, There is a Fever, therefore we must Trepan; or, There is a Fever, therefore we must not Trepan; But, A Fever is caused by the Wound, therefore the Skull must be Trepanned: Or also, though there be no Fever, but some other potent Symptomes, it must be Trepanned, if the strength be good, lest you go about the work on the day of death and so discredit the Remedy to no purpose. Therefore the sooner you do it, so much indeed the better.

Idem.

XL. I must needs take notice of this, a thing wherein sometimes I have seen the ignorant offend, namely in section of the Skin, where the Fracture of the bone is great, in which Fragments of bones are wholly moveable and severed one from another. Which often happens in them that are Wounded with the blow of a great stick, or some such weapon, or by a violent fall, in the *bregma* especially, and in young men above all. Here, I say, in opening the Skin, too heavy a hand forces the Incision knife into the Brain by the *hiatus* of the Fragments, wherefore here we must act with the greatest care possible.

Idem.

XLI. Great care must be taken in the use of the Trepan, for the circle must be searched with a Probe or with a blunt Elevatory, for oftentimes the Skull will be quite cut through on one side, the second Table on the other side almost remaining entire; which comes to pass either through the Artist's fault who perhaps holds not the Trepan to a perpendicular, or because the Skull is not in all places alike thick. When therefore the skull is in some place wholly divided, and in the rest of the circuit cut so thin, that it may be broken with an Elevatory, the Trepan must be laid aside. And if any blood come from within, before you have taken out the Orbicular bone (as it often does) it will not be amiss to let the bone alone for some days, according to Hippocrates his advice. For in a perforated bone, left after perforation, no mischief can follow, for what is left is made thin. And the reason is this, that the brain may not suffer from a Tegument, that is new, and aliene from its nature, so that it is safer to go from one extreme by little and little to the other, especially when any blood comes after perforation, whereby perhaps the brain will not be a little relieved, unless it come from the membrane, wounded by the Artist. Such an operation must be performed with a most attent mind in tender age, because of the thinness and tenderness of the skull.

Idem.

XLII. In wounds made by shot in the belly, after blood-letting, &c. purge the body, especially if it be full of bad juices, carrying off such humors, as you shall find predominant; But we must take great care, the Physick do not vomit, especially when the wound is in any of the *ventres*. For it fills the Head and Breast, and vexes all the parts with its violent motion, and sometimes pains them.

Idem.

XLIII. If the Bullet have passed through the *Epigastrium* on each side, without hurting the Liver, Spleen, Stomach, Guts, Bladder, or any of the great Veins or Arteries, which it has been my fortune sometime to see (And I know, it so happened some years ago, to the Generous Captain Jannavelt in Piedmont, who lives well in health among us this year 1681. who, when he had fought a whole day, received a shot in the middle of his Abdomen, without any of his Bowels being hurt.) I think the wound should not be enlarged, for it will do no good, but rather harm. Because the greater the orifice is, the more will the Bowels be burnt by the external Air. But if any of the parts aforesaid be wounded, the dilating the orifice of the wound in the *Epigastrium* will do no good, seeing there is no hope of a Cure.

Idem.

XLIV. But if the Bullet remain within, and you have no certain sign, that any of the said parts are hurt, you must endeavour to get it out, the

Patient lying upon his wound, and turning himself this way and that, yet so as that the orifice of the wound may look directly to the ground: Then the experienced Artist must search for it, and bring it out with a bended Probe. But if it cannot be found, and if the wound be in a part, which may suffer dilatation without much danger, it must be opened length-way of the muscles, till it will admit a man's fore-finger. And the Instrument for dilatation must not be sharp pointed, lest the Guts should be pricked; when you perceive the Bullet, you must endeavour to get it out by Art, but if you cannot well do it let it alone. Certainly I have seen some shot in the Belly who have lived after, with the Bullet, which it may be, had fallen out otherwise if we had been forced to seek it and take it out. Among which there is an Armour-Smith now alive, who was shot a little above the right Groin, and the Bullet lodged, but could not be got out, or so much as be found; yet I would not suffer the wound to be enlarged. Therefore it must rather be left within than make a Section, that is either dangerous, or but with little hopes of obtaining one's desired end.

Idem.

Medicines especially made use of by eminent Physicians.

1. A noble Bezoardick Plaster; Take of Wax 1 pound, Turpentine half a pound, dried Toad half an ounce, *Bdellium* 2 ounces and an half, white frankincense half an ounce, white Amber one ounce and an half, Serpent's Skin dried N^o. 1. Figs N^o. 8. incorporate and mix them all according to Art. In the end add prepared Magnet 1 drachm, *liquor Arsenicalis* 2 ounces, Spirit of Salt half an ounce; Boyl them all, keeping them continually stirring, then pour to them Oyl of Scorpions, 1 ounce and an half. Mix them. Make a Plaster. It is very good in gun-shot Wounds.

Joh. Agricola.

2. This is an approved Medicine in a deep wound made by a Shot. Take of Bay-berries, root of *Aristolochia rotunda* each one drachm, Crabs dried in an oven 1 drachm and an half, dried Burnet half an ounce. Make a powder; which must be boyled in 3 pounds of Wine to a third. Let the Patient drink 1 ounce every day, and foment the wound with it, or inject it into the wound.

Platerus.

3. This drives out all poyson from a poysoned burnt wound by a shot, as I have often tried, and though it be an ordinary Medicine, yet it may be reckoned a great secret; Take of Swallow-wort 1 ounce, Valerian, Tormentil, each half an ounce, Polypody 2 ounces, Garden Angelica 4 ounces, wild Angelica, Marsh-mallow each two ounces, nettle 1 ounce and an half, root of *Thymelaea* 1 ounce and an half, root of Scabious, Valerian, each half an ounce. Let them be all gathered between the fifteenth of August and the eighth of September, which must then be cut and put in a glazed pot well stoppt, with a sufficient quantity of vinegar, and so let them stand 12 hours. Then let them boyl an hour and an half. Then pour off the Vinegar, and when they are dried and beaten to powder, add, 12 berries of the herb *Paris* and 36 leaves. Make a Powder, the dose is 1 drachm in white wine.

Quercetanus.

A GUIDE TO The Practical Physician.

BOOK XIX.

Concerning Remedies borrow'd from Diet, Surgery and Pharmacy.

Acidulæ, or Mineral Waters.

The Contents.

- They cure contrary Distempers. I.
Not to be drunk rashly. II.
Whether the necessary quantity should be drunk together at one draught. III.
In what quantity they are to be drunk. IV.
The greatest dose is not to be taken in the beginning. V.
Whether when one is come to the highest Dose, he must keep to it. VI.
The necessary quantity to be drunk in as little time as may be. VII.
How many dayes they are to be drunk. VIII.
Whether to be drunk cold or hot. IX.
How to be emptied when they will not pass of themselves. X.
Whether the smoking Tabaco help their passage. XI.
Lying in Bed furthers their passage. XII.
Riding is better than Foot-exercise. XIII.
We must Purge once in eight or ten dayes. XIV.
How one may know when to Dine. XV.
Sleep at Noon is to be avoided. XVI.
The Waters are not to be drunk in the Evening. XVII.
Whether Women should desist upon their Terms flowing. XVIII.
Whether leanness alwayes prohibit their use. XIX.
Divers cautions in their use. XX.
Whether artificial Acidulæ can be prepared. XXI.
Whether Victuals may be boyled in them. XXII.
Of what parts Acidulæ consist, what Waters are understood by that name, and of their vertue in general. XXIII.

I. **S**prings being endowed with the faculties of both hot and cold Minerals, must needs cure both hot and cold Distempers, in the same and in divers Bodies. And seeing it is the property of heat to rarefie, incide and attenuate; and of cold to condense, astringe and incrassate; 'tis no wonder that these waters produce contrary effects, namely (for in-

stance) both procure the Terms in Women; and also stop their immoderate flowing. For these Waters are an Empirical Medicine, and the same thing happens to them as to Treacle, which seeing it is compounded without reason, and receives into it many things that are superfluous and repugnant to one another, comes to cure various and those contrary Distempers. Heet, cap. 9i & 13.

II. A poor Country-Fellow being a long time troubled with Bleeding at the Nose and with the *fluxus hepaticus*, drank the Mineral waters disorderly, observing neither hour nor season: yea in the very drinking of them, whilst others use Anniseeds or Lozenges to warm their Stomachs, he eat raw Apples, laughing at those that advis'd him better: But before a Month went about, one of his Legs gangren'd, so that he was glad to have it cut off; and within a Month more the like Gangrene seiz'd upon the Arm of the other side, about which whilst consultation was had whether it should be cut off also, the poor Man died miserably. Heet, Disf. 29.

III. Whether should the necessary quantity be drunk all together, or be divided into several Doses? This latter way is the safer: for 1. being drunk at one draught, the Stomach is so loaden with it that it vomits it up: or 2. if it should be kept, its weight would make it pass through so quickly, that its vertue could not be put into act, nor it self be distributed into the Body: and 3. seeing they are drunk actually cold, they would offend the Stomach by their coldness. Sebil. p. 346.

IV. No Nation seems to drink Mineral waters more freely than the Italian, for Fallopius prescribes them to 120 ounces. The Germans are more sparing, for Andernacus will not have the largest Dose to be above twenty seven ounces. Though we cannot appoint a certain measure, which may be as a Standard; yet we think it profitable to express in some latitude the least, middle and greatest Dose: For people that are grown up let the least Dose be eight or twelve ounces, the middle thirty two, the highest, sixty four. And that a convenient quantity

tity may be prescribed, we must consider the circumstances, as, the Disease, the Temperament, Strength, Age and Sex of the Patient, the climate, time of year, manner of life, custom, habit of Body, parts affected, and the like. Of which, the greatness and vehemence of the Distemper is the *Indicant* properly so called; the strength of the Patient is the *Permittent* or *Prohibent*; the other circumstances are the signs of the weakness or vigour of this: But the most certain rule for the quantity is the Euphory or well-bearing, when the Stomach dispenses well with it. But daily experience shews, that those that drink the *Spaw*-waters but in small quantity, receive but small benefit by them, yea are often prejudic'd: whereas those that drink them plentifully, are cur'd of great Distempers by them: so that *Frambesius* says rightly, that the more one drinks, the more good he receives, if so be they pass well: Therefore let every one consider his Stomach, how much Water he can bear, and how soon he passes it; and let this be his rule, *That the best Indication is taken from Hurters and Helpers.*

p. 114.

Sebis, p. 516.

Claudin. de Ing. Scit. 1.

Heer p. 119.

Sebis, p. 509.

V. Authors advise to ascend by degrees to the highest Dose, that the Stomach may be inured by little and little to the Waters as being actually cold, and also that it may be understood how the Patient will be upon the drinking of them, for a mans peculiar temper does not presently appear. But we here admonish again, that respect is not to be had so much to the number of cups, as to the Euphory or well-bearing of the Patient, and that the measure is to be accommodated to every ones nature.

VI. When one is once come to the highest Dose, some advise to keep to it till the end: But because experience teaches that the diseased can seldom hold to the greatest Dose for four or five dayes, but that they fall into Vomiting, Fainting, or difficulty of Breath; it is more adviseable to follow the counsel of *Herodotus* in *Oribasius*, viz. to descend by degrees till one come again to the first and least quantity.

VII. *Ryetus* admonishes prudently, to drink that quantity which a Man prescribes to himself, in as little a time as may be, that is, to make an end of it in half an hour: for otherwise, seeing these waters pass quickly, it would come to pass that the first should pass before the last be drunk: which although *Fallopins* allow, yet 'tis generally disliked, because by this means the last would be evacuated more slowly to the great prejudice of the drinkers; and this is proved by daily experience, and as many as have been often at the *Spaw*, will subscribe to the truth of it.

VIII. Some prescribe a certain number of dayes: others have regard to the colour and consistence of the evacuated water, which if for two dayes together it be such as before it was drunk, they then think 'tis time to abstain: We think they are to be drunk so long as the Patients bear them well, without confining them to a certain number of dayes; and that they are also to be drunk so long as seems necessary for the perfect cure, or at least for the bettering or manifest change of the diseased. But as for the two first opinions we can subscribe to neither; for as for the first, it is impossible to prescribe a certain number of dayes because of the diversity of Diseases and Morbifick causes; and as to the second, it cannot be a certain rule, seeing the Waters are used not only in Diseases with matter, for Humours contained in the Veins, but in Diseases without matter, for altering and strengthening.

IX. Some will have them warmed, lest they offend the Stomach and Bowels with their coldness: but experience teaches that many thousands drink your *Acidulæ* cold without any prejudice. Yea they ought not to be heated, because thereby they be-

come white, frothy, turbid, and some of them red, whence is intimated a loss of their virtue by evocation of their Spirits, which also happens to other Liquors, as Wine, &c. 2. being drunk lukewarm they loose the tone of the Stomach and are vomited up. Yet lest by their coldness they should offend an empty Stomach, being taken out of the Well let them be held a little in ones hand in a closed Vessel, that by that means they may lose somewhat of their coldness; and let them be swallowed leisurely, that as they descend into the Stomach, they may be a little warmed by the parts they pass through, viz. the Mouth and Gullet.

Idem, p. 583.

X. If the Waters altogether stagnate or abide in the Body, as it happens to some, what is to be done? Answer, there are divers receptacles of the Water in such cases: If therefore they stay in the Intestines, which is known by rumbling of the Belly, by belching, by tension and weight of the abdomen, then on the same day inject a Clyster of the same water with an ounce or two of *hiera picra*, or of *hiera Logadii* or also of *hiera diacolocynthidis*, and so you shall bring the water all away: But if this succeed not, then try a sharper Clyster, and the day following administer some purger of the Phlegm that has hindered the passage of the Waters, and do this for two or three dayes together if it be necessary, omitting in the mean time the use of the Waters. But if the Water be retained in the Veins, which is known by the absence of belching, and of rumbling and swelling of the Belly, let the Body be purged the next day (for the absence of pain presses not for a Clyster on that day) with Pills of *hiera* with *agarick*, or with *Pil. Aloëphangine* being taken to three scruples and an half, and afterwards procure sweating: If these Pills bring not away the Water, *Fallopins* advises to add a grain or two of *Elaterium* to one Dose of the said Pills. Yea *Fallopins* was wont, for the making of the Mineral Waters pass, to give something of *Elaterium* first, and after that the Water, with very good success.

Heer, p. 149.

XI. The English upon drinking the Waters presently smoke a pipe of *Tabaco*, which I do not disallow; but it would do better if by holding their Breath they kept the smoke longer in their Mouth, and did not so quickly puff it out: For none can doubt, but the fiery smoke of *Tabaco*, when there is no other passage granted it, by descending into the Stomach must heat the Waters, and so hasten the pissing or exit of them.

Idem, p. 130.

XII. I have seen some go to bed about two hours after they have drunk the Waters, covering themselves warm, and thereby to have procured a very quick passage for them: yea very many have found this means more available than any other exercise.

Idem, p. 121.

XIII. After drinking the Water the Body is to be exercised some way, or one must return home, which it will be better to do on Horse-back or in a Coach than on Foot, as certain experience teaches. For besides that such as travel on Foot, are apt to sweat, and so the Serum being diverted another way will flow more sparingly by Urine; sitting upon an Horse or in a Coach compresses the Muscles of the Belly and the Intestines, yea and the Stomach it self, and agitates the Body more strongly, whence the Waters being sooner heated are readier pisset out, as will be most clear to any one that shall try it.

Idem, p. 122.

XIV. He that will provide well for his Health, must take a Purge once in eight, ten or twelve dayes, drinking no water for that day: for thus the waters will pass more freely, and the whole puddle of Humours being washt away, the Body will be left most sound: Let Physicians therefore give this direction to their Patients.

Idem, p. 100.

XV.

XV. *Socrates* said, that the hour for rich men to dine is when they will, and for the poor when they have wherewith: Here we must dine when all or the greatest part of the water is emptied either into the Close-stool or Chamber-pot. But because some, especially on the first days, evacuate but little, or it may be but half the water, that they may not hurt themselves by deferring dinner too long, let them take this for a sign when they may conveniently dine: If any one upon drinking the waters make some white Urine, as all use to do, and after, that which is coloured, let him dine securely, for it is certain that the remainder of the water that is contained in his Body, is retained for some other use by Nature which is the dispenser of what is taken: or however when for about two hours he has ceased to piss, or to go to stool, if the water work that way, he need not fear but he may dine safely. Let him sup when his Appetite or his reason judges that his dinner is concocted.

Idem. p. 150.

XVI. There is nothing worse for those that drink the waters than sleeping at Noon, for it hinders their Operation, (seeing it dulls their nature, whose office it is, after a good digestion is made, to expell superfluities) and also shuts up the humours that ought to be thrown out of the Body, in some part where they putresce. Besides, this sleep ought rather to be ascribed to mineral vapors than to Nature, so that it dulls the head, heats the body, and hence causes fluxions. Moreover seeing it is short, and therefore presently ceases to promote the concoction of the Stomach, when they are awaked, the meat comes to float through the Belly; and the bile, which is wont to be moved outward at that time, is revoked inward by this sleep, where being collected it may cause a Fever, or if it stay long, be excocted into a Melancholick juice. Lastly there must needs be caused by this sleep contrary motions of the juices in the Body, viz. by the day-light which calls them out, and by the sleep that recalls them inwards. But if any (as many of the *Italians*) have much used himself to Noon-sleep, because there is little or no passion from things that one is accustomed to, let him attribute something to his custom, and sitting upright in a Chair, but not lying along on a Bed, let him rather slumber than sleep.

Idem. p. 132.

XVII. Towards Evening before Supper many say that the Waters are to be drunk again, but only in half the quantity that was taken in the Morning: but I have seldom seen that drinking them at this time has done any one good: Therefore unless one have an extraordinary strong Stomach, let him drink little or none before Supper, unless perhaps it be to quench his thirst.

Idem. p. 133.

XVIII. It often happens that while Women are drinking the Waters, their Terms supervene, and yet they think they ought to persist: But we think they ought rather to forbear, 1. Because the waters provoke the Terms, whence there is fear that the flux should become immoderate and not to be stoppt, especially in those who have large Vessels and much and thin Blood: and 2. Because no necessity presses that two evacuations should be attempted at the same time, and your *acidulae* for the most part evacuate either by stool or Urine.

XIX. Although your *Acidulae* dry, yet there is no reason for the debarring of emaciated People from the use of them, for fear their Soul, which is seated in heat and moisture, should be expelled: for we have seen the driest persons and such as have seem'd to be almost without Blood (rather living Carcases than men) to become fleshy and in good plight by the use of these Waters: namely the obstruction of the Mesaraicks and Liver being removed and the Stomach strengthened, better chyle has been transmitted to the Veins, whereby they have been

replenished with good Blood, which soon filled the Muscles with flesh.

Heer, de acid Spadai p. 28. 66.

XX. They whose Stomach has wholly lost its oeconomy; They who cannot warm the Waters either by their natural heat or by such as is acquired by Medicines; They whose vital Parts are almost extinguish'd; who have a long time labour'd under shortness of Breath; whose Breast is distended with a dropie of the Lungs; who (if they be adult) cannot bear about eighty ounces of Water; let none such come to the *Spaw* waters, unless they would go worse away than they came, or be buried there. Such as come, having invoked God and consulted the Physician, having left cares at home, and with a serene mind being intent only upon their health, let them betimes in the Morning, but the Sun being first up, (when they have clear'd their Body of its excrements through all the passages) drink as much water as they can, so their Stomach be not oppress'd: let them evacuate by Urine or Stool what they have drunk: when they have evacuated the greatest part, let them dine: after dinner let them drive away sleep by play, walking, &c. let them sup sparingly: taking a short walk after Supper let them go betimes to Bed: and let them follow this course of Life, till the Physician shall advise them to depart.

Heer. Spadai p. 139.

XXI. Some Chymists promise a certain compendium of your *Acidulae*, and pretend that they can do as much by a certain salt powder given to a few grains, believing that the Stomach is offended by the great quantity of water, which a little powder cannot do. But this is a mistake; for this is the prerogative of mineral waters, that they do not offend the Stomach though taken in a large quantity; in the mean time they pass through all the Vessels, and whatsoever vitious matter they meet with, they wash and cleanse it away, which a few grains of any salt powder cannot do, if one consider the great number of Mesaraick Vessels, to which a few grains bear no proportion, so as that the salt should be distributed to them all: to say nothing of that singular mixture that is made by Nature, which Art cannot imitate; and that the virtue is not seated so much in any fixt salt as in a volatile Spirit, which easily vanishes. Nor must we rashly pass judgment of the qualities of these Waters: for if we see that they consist of (*v. g.*) Alum, Sulphur, Iron, Nitre, &c. we must not presently conclude, Therefore they have the same virtues with the Minerals they consist of. For according to *Hippocrates*, lib. de vet. medic. In Man (and other Mixts) there is bitter, salt, acid, inspid, which being mixt and temper'd are neither discerned nor offend: But when any one of these shall be separated and exist by it self, then it both becomes conspicuous and affects a Man, and so obtains another virtue of affecting. Hence gather that the qualities of Mineral Waters are to be enquired after by experience rather than by reason; and that they are an Empirical Medicine whereby divers and contrary Distempers are cured. See an example of artificial *Acidulae* in *Platerus's* Observations lib. 3. p. 610. where he sayes, that some mix Spirit of Vitriol with *Acidulae*, that they may acquire an acidity, but I have observed that that has prov'd prejudicial to many. *Willis* sayes that he can make Artificial as effectual and grateful as the Natural.

Sennertus, pract. l. 3. part. 5. sect. 1. cap. 6.

XXII. It is the opinion of some, that it is convenient to boil Victuals in Mineral Waters; but I do not approve of it, 1. because the use of Medicaments ought not to be continual, for by that means they become so familiar to Nature that they will effect little. 2. Nature is not perpetually to be tir'd with Medicines, but at Dinner and Supper time to be refresh'd with mere aliments, that she may endure the cure which is sometimes wont to last three, four or five Weeks. 3. Medicaments do infect aliments: and these on the other hand

R r r 2

dull

dull the vertue of those. 4. Mineral Waters do in no wise pass into the nourishment of the Body, and therefore if they should be detained too long by the Food, they would be corrupted, for through the thinness and purity of their substance, they are easily alter'd. 5. If Viduals should be boil'd in the Waters, it should either be for profit, but then they would have but little vertue; or for necessity, but if they be drank twice aday, they are taken in a quantity sufficient either for evacuation or alteration; or lastly for pleasure, but so by boiling they lose their grateful taste, &c.

Scab. p. 617.

XXIII. Your Mineral waters, commonly called *Acidulae*, for the most part are wont to spring from a mixture of the Spirit of Vitriol, sal Nitre and Alum (which Minerals are indeed sometimes found simple, but more often mixt more or less with other Minerals in the Bowels of the Earth, especially with Iron.) There is great plenty of these Springs in divers Countreys, in those especially that abound with Iron Mines: Germany alone affords near a thousand, as *Bernhard Varenius* affirms in his *Geograph. general.* cap. 17. lib. 1. But in Britain the more Famous are those of *Barnet, Epsom, Tunbridge, Astrep, Scarborough*, and that which springs out of *S. Vincent's Rock* near *Bristol*. And the excellent vertues of these *Acidulae* both in reducing the over-fervent Blood to a just temper, and also in cleansing it gently from Sulphureo-saline impurities both by Urine and Perspiration, yea, and in opening obstructions of the Bowels, are so well known not to Physicians only, but also to the unlearned multitude, that they need not be published by me. Nor need I stand in prescribing rules in the due use of them; for that is done by others. But I think good to intimate this in general, that the Dose is to be increas'd or lessen'd daily according to the quicker or slower passage of the Waters, observing a due regimen in the mean time both in Diet and Exercise: and that a longer or shorter time is to be spent in drinking the *Acidulae*, according to the greater or lesser Euphory and emolument of the drinker.

Charlton. de Scorb. p. 184.

Astringents.

The Contents.

The same are not convenient in all Cases. I. & III.
How Medicines made of Mars astringe. II.
Respect is to be had to the Parts and Humors. III.
We must take heed of binding too much. IV.
In Diseases of the Breasi we must astringe sparingly. V.
Whether there be astringent Clysters. VI.
In some Cases that require Astringition, Openers, &c. are of use. VII.
We must not rely much on *Crocus Martis* for astringition. VIII.
When *Tormentil* is to be preferred before *Bistort*. IX.

THE Universal and common Indicant for Astringition is the looseness of the solid Parts, chiefly, and next of the moist; or in particular, 1. The looseness of the *Parietes, Walls* or *Sides* of the Parts; hence Astringents are convenient in strengthening the Bowels when they are too loose, and hence they are called, and are, *Tonicks*: So Astringents also conduce to the moderating of the consistence of the Blood, and resisting of Putrefaction; whence many of them are also *Alexipharmacks*: For the essence of malignant Diseases, especially the Plague, seems to consist in the resolution of the Blood, when its consistence is so perverted, that it is not sufficient

for vital actions, but the Serum and Blood are parted: of which sort are both Acids, and mucilaginous precipitants, and also Balsamick diaphoreticks. 2. The rarity of the Pores. 3. The mobility of the humors. 4. The solution of the unity of the Membranes and Vessels. 5. The consequent eruption of the humors, sometimes of the Blood and Serum. Now astringents, that are owing to these Indicants, are of divers kinds, which although they all agree in uno tertio, and intend one and the same end, yet as *Galen* notes, 3. de sang. miss. c. 15. this or that Astringent Medicine, besides its astringition, has several other qualities, and therefore cannot obtain altogether the same effect; or, Different effects are observed to proceed from different Astringents: For that which astringes, besides astringition is either Acrimonious, or Fat, or Sweet, or Bitter, or Salt, or Acid; whereby is manifestly intimated what difference there is in the choice of Astringents for this or the other purpose. In general, Astringents are cold and dry; and, according to *Cartes*, their vertue consists in a certain thickness and figure of Parts, whereby they constringe the Parts of another Body like a wedge, or twine them like Fiddle-strings. Therefore the active principles, Salt, Sulphur and Mercury, are less vigorous in them, or at least are immersed in earthy Parts, and as it were fixed. And they are either 1. Earthy, drying and absorbing, which astringe with biting, as *bolus Arm.* Corals, *lapis hematites*, *terra sigillata*, Chalk, *crocus Martis*, &c. or 2. Sour and Austere, as *Bistort*, *Tormentil*, Alum, Vitriol, &c. which abound with an astringing austere Salt, either vegetable or metallick, with earthy Parts; or 3. Acid, as Vinegar, the spirit of Vitriol, Simple and Martial: of which we must note, first, that acid Astringents are more proper for fluxil Humors, both in the Vessels and out of them, which they coagulate as it were and fasten; but not so proper for the Pores and Parietes, whence they are convenient inwardly in Hemorrhagies, as suppos'd of the Nose; Thus we have cured Scorbutil Hemorrhagies with Spirit of Vitriol, in regard Acids do in this manner coagulate the fluid Blood: but Acids are not so convenient for the Pores or Parietes rather, for coming thither they incide, dilate, and exasperate the humors the more. Secondly, therefore we must not always rely on acid Astringents, for they do not so constringe the Pores as do austere, lowr, and other stypticks, but they are withal indued with a thinness of Parts: whence those that use to give Acids in dysenteries, diarrhoeas, spitting of Blood, and wheresoever the Pores of the Parts or the Membranes are affected as to their substance, can seldom boast of any good effect. Or 4. They are Emplastick, whether oleous, which obstruct the Pores, or gummos, mucilaginous, viscid, and emplastick properly so called, as Gum Arabick, *sanguis draconis*, Mastic and *Farina*, or Flowers. 5. Some also are sweet, as Chestnuts; some bitter, as Aloes, &c. Or 6. Balsamick withal, being endued with a Sulphur immersed in terrene Parts, whether implicitly, another quality predominating, whence Medicines properly called cold are also astringent, as galls, acacia, Pomegranate rinds, &c. or explicitly, as Aloes, (which used outwardly astringes) Myrrhe, Nutmeg, the rind of Frankinsence, Cinamon, which latter indeed are hot and joyned with Acrimony, yet through their manner of substance, (in regard it has both an Emplastick vertue and drying earthy Parts) they are astringent (so the caput mortuum from the distillation of Cinamon-water powerfully astringes) but they are commonly improperly called so; for they are either not used inwardly for astringing, as Aloes; or they benefit by strengthening the heat withal, and also confirming the Parietes, on which account Nutmeg stays vomiting. Or 7. They are Escharoticks, which do not properly astringe any more than the

the former, but inasmuch as they consume the flowing humor, and induce a Crust upon the Parts, they come to leave an astringent behind them, even as Fire is used to stop the hemorrhagies of the Vessels in the cutting off of Limbs; so Lime, Spirit of Vitriol and Vinegar have place in some cases. Or 8. they are *Ergents*, such as are Narcotics and Opiats.

II. Medicines made of *Mars* (Steel or Iron) are of a middle Nature, and are used both for opening and binding. But note, that such of them as are more vitriolated, and have the metallick Salt more explicit, open more; and such as are more terrene and changed into ochre, bind more.

III. Internal Astringents must be agreeable both to the Parts for which they are designed, and also to the humors and cause; for some are more proper than others: Thus *Aromatick* astringents are more agreeable to the Stomach, as Nutmeg, Treacle, &c. Which if they be not to be used alone, are at least to be mixed with others: For it is most true, that *Aromatick* astringents are better for the Stomach, and therefore for *diarrheas*, dysenteries, and vomitings. *Acids* also are more agreeable to the Stomach; for Vinegar is good for the Stomach both to foment it withal and to drink, unless there be some erosion in it or in the Intestines, yet even then *Acids* are good outwardly. In Diseases of the Lungs, *Resolvers* are to be mixt with them; of the Liver, penetrating *Acids*; of the Head, *Balsamicks*: So if the matter be too Fluxile and Acrimonious, Mucilaginous Astringents are more proper; if malignant, as in an Epidemick dysentery, Bezoardicks are to be added, or Astringents endued with that quality are to be chosen, as *Tormentil*, *Terra Lemnia*, &c. So if there be an acrimony of the humors, and a strong irritation of the membranous Parts, fixers are to be mixed with astringents; for in this Case both these being mixed together perform that more happily which one could expect from either of them alone: So, for example, Opiats do indeed stop *Diarrheas* and dysenteries, and Astringents left to themselves stop the same; but seeing Opiats do more fix the humors, and Astringents more defend the *Parietes* of the irritated Parts, hence *Laudanum Opiatum* mixt with a *Styptic Powder* is of greater efficacy because it attends both, and so fulfills the intention the more happily: Where the Parts are to be defended, the terrene profit more.

IV. We must never astringe too much, lest the Pores subside too much, and by that means can hardly be relaxed: Hence also in a Dysentery, for example, from the too great use of Astringents there often arises anxiety, dangerous Ulcers, &c. for Fluxes often require rather to be moderated than stoppt, and all things are to be done according to nature's direction; wherefore *Aromatick Resolvers*, or Openers are profitably mixed with Astringents.

V. In Diseases of the Breast in general we must astringe sparingly; both because the tone of the Lungs rejoices in laxity, and also because the viscid, hot or bilious Matter may easily be expelled to the heart because of its vicinity: hence they are not good in a *squeaking small voice*, straitness of the Breast, difficulty of Breathing and Asthma, Inflammation of the Lungs, or Pleurisy; For they incrassate the humors the more, fasten them in the Part, and make them unfit for expectoration, yea bring on a suffocation.

VI. There are no astringent Clysters properly so called, because all moisture injected into the straight gut, as being strange to it, irritates it, even water itself: yet they are called astringent, and those are prescribed which by a certain mucilage restore the mucus of the intestines that was fretted off, and are made of milk, Deer-suet, &c. such as

Minderus chiefly commends: yet even this way they dilute and temperate rather than astringe.

VII. In some Cases though the Flux cease, and so likewise the mobility and eruption of the humors; yet astringents are so far from benefiting, that they rather hurt; for instance, the immoderate flux of the Terms, especially in the hypochondriacal, is often caused from an obstruction of the Vessels, whereby the Blood cannot circulate freely, whence Nature being burthen'd seeks other ways for the passage of the Blood. In like manner when the same immoderate Flux is from plenty of Blood, there astringents profit not: There is an Inducant indeed for astringent, but this is the last thing, or the end; but he that will attain the end must also attend the means, and so in that case Aperiatives are rather proper. So also in Hydropick and cachectick Persons bleeding at the Nose is very frequent, in whom the Spleen or Liver are affected; in which case Medicines that strengthen the Bowels are requisite indeed, but the more chief intention is to open the Parts obstructed; and therefore let it be noted as a rule, When with an afflux of humors, there is present either an obstruction of the Vessels or a plenty of humors, astringents do less good, but rather in the first case Aperiatives, and in the latter Evacuators, as blood-letting.

VIII. As it is well known that *crocus Martis* is either aperitive, or astringent; so we must never perfectly rely on *crocus Martis astringens* alone: for first it is certain that these two differ not, save that in the Astringent a more earthy, absorbing and constringing quality predominates, and in the aperient a more saline vitriolate, which in the former is more changed and taken away by the most urgent Fire of the Reverberatory: Hence in case Acid, Austere or fowr humors excite Tumults and Fluxions in the Body, as is usual, or *Diarrheas* from an overloose Tone, by the accession of these humors in the Body, part of the *crocus* recombines as it were, and so loosens as much as it astringes. Whence where the villi of the viscera are to be strengthened, it profits much, inasmuch as it exerts its vertue in opening, as they call it, or in correcting the less fluxile humors; but where there is looseness with erosion, (for instance) we must deal warily with it: But the less vitriolate *crocus Martis* is, the less aperitive it is; and the less ochreous, the less astringent: whence we must not alike absolutely trust to *Mars* alone, to all oits, and always.

IX. The roots of Bistort (or Snakeweed) and Tormentil have a great affinity: but we must note, that seeing the Roots of this latter are of more thin Parts than those of Bistort, we must always prefer Tormentil where less astringent is required, as in the beginning of a malignant Dysentery: Moreover Tormentil is given with very great benefit in malignant Fevers, as the small-Pox, Measles, *Petechiae*, yea in the Plague, and Epidemick Dysentery, not because it moves Sweat, but that it may bridle the ebullition of the mass of blood: which is the reason also, why the Roots of Tormentil enter the composition of the *pulvis Pannonicus ruber*.

The Contents.

- The same are not every where alike profitable, and the reason of their difference. I.
 Of what kind Corroboratives should be (where it is discoursed of the harm of Sugar.) II.
 The frequent use of them is hurtful. III.
 They are to be accommodated to the tenour of the Stomach and Heart. IV.
 In what time of the Disease they are convenient. V.
 A new way of conveying Cordials to the Heart. VI.
 The efficacy of Cordials that are taken. VII.
 Let them not be earthy for such as are troubled with obstructions. VIII.
 Whether there be a Cordial vertue in Gold. IX.
 The right preparation of Antimonium diaphoreticum. X.
 Whether one may rely on Bezoar-stone. XI.
 In what quantity it is to be given. XII.
 Whether crude or calcin'd Harts-horn is to be used. XIII.
 It has various vertues according to its different preparations. XIV.
 The right preparation of it. XV.
 Whether there be such a thing as an Unicorns horn. XVI.
 The excellency of Treacle for prevention. XVII.
 It is not to be given to Children. XVIII.
 The dose of it. XIX.
 Whether there be a Cordial vertue in precious Stones and their magisteries. XX.
 The hurt of common magisteries. XXI.
 The hurt of magisterie of perles. XXII.
 For what people Tormentil and Bole are not convenient. XXIII.
 A caution in the use of the Salt of Vipers. XXIV.
 The various endowments of sulphureous, urinous, and acid Spirits. XXV.
 Let the Gellies of Hartshorn, Ivory, &c. be new. XXVI.

THose are reckoned for Cordials that assist the Heart labouring in any kind; wherefore one is every where said by Authors, notably to strengthen the Heart; another to keep it unhurt by any putrefaction; others to relieve a weak oppressed heart, to cure its tremor or fainting, and to preserve it from corruption. Moreover because in the Plague, small Pox, and malignant Fevers the Heart is believed to be seized or beset with Poyson or Malignity, therefore the remedies that are wont to help in those Diseases, are not called simply Cordials, but Alexeteries and Alexipharmacks. This opinion concerning both Cordial and Alexeterial Medicines, seems to rise from hence, inasmuch as the Heart is commonly believed to be the beginning of all Life and Heat, and that therefore our Health and Death depend on its immediate affection: hence what things soever recreate the Soul, they are supposed to do it as they are benign and friendly to the Heart. But seeing we have in another place shewn largely enough, that the subject of life is not the heart, but chiefly and almost only the Blood, and that the Soul it self (on whose existence and action in the Body life depends) is founded partly in the Blood and partly in the animal Spirits, it will plainly follow, that the remedies which preserve Life intire, or recruit it when it is in danger, respect these Parts of the Soul, (viz. the Blood and animal Spirits) rather and more immediately than the Heart.

Therefore that the Reasons and Manners of the Operation of those Medicines that are called Cordials may be known, we must consider these two things, 1. How many and what ways especially, the Blood, being amiss or in danger as to its accension, or its mixture, requires aid from Medicine, whereby it may be preserved or amended. 2. After what manner the Heart is hindered or perverted from its due motion (for it serves to drive the Blood about) through the defect or fault of the animal Regiment, and for which, Medicines that encrease or set to rights the Spirits, are indicated.

As to the first, the Blood in respect of its accension, either fails or exceeds, and in each respect different Medicines, namely hot or cold, or as it were Oil and Water, are required; and therefore they are commonly called Cordials, though they affect not the Heart at all: for though upon the taking of them the motion of the Heart is often changed, and accordingly the Pulse becomes presently frequenter or slower, stronger or weaker; yet this therefore comes to pass, because the motion of the Heart, depending altogether on the influx of the animal Spirits (by a wonderful consent and co-action betwixt each Portion of the Soul) is most exactly proportioned according to the accension of the Blood: Wherefore accordingly as the Blood doth intend or remit its effervescency or *astus* by the Medicines that are taken; presently the animal Spirits, that move the Heart, exactly obeying its condition, cause the Heart to beat more quickly or slowly; and also if the animal Spirits be affected by the same Medicine, the Pulse is likewise on that account rendred more or less strong or vehement, whilst in the mean time the vertue of that Medicine reaches no more to the Heart it self, than to the Hands or Feet, or any other Muscle. Therefore that the first rank of Cordials, whereby the Enormities of the Blood are cured, may be rightly ordered, it will be fitting to consider, how many and by what ways its liquor, both as to its accension and its *Crafs* or mixture, is wont to be perverted or depraved; and moreover what sort of Medicines, vulgarly reputed Cordials, are required for each of its disorders.

First therefore the Blood is sometimes not accended enough, nor circulated with vigour, as we may observe in many languishing People, namely, such as lie long Sick, or have suffer'd great Hemorrhagies or other immoderate Evacuations, or are worn out with old Age, who namely together with a weak Pulse and decayed Strength, have their extreme Parts for the most part cold and pale; the reason whereof is, because the Blood is become almost yappid and effete through the too great waiting and depression of the Sulphureous Particles; and therefore it is accended very sparingly in the Lungs: To which is often added, that the animal Regiment failing also, the Heart being destitute of a plentiful influx of Spirits, does not enough exagitate the Blood, that it may effervesce and be accended the more briskly. The Remedies to be used in this case are generous Wines, Strong or Burning Waters, or such as are more mild, distill'd with Spices (or *Aromata*) Aromatick Powders, Species and Confections, Chymical Oils and Spirits, Tinctures, Elixirs, and other things endued with sulphureous and spirituous Particles; to wit, such as may exagitate the Blood more, and make it more inflammable and turgid; and seeing the same do withal exsuscitate and comfort the animal Spirits, they therefore make the Heart beat more briskly and strongly.

Secondly, The Blood through its sulphureous Particles being too much loosed and driven into a fervor, is often too much accended, and disperses an over-intense and very troublesome heat through the whole Body: wherefore that it, being so much rarefied and flagrant, may be kept within the Vessels, and also eventilated, the Heart beating vehemently and quickly,

quickly, drives the Blood about with great labour and endeavour: Therefore in this case cold and attemperating Cordials are to be used, which may bridle and allay the fervour of the Blood, and also kindly recruit the animal Spirits, that they may now perform the more difficult tasks of life: For which ends the distilled Waters of Borage, &c. the juices of Sorrel, Citron, &c. are wont to be used, to which Opiats are often added with profit, for the *impetus* of the Heart being a little bridled, the Blood does more happily and sooner remit its effervescence.

But the Blood is not only depraved and perverted as to its too much or too little accension, but diversely also through its *Crisis* or mixture: Nor are Cordials presently requisite in all its Dyscrasies, but only in those which being excited in Fevers, seeing they are sudden and outrageous, threaten a total Corruption to the mass of Blood.

The Blood effervescing feverishly is in danger as to its *Crisis* two ways chiefly; namely, 1. Either the Band of the mixture is too strait, so that all the Particles are so complicated and combin'd with one another, that the Excrementitious cannot be extricated from the Profitable, and the thin from the thick, as it happens in some continual and putrid Fevers, which although they be but little or not at all Malignant, yet because they can have no *Crisis* either by Sweat or Perspiration, sometimes end in Death. Or, 2. The Blood in Fevers has its *Crisis* perverted the contrary way, namely, by a too great Laxity of its Particles, in which case Cordials of another sort, viz. Alexipharmacks, are required. For it often happens that its *Compages* is too much loosened and pulled asunder as to its *Crisis*, by heterogeneous Particles, either bred within it self, or pour'd into it from somewhere else, so that the common band of its mixture being dissolved, its Parts every where fall asunder; and then the Portions of the coagulated, extravasated or stagnating Blood being fixed here and there putrefie and are corrupted, and at length the whole mass is so much vitiated, that it is no longer fit for continuing the vital Flame, or for extilling the animal Spirits into the Brain: wherefore all the Functions must then needs flag by degrees, and life perish at last. The Cordials requisite in this case must consist of such Particles, as being conveyed into the Blood and circulated with it, persist still unconquered, but yet are withal benign; which while they enter into all the Pores and Passages of the mass of Blood, do everywhere exagitate the other malignant Particles, pull them from their Concretions, and at length either subdue them, or drive them forth: by which means the Blood being freed from its poisonous mixture, and withal from all its private Coagulations, and being again divided into its smallest and elementary Particles, recovers in short time its former salutiferous mixture. Moreover that it may appear more plainly in what manner Alexeteries preserve the Blood and Juices of our Body from (*effatus*, or) taints, or free them from corruption when they are already touched therewith, we must consider how other Liquors that are liable to Putrefaction are preserved, or when they are seiz'd upon thereby may be restored: Therefore concerning Beer we may observe, that being of its own nature soon apt to grow sour, it is made durable by boiling Hops in it: likewise that common Water, which otherwise would soon putrefie, continues a great while unalter'd by boiling, or infusing bitter Vegetables in it (of which sort there are also Alexipharmacks.) Moreover, that the juices of Herbs, and some other Liquors being already grown musty, if they be smoak'd by burning of Sulphur, recover their former vigour: Besides, that Wine, Beer, and other kinds of Drink being grown almost dead and good for nothing, do often revive by exciting a fermentation in them anew. The reason whereof

is, that seeing the corruption of any thing consists in the exsolution of the elementary Particles; and in their departing from one another, whatsoever detains them in motion and perfect mixture while they tend to flight and confusion, preserves that Concrete, so long, safe, and sound: Moreover if any thing do again bring together the Elements that were loos'd and going to depart from one another, and rouses them into a new fermentation, it drives Putrefaction from the Concrete, although already begun, and procures a firm concretion to it again. That such alterations and freeings from corruption can be performed on Liquors made by Art, every one knows: and indeed in the Plague and malignant Diseases Alexipharmacks seem to perform the same Effect: for these being taken often, inasmuch as they exagitate the Blood continually, and drive it into an higher ferment, notwithstanding the influence of the hurtful (*inasmata* or) impurities, they conserve its mixture intire: yea, after the malignity has made impression, and the *Crisis* of the Blood begins to be loosened and dissolved in the manner aforesaid, such Remedies being still exhibited for promoting Sweat or Perspiration; inasmuch as they decoct the impurities of the received taint, and induce a new fermentation opposite to the other corruptive one, they often deface the *Impetus* or impressions of the pestiferous Malady.

As to the Cordials by which the too strait *Compages* of the effervescing Blood is loosened, and opened for the setting at liberty the febrile Matter and other Recrements, those are of affinity with some Diureticks and Diaphoreticks, yea, sometimes they are of common or reciprocal use, inasmuch as the vitiated *Crisis* of the Blood sometimes cannot be relieved, unless its *Compages* being first unlocked there lie open an *exit* for discharging the Serum by the Reins or the Pores of the Skin. Saline Medicines do chiefly execute all these intentions of Cure; for, as we have elsewhere noted, the opening of any Body whether liquid or solid, is hardly performed but by a Saline key: For commonly all concretion or compaction is from a Salt of one sort, and the dissolution from some of another sort, that snatches into its embraces the first Salt: and then Precipitation is caused by some Salt of a different condition, that destroys the Combinations of the former. Therefore we reckon Salines among Cordials no less than among Diureticks and Diaphoreticks, because there is the same reason in all. In the first rank Cordials endued with a volatile Salt offer themselves, and are justly preferable to all other, as the Spirit of Hartshorn, of Blood, of *Sal armoniacum* compound, viz. distilled with Amber, Treacle, and other Alexeteries, the Spirit of Skulls digged out of Graves: Hither may be referred also the Salt of Vipers, the Powder of Toads closely calcin'd (which I have known famous and very profitable in an Epidemick Pestilential Fever.) Such Remedies as these have recalled many from the very jaws of Death, and indeed afford help often in a various and manifold respect; namely, first, inasmuch as encountering either a fixt or an acid Salt, and snatching them into their embraces, they open the mass of Blood, too much thickned and straitned by the febrile effervescence, and so promote the Separation and Secretion of the Morbifick Matter: And secondly, in that they relieve the animal Spirits, and rouse them up from their sluggishness to execute their Office: to which may be added, that in Malignant Fevers these Medicines subdue, and often extinguish the poisonous Particles of the Morbifick Matter. The Second place among *Saline Cordials* is of right owing to Remedies endued with an *alkalifate* or petrifying Salt; for these are commonly reputed very notable Cordials: Of this sort, namely, are the Bezoar Stone, Perles, Corals, the Bone of a Stag's heart, and the Horn of the same, the Powder of Ivory, the Eyes

and

and Claws of Crabs, and other Powders of Stones and Shells, which common Experience witnesseth to be often given with benefit: And the reason of their helping seems to consist in this, That the Particles of the Alkaline Salt in the Medicine, encounter the Particles of the acid Salt within our Bodies, and by and by do intimately cohere therewith, and therefore destroy the ragings or whatsoever other undue combinations thereof: To this *Classis* of Cordials are Bole-Armene, *terra Lemnia*, *Sigillata*, and other chalky Medicines deservedly reckoned; but not upon the account that they succour the labouring Heart (as is vulgarly thought) but because they destroy the Predominances of an acid, or fixed Salt, either in the Bowels, or in the mass of Blood, and by and by allay and correct the Enormities produced thereby. *Thirdly*, If I should exclude *Acetous Medicines*, or such as are endued with a fluid Salt, from this list of Cordials; every one almost would tax me; for these are esteemed by most to be notable Alexiteries against the Pestilence. Wherefore in the cure of Malignant Fevers Treacle, and Bezoartick Vinegars are highly cryed up; yea, Vinegar or Acetous things are usual Ingredients in Waters distill'd for that use: for the same reason Spirit of Vitriol, the juice of Citron, Sorrel, Pomegranats, &c. are reckoned for Cordials and Alexiteries, and that indeed justly, because these do excellently dissolve the Combinations of fixed Salt with adust Sulphur, and master their outrages; and therefore by such Remedies as these the Coagulations and Extravafations of the Blood, that use to happen in Malignant Fevers, are often prevented or cured. *Fourthly*, for the same Reasons for which the aforesaid Saline Medicines are reckoned for Cordials, others also whose basis is a fixt Salt, are reputed such, or are put into their Compositions: For seeing Salts of divers sorts are bred in our Body, and they commonly pass from one state to another, hence not one kind of Salt, but Salts of different kinds ought to be given according as the intention is. On what account Medicines endued with a fixt or lixivial Salt do take away or correct the Enormities of an acid Salt predominating within the Bowels or Blood, was shewn above. *Fifthly*, A Nitrous Salt is justly numbred among Cordials, as without whose Particles, to be inspired with the Air (in taking our breath) the life of Animals cannot subsist: but this being taken in at the Mouth (as a Medicine) is accounted a famous Antipyretick, in that it takes away Thirst and bridles the febrile Heat; which yet it does, not only by helping the mixture of the Blood, but also its accension: for we think, that Nitrous Particles, together with Sulphureous, are requisite to constitute a flame, and the more of the Nitrous there are, the clearer and brighter the flame is. Wherefore seeing a Matter, which for the greatest part consists of Sulphur with Salt and Earth mixed, being kindled sends forth but an obscure flame; and such as is vitiated with Smoke and Soot; but if Nitre be added, burns clear and calm with brightness: We think 'tis just thus in Fevers, when the Blood being filled with adust Feculencies smokes with a suffocating heat rather than burns out, Nitrous Particles being taken in at the Mouth and transmitted to the Blood, make it by and by to burn brighter and clearer; so that the *Compages* of the Liquor being unlocked, both its serous and fuliginous recrements part the freelier from it.

But moreover some Medicines have the name of Cordials, because they exert their virtue on the animal Spirits first, and more immediately than upon the Blood, and so erect, vigorate and compose either some Portion, or the whole subsistence of the sensitive Soul that was too contracted, depressed or otherwise disturbed. And indeed this kind of Remedies do in a sort affect the heart it self, although remotely; in that, seeing the whole sensi-

tive Soul is elevated, and expanded wider by giving of them, the Spirits also that are appointed for the *Præcordia*, flow the more plentifully into them and actuate them the more briskly: and therefore the Pulse that before was weak or faltering, by and by beats more strongly, and the Blood is driven about with the greater violence. This sort of Medicines are fitly enough reduced to two Heads, and as they are gentle or rugged, attain the same scope; namely, they either erect and confirm the animal Spirits by cherishing, and as it were gently and softly stroaking of them; or else by vexing and as it were spurring of them, they drive them into quicker and sometimes more regular Motions. The Cordials of the first sort, as soon as they are swallowed, nay, sometimes being but tasted, exert their Virtue, and by a grateful appulse recruit the Spirits that reside in the first ways; then by the continuity of these the same ovation being communicated successively to the other Spirits, shortly undulates through the whole *Compages* of the sensitive Soul; so that both the Brain, and also the *Præcordia* being irradiated with a fuller influx of the Spirits exulting as it were, they perform their Functions more briskly and cheerfully. For this purpose (taking heed of the too great incitation of the Blood) serve the Waters commonly called Cordial, also the Preparations of Mosch and Amber, and the Aromatick Powders that are mixt with them: Such things as have a grateful favour or smell, or are pleasant to look upon, inasmuch as they recreate the animal Spirits, are reckoned also among Cordials. In the mean time other Cordials of this *Classis*, the first ways and mass of Blood being almost untoucht, seem to operate first of all in the Brain, of which sort are some Cephalicks so called, which though they be less grateful to the Palate or Stomach, and hardly ferment or exagitate the Blood, yet illustrate the Brain, and exacuate and strengthen the Inhabitants thereof, the animal Spirits. Of this Nature seem to be Sage, Betony, Rosemary, Vervain, &c. There are another sort of Cordials, that operate in a different manner, and help wholly on another account; those namely do not gently cherish the animal Spirits, and cause them to be expanded equally, but rather irritate them, and make them run and be carried this way and that way: to the end namely, that they being inordinate before and unequally dispersed, crowding in some places, and thin in others, and therefore intermitting or perversely acting some offices of their Functions, especially within the Brain or *Præcordia*, may be disturbed and more agitated by an ungrateful Medicine; which in such a case is a very good Remedy, in that being thereby roused, as if they were lath'd, they leave their former disorders, and of their own accord return into regular order. Thus it is usual in swooning, fainting, oppression or spasm of the Heart, and in almost any other failings, languors or irregularities of the Spirits, to give inwardly Spirit of Hartshorn, of Soot, of Sal Armoniack, or Tincture of Castor or *Asa fatida* with other Liquors; or to hold to the Nose these, and the like, as especially volatile Salts and Emphyreumatical Chymical Oils: Besides it may be sometimes good in sudden Defections of the Soul to sprinkle cold water on the Face, to pinch the Nose, very much to shake the Body, and sometimes to strike a box on the Ear. Such Administrations as these give help, inasmuch as they rouse up the animal Spirits being oppressed, or distracted, or employed otherways than they should, and command them (being expanded, and mustered as it were) to their former usual Offices.

II. Seeing in almost all Diseases diminution of Strength, as being more urgent, draws to it self a curative Indication, and persuades that before all things roborating and comforting things should be given the Sick; 'tis no wonder that Physicians are often intigated to appoint such: But if you inquire of them

them what those comforting things are? they produce divers Blandiments of the Tongue, Confections and Aromatick Spirits, never regarding whether they be hurtful to the Patient or not: nor understanding that these things that please the Palate, are often prejudicial to the Stomach. For can these things be comforting that are administered while the forces of the Disease still survives? how shall the Citizen fortifie himself, that has received unto him a domestick Enemy stronger than himself? If the Disease bring a man down that was strong and in good health, how will it suffer him to be fortified when he is brought down? I speak not here of specifick Cordials, I let those alone also that recruit and illustrate the Spirits, and hinder their resolution; these are not to be deprived of their due esteem: but I censure only the abuse of comforting things. Now those which are truly such, are those that subduing the Morbifick causes add strength to the Bowels; that by correcting the Ferments, if any of them were weak, and restoring them to their pristine vigour, make them again mindful of their wonted office: In which matter we have the consent of Sennertus in his *Paralip. ad Institut. p. m. 79.* admonishing, That comforting or strengthening Medicines ought to be such which preserve and restore the Instruments of each Faculty, to wit, the Substance, Temper and Spirits of the Part, and that take away the Causes that violate them; and that therefore respect is always to be had to the Cause of the Disease, and the weakness of the Faculties, and heed is to be taken that whilst we strive to please the palate of the Patient, and to recruit his Spirits, we do not encrease the Cause of the Disease, and so also the very debility of the Faculties, especially by such things as in their whole kind are foreign, and have no congruence with the Spirits, nor are grateful to the weak Ferments of the Viscera. As to the usual Juleps, (without the conjunction of prevailing acid Spirits) Elestuaries, and Emulsions, and other Medicines of that Nature that easily Ferment, it is certain that they are very grateful to the Well, and to such as are in the declination of Fevers, where the Ferments of the Viscera have again in some measure attained their pristine vigour, as Galen testifies *Comment. 5. Epid. 14.* but they are naught for the Sick, and hurtful in most Diseases of the Stomach and Womb: for these being in a preternatural state, are only delighted with bitter, acrimonious and acid things: other Medicines are quite opposite to the Ferment of the Stomach, and so make the Digestions more difficult. Sugar (a common Ingredient in Cordial Juleps, &c.) being Chymically dissected, passes partly into a most ardent Spirit, partly into a Corrosive Salt; what then is this like to do in a Morbous condition of the Stomach, where all things are governless? In a nidorous Crudity it will be changed, like Proteus, into sulphureous dross; in an acid, it will pass into a corrosive Salt; where there is no doubt but that the preternatural scorbutick acid Salts are exalted by those of the Sugar, and that thereby there is given a greater occasion for the obstructions of the Viscera; also that febrile Ferments are encreased hereby. To which account, *H. ab Heer Lib. 1. Observat. 5.* long ago subscribed: It is certain, says he, that those who in Fevers have often taken Syrups, Conserves, and other Sugared Medicines, which most Physicians have used to prescribe, have many of them died; for I am certain that by the Sugar which easily turns to Choler, fuel is added to the Fever: whence Avenzoar writes, as Mercurialis cites him, that those who often use sweet things, can hardly be preserved. Shall that which is self is always prone to ferment, hinder other things from corruption and fermentation?

III. The more frequent use of Alexeteries is hurtful, left by custom Nature come to receive no benefit by them: *N. Bocca Angelinus cap. 32.* ¶ Great caution is needful that men indulge not themselves too much in the use of Cordials: For I have known many eminent both Men and Women from the more

frequent use of these fall into this bad custom, that it has become necessary to take a draught often in a day, either of some generous Wine, or Spirit, or of some Strong water: yea moreover (inasmuch as Nature being a little accustomed to Extraordinaries, remains not long content with the same) to encrease them daily, and to repeat them oftener; so that at length the Stomach could bear or digest nothing moderate, but still desired stronger and hotter: But the other Viscera, and especially the Liver have been so dried and parch'd thereby, that the Blood being lessened as to its quantity and depraved as to its Crasis, a morbidous Cacoehymie or shortning of life has superven'd. There are sundry occasions that bring men into this bad custom of sipping Cordial Liquors: for in sudden Faintings, which are perhaps occasion'd by great Grief, toylsome Labour, vast Sweats or acute Pain; also when one has eaten something that agrees not with his Stomach, but causes a weight and a Nausea; or when a swooning or stupor seems to be impendent through a Spasmodick disposition; yea for many other causes, it is usual to guzzle vinous Spirits: and then after that such Cordials being taken some time begin to be agreeable and delight, the mass of Blood being a little more freely expanded and more accended by every taste of them, the whole Hypostasis of the Soul is thereby amplified and excited into a kind of Ovation: which subsiding again, the Soul remembering that complacence, and being not content with her present state, affects the same again, and craves after more: Wherefore upon every trouble of Body or Mind, as soon as the Spirits quail a little, a Cordial draught is presently desired to raise them again; and so by the often unprofitable spreading of the sails of the Soul, the Fabrick of the Body it self, as of a ship, is shattered. Nor does this evil custom prevail only among drunken Companions; but sometimes learned Men, and fine and ingenious Women, that they may the more improve and exhilarate their Genius, by often sipping of hot Spirits and Waters, or of *Aqua Vite*, (although it be but improperly called so) undermine and often overturn their own health.

IV. When the Stomach languishes, thick Alexipharmacks are more commended than liquid, that they may stay there the longer: When the Heart is affected, liquid are better, because they penetrate more speedily, as *Prævotius* has experimented.

V. They are not convenient before an universal state of the Disease, lest they move the crude humors unseasonably, or carry them to the Heart: or lest by drawing them to the inner Parts they increase the Obstructions, shortness of Breath or Putrefaction: therefore let them be given after Concoction is finished.

VI. Some say that Cordials may be made to exert their vertue by the means of the circulated Blood, without taking them in at the mouth: The manner of Administration is this: Let the Arm be tyed above and below; then having emptied the Mediana, infuse a Cordial liquor through a Pipe made of a Lark's Bone, one end of which is fitted to an Oxe's Bladder, and the other put into the Mediana, (or some fair vein of the Foot) squeezing the Bladder: when the liquor is injected, shut the hole, remove the bandages, and the substance and virtue thereof will be carried to the Heart by means of the Circulation.

VII. The most Serene Prince *Christian Marquis* of Brandenburg died very old: His Corps being opened, the Heart being dissected sent forth a very grateful Odour, altogether like those Emulsions and Juleps (viz. *Confect. Alkermes*, Cinamon water, &c.) which had been given him some days before he died: An infallible Argument, that Medicines which are taken, stick not in the first

ways, but by a continued use they may penetrate to the very Heart with their virtue almost intire, and retaining their qualities, at least partly.

VIII. In Hypochondriacal cases Cordials are sometimes to be used; yet let Powders and Earths alone, as encreasing Obstructions.

IX. The Ancients mixed *crude leaf gold* with many Medicines: but to what purpose I pray, unless to please the Eyes? for its substance is too solid and compact, to be resolved and brought into act by our heat. Nor does it suffice that some determine the *Effluvia* of the Heart and Gold to be Sympathick, and therefore they give leaf-gold; for besides that, this supposition may be destroyed with the same facility as it is asserted without Reasons, it might be applied outwardly in greater plenty, and without doubt with greater profit, and less or no loss. ¶ But I think it is without doubt that being Chymically resolved and prepared it has many virtues, seeing Experience testifies it: But whether it have also a notable power of comforting the Heart and refreshing the Spirits in an occult manner, I leave every one to think what he will. It is safest that every one conclude in this case not as he has read or heard, but as he has himself experienced. But that Gold has many other virtues, is certain; but what those are, all say not alike: for there are some who take it almost for an universal Remedy; but although it cure many and those very dangerous Diseases, yet it removes not all; and those which it does remove, it will not do it alone, but there is need of other Medicines. But it is especially profitable in a Cacochymie that is pertinacious and fixed more closely in the Parts, in the same manner almost as Antimony rightly prepared: whence, as *Fr. Antonius* relates in his Treatise of *Aurum Potabile*, there follows upon the taking of it sometimes a Vomiting, sometimes a plentiful Pissing, and sometimes Purging by Stool, accordingly as the Humour and Nature incline to this or the other place. And he shall find this to be true who ever diligently considers the Histories of those that have been said to have been cured by *Aurum Potabile*.

& diff. c. 19.

X. Concerning the Preparation of *Antimonium Diaphoreticum*, although in Chymists Books it be very well order'd to be with a triple proportion of Nitre; nevertheless Artists do in some manner conceal those things which are fittest in each ones Art: Hence we have a mind to mention a few Cautions, and those light as to appearance. 1. The fire is diligently to be heeded, which ought to be a mean betwixt fusing and gentle; for if it be kindled in too gentle a degree, and the matter be put in before the Crucible be hot enough (wherein the stress of the whole operation lies) the Antimony is not rightly detonated, and its vomiting virtue is not quite destroyed, or at least it arrives not at the desired whiteness: And if the fire be too fiery, the Saline Particles do too closely receive the Antimonial to within themselves, and hence all the matter, through too great an ebullition, strives with great danger to fly over the edges of the Crucible, and afterwards the Medicine becomes none of the best. 2. The Nitre ought to be very well dried first, and not be moist, because otherwise the watery Atoms retard the Detonation, and oppose themselves to the fire, so that the impure sulphureous part cannot rightly deflagrate. 3. Heed must be taken also that it be not too much fixed, nor stay too long in the fire; for then it remains very light, and its Sudorifick virtue is almost abolished, the Dioretick remaining: whence it is best, as soon as the detonation is over, to cast it presently by little and little into cold water (but if you put in too much at once, the bottom of the pot will be in danger of falling out) and then let it be

rightly (elutriated or) drained: On this manner you have a Diaphoretick Antimony of a good white, joined with no yellow; and although it be precipitated afterwards in Vinegar, there will depart from it little or no Magisterie. Those things that are commonly said of it, viz. that it returns to its pristine Nature as soon as the fixing Particles of the Nitre are evaporated, whence 'tis advised that it should only be given when 'tis new; or to be burnt again with the Spirit of Wine, all these things are to be understood only of this Medicine when it is not rightly prepared: for Experience testifies that this fear is wholly groundless, if the procedure be according to Art.

XI. That I may confess it ingenuously, no great trust is to be had to the Bezoar-stone: Seeing although those Faculties be granted to the true Bezoar-stone that are ascribed to it, yet because its dearth makes many that sell it endeavour to counterfeit it, we can hardly have any but what are adulterate. The Writers of Indian Affairs themselves, witness that it is rare and very dear among the Indians, whereas with us it is plentiful and cheap enough.

XII. Some give a great quantity of this Stone, seeing it has no hurtful quality, viz. to twenty or thirty Grains. *Zacutus* ascends to a Drachm: This he confirms with the History of one *Eleanor*, who falling into a very Malignant Fever, and taking a very great quantity of Bezoar, a Drachm at a draught, escaped very well; whereas all his Patients that by Contagion were seized upon by the same Disease, who had a small Dose given them, died. The most hurtful quality of Poisons seems to evince the necessity of a large Dose, in that it proceeds not slowly, nor promises a secure Truce. If thou encounter the Plague slowly, thou shalt be conquer'd and not conquer: The middle way is the safest, because the extreme on both sides is a fault: The small Dose of three Grains hath not that strength as to resist Poisons and the Plague, a large Dose burthens the Stomach, seeing it ought to be repeated: This seems convenient: Take of Oriental Bezoar-stone and of Emerald prepared of each six Grains. The exhibition of Alexipharmacks loves not Unity; one Dose takes not away the fountain of the evil; that which does not its office at once giving, must be given twice or thrice: an equal contrariety is to be attended, as in the Dose, so also in the Repetition.

XIII. *Hartshorn* is not much worse than the Bezoar-stone or Unicorn's Horn, against Poisons and Poisonous Diseases: for it defends the Heart from malignant Vapours; it cuts the toughness of Humours, it opens the Obstructions of the inward Viscera, and by its penetrating quality resists the Putrefaction of the Humours, and by a certain Balsamick virtue corrects their malignity; whence by *Joubertus* it is called a great Cordial. But it is to be given calcin'd and prepar'd, not crude; seeing when it is given crude, it often passes out by Stool as it was taken, without any alteration: for its spirituous substance, that is the cause of all its action, whilst it is bound by the feculent matter which the Hartshorn consists of besides, is hindered from exerting its virtue, so that in the crude it lies as it were buried: yea neither can the Salt exert the virtues of its Balsam, unless it be freed from its earthy Bands. Seeing therefore the Diaphoretick virtue (says *Horsius Probl. Med. Dec. 1. q. 4.*) which is in this Medicine through its fixed Salt, together with other qualities, is very much set at liberty from its Impediments after Calcination and Preparation; we therefore conclude that Hartshorn burnt and prepared is more convenient than crude; yea this Medicine is so safe and pleasant even in the greatest Diseases, that, Necessity urging, it may be given very profitably to every age, even to Infants new Born. Let the same

same judgment be past upon the Bone of a Stag's Heart, which I think unprofitable, unless it be calcin'd and prepar'd.

XIV. The virtue of *Hartshorn* consists chiefly in a volatile Salt and Sulphur, with which the Bones of Animals abounding, that which is pure they take for their Nourishment; what is superfluous, they thrust to the extremities of the Bones: this luxuriant matter being long exposed to the Air, after a year is fasten'd and vitriolated as it were, passing into hard ragged and great Horns, through the volatile and extensile Nature of its Balsam, and hence it is believed to be a great Cordial, and a true secondary Bezoardick: for by its Spirit (which is altogether of the same Nature with that of the Blood) it recreates the Heart; by its sweet Balsam it cherishes the radical moisture; by its Armoniack Salt it penetrates, and attenuates tartareous Matters, provokes Sweat and Urine, and therefore opposes a pestiferous Air: And by its drying virtue, which remains in its Earth, it drives away Putrefaction, kills Worms, helps Fluxes of the Belly; whence for divers Indications, divers Preparations also of Hartshorn are to be used: Thus in an Ethereal Plague and Poisons I use the Spirit and armoniack Salt of Hartshorn as a notable Diaphoretick: In malignant Fevers, as the small Pox, where the whole mass of Blood is not only accended, but also putrefied, I use secondary Preparations that are derived from its whole substance, namely Decoctions of it, Gellies and Extracts: for Swooning I use the Water distilled from the (typhi, or) snags of fresh Horns: for a Pthitick and retarding old Age I use the sweet Balsam thereof: for Worms and *Diarrhæa's* I use the Horn vitriolated.

XV. Here the negligence or unskilfulness of some Apothecaries is to be noted, that burn *Hartshorn* not in melting Pots, but simply among the Coals: this indeed is a compendious Preparation, but such as is hurtful to the Patient; seeing Coals have a malignant vapour in them, which is manifest in those that draw it in with their Breath in a close place.

XVI. Although those Animals be not known, from whom the Horns call'd *Unicorn's-horns* are taken, yet their virtue is not therefore to be denied, which is only known by Experience: for let any one (that would make tryal of a piece of this Horn) give some Poison to a Whelp or Pullet, and if he find that by giving a little of this Horn in Powder the Animal escape, he will find reason to esteem it as a good Medicine. If we approve of Hartshorn, why should the same Faculty be denied to other Horns? Therefore I would not morosely inquire whether they be the Horns of the Unicorn or of some other Animal, so long as they are good and effectual: for it is certain that both Elephants Teeth, and Whale Bone, and the Teeth of the Sea-Horse, and common Horns adust, and Horns digg'd out of the ground, and other factitious ones are often sold for the true Unicorn's-Horn.

XVII. If Treacle be taken daily to a Grain, it makes the Body Poyson-proof, (without inflaming) as *Galen* reports it happen'd to King *Mithridates*. I have seen many who have been subject to Swoonings without evident cause, cured on this manner: and it is an excellent Remedy, where we have suspicion of any poisonous matter lurking in our Bodies.

XVIII. Let children abstain wholly from Treacle, for their Age is too weak to indure so potent a Medicine, and it colliques their Body, and wastes their Primiægenial heat, like as the light of a Lamp is extinguished by pouring too much oil into it. I have seen a Boy that died through the unseasonable use of Treacle: He had been feverish a long time, and his Body being wasted, his Strength

was gone; his Guardian compelled me against my judgement to prescribe him some Treacle, which he could not concoct when he had taken it; for it was above the strength of the Boy, and dissolv'd the habit of his Body, &c. so that he died that very Night. Whether it be altogether to be denied to Children, See *Galen Tit. de Morbis Infant. Lib. 9.*

XIX. As we must guess at the degree of the Poisonous infection of the Blood and Heart, so also at the Dose of the Alexipharmack Remedy: a little quantity cannot resist the great Malignity in acute Fevers or the Plague, as suppose one or two small Doses of Treacle, or of a Sudorifick Bezoardick Tincture: Such plenty is to be prescribed as may drive out the Poison by large Sweats. Thus was a Sanguine Country-fellow (being of a good habit of Body) freed from the Plague by taking a Drachm of Treacle, and laying so many Cloaths upon him as made him sweat. Yet let not the quantity be too great: One being struck with fear in the time of Contagion, took a little Treacle, whence Sweat followed on the Night: the day after he took some more; he repeated it the third time, believing that some Contagion lay hid; so that in all he took at least four or five Drachms: on the Night following he was taken with a most burning Fever, and Pulules also arose. Treacle, seeing it is hot in the second, and dry in the third degree, by reason of its driness must not be given to above a Drachm, though in respect of its heat we may ascend higher.

XX. Whether is there a Cordial virtue in Precious Stones and their Magisteries? Many laugh at their virtues, others suspect them; hence are many Compositions, amongst which *Confectio de Hyacintho* is famous, being noted for many virtues. *Avenzoar*, *Mindererus*, and *Zacutus* attribute great virtues to the Emerald. But the simple Preparation of Stones ought to be more esteemed than their Magisteries; seeing 'tis doubtful whence these latter have their virtue, whether from the proper form, or from the *Menstrua* or Dissolvents; if from these latter, they will do more harm than good: and seeing the weight of the Magisteries is often greater than that of the matter to be extracted, was before; it breeds a suspicion that therefore part of the *Menstruum*, whether it be vitriolate, tartareous, or have the Nature of any other Salt, insinuates it self into the Magistery, and is to be washed out of it by no Art. The weight indeed is increased in the simple Preparation of them, but that happens from another cause, namely, because the Air contained in their Pores whilst they were whole, vanishes upon their grinding; or because by the long agitation of them upon a Marble, something parts from it, and mixes with the prepared Medicine: but this is less hurtful than the corroding *Menstruum* added to the Magisteries. *Laur. Hofman* writes, That the Bishop of *Breslaw* often drank the Magistery of Perls, and that when he died, the coats of his Stomach appear'd black and corrupted. *Libavius* shews by some examples that many have fallen into a Consumption by the use of the Magistery of Perls and Corals: and that many have died thereby, the coats of their Stomach and Guts being plainly eroded by their acrimony.

XXI. One Drachm of Magisteries rightly prepared can do more than an Ounce or more of the vulgar unprofitable and unwholsom precipitated Magisteries: seeing these being taken into the Body do only like slak't Lime (as it were) whiten over the Stomach and Guts, and oppress them by sticking long upon them undissolv'd; or if they glide out of the Stomach, by obstructing the Mesaraick Vessels, and hindring Concoction, they are apt to cause at length grievous Diseases: I will confirm this by an Instance: A Nobleman complained of a weight of his Breast and Stomach, of a nausea, want of Appetite with a lingering but continual Fever, though he used a very

good diet, and Cordial and Cephalick Powders. Although he were naturally weak, yet I thought good to begin the Cure with some general Remedy; and suspecting from his *nausea* that some crude matter stuck in his Stomach and its upper Orifice, I got him to consent to take a gentle Vomit, which wrought very gently twice upwards and thrice downwards. In the afternoon I found him pretty well, and he told me that he found great ease about his *precordia*. His Lady bringing out a Silver basin shewed me what he had Vomited, which was about a quart of thick and viscid Phlegm, in the bottom whereof there was a Powder, like white ashes, a Fingers thick, for a sediment. Looking upon his Stools also, they likewise lookt just as if they had been mingled with a great deal of ashes. Now several dayes before, he had taken daily a precious Powder, almost of the same colour, made of the Magisteries of Perls and Corals, of Harts-horn burnt and prepared and an Epileptick Powder, &c. ¶ It is to be noted that the greatly cryed up Magisteries prepared of Coral, Perl, &c. especially by the Oyl of Tartar, answer not the promises of their Authors, seeing by such preparation, their vertue to temper, fix and concentrate acids, is broken, if not quite abolished: It is therefore better to use them only reduced into a fine Powder, than so prepared or rather corrupted.

Zwelff. append. ad animadv. in Pharm. Aug. p. m. 92.

Franc. de le Boë Sylvius Tract. l. 1. c. 7.

XXII. In the dissolution of Perles it is a common error to pour distilled Vinegar upon them. For it is sure the Liquor that ascends in distilling of it is insipid and altogether unfit for dissolving of Perles; and that which remains in the bottom after distillation, by its corrosive vertue dissolves both Perles and other things, and reduces them into a powder as it were and calcines them: now this is not to draw out the Spirit of perles, but to corrupt their whole substance. The Bishop above mentioned took often of such magistry of perl as this, and when he was dead the coats of his Stomach appeared black and corrupted: Marquess John's Lady had the same hap, in whom the Coats of the Stomach were plainly eroded. There is indeed hardly any Glass that it is kept in, so firm, but it will erode it and turn it to ashes.

Monav. in Epist. Schol. 12. Ep. 163.

XXIII. Among Alexipharmacks *Tormentil* and *Bole*, are worth for those who have a dry Belly: *Danc. Liddel. l. 3. c. 5.* for by their earthy adriiction they cause obstruction and putrefaction.

XXIV. Left those who are accustomed to the use of the Volatil Salt of Vipers, find unexpected effects of it and such as are contrary to its Nature; I would admonish them that they carefully avoid the mixing any thing with it that is very acid, especially Spirits, such as are these of Salt, Vitriol, Sulphur and the like, for by these it would be fixed, and its operation wholly hindered.

M. Charraz tr. lat. de vipera c. 9.

XXV. Sulphureous Spirits kindle the Sulphur of the Blood, Volatil Urinous ones rarefie it, and Acid Spirits tame and dull or blunt it: All these used inwardly restore the heat and motion of the Blood, encrease and vigoate its balsamick oleous parts: whence Apoplectick, Hysterick, Cordial Spirits and the like revive the Spirits, remove fainting, and recall the languishing faculties. But seeing both these and the rest are very active, they are all of them to be given warily: For being given unseasonably, 1. they fill the head and intoxicate; 2. they deject the appetite, which yet, being used moderately, they are in their own Nature rather apt to restore, by exciting the heat of the Stomach: 3. they make men Phthical and Hydropical; the former, by consuming the dewy Nectar of the parts, the Serum, and by making the Humours more acrimonious; the latter, by destroying the tone and temperature of the Viscera: Whence Hofman in his Preface *De medic. Officin.* writes rightly, that

our Countrey Brandy whether it be made of the Lees of Wine, or of Wheat or Spelt, or of Juniper-berries, is so hurtful to the Liver, that in two or three months by bringing a colligation it causes a Dropsie that is deadly to all that fall into it. I have often observed the same thing myself, that all those stout drinkers of Brandy have at length become phthical or Dropsical or both. But Urinous Spirits rarefie the Blood, and by making the Serum halituous and fluxile, provoke sweat; whence whensoever there is need of volatilising, let these be at hand; for they promote motion and heat far more powerfully than the Spirit of Wine; they expell also, whence they are very powerful in driving out the small Pox; they drive away drowziness in the Apoplexy, Epilepsie, and fits of the Mother; hence they are good in malignant diseases, if any be: but we must take heed that by too much rarifying we do not dissolve the Blood and hasten death. Hence those admirable effects are to be referred hither that are here and there ascribed to them, as Hartman relates of the Spirit of Soot that it has raised to life again those that were even a dying. Neither yet is there any reason why we should so much esteem the Spirit of Vipers and Soot that is more stinking and ungrateful, so as that we should attribute more to them than to others; for as good as any, are, of the more Sulphureous and Bezoardick, the Spirit of Ivory and Harts horn, and of the purer, the Spirit of Sal armoniack. Lastly seeing Acids tame and blunt the Sulphur of the Blood, acid Spirits do this in general, yet these also vary in regard of special effects and qualities; thus Spirit of Vitriol is hurtful to the Breast, the Spirit of Nitre is an Anticolic, the Spirit of Salt performs all the offices of an acid in the first degree as it were and indifferently: The rest are to be referred to these.

Wedel. Pharm. p. 201.

XXVI. Such Gellies are to be chosen as are 1. new, for old grow rancid, and have an ingrateful and musty taste: 2. such as are tender and whitish, not the black, dusky, hard like horn, or such as are not at all grateful or agreeable to the Stomach: hence when not many years ago a very great quantity of Harts-horn Gelly was given to a Child of a noble Family lying ill of the small Pox, by the advice of an eminent Physician, and thereupon a little before his death he begun to vomit blackish stuff, much like the Gelly in colour, and a short while after died, the Physician lost a great deal of credit by it: Also 3. let them be liquable, such as will melt of their own accord as it were upon the tongue, and slip down pleasantly. Mucilages and Gellies have a very noble use in driness and chapping of the Tongue in fevers, for they allay the acrimony of the Humours, the Serum and choler, which they make more slimy and thick; they temper the fervour of the Blood and keep its consistence in safety, that its fibres part not too much from one another: They also quench thirst, by allaying not only the heat of the Stomach but of the Lungs also, whence thirst chiefly springs: yet the Stomach is not to be bird-limed as it were with all of them. They are good also for taming and blunting the wasting ferment of the Blood in Hysterick and Phthical persons. Yet in all of them respect is to be had to the Stomach, lest its ferment be too much blunted by them, or the tone of its substance be loosened.

What Medicines are said to be moist, and what dry. VII.

Whether Wine be hot or dry. *ibid.*

Of the alteration of Humours according to the Moderns and of the preparation of them. VIII.

I. **T**Hose Medicines are called temperate *a priori* or in themselves, wherein the active and passive qualities temper one another, or which exceed in neither, nor are so furnished with the active Principles, *viz.* Salt, Sulphur and Mercury, that any of these do sensibly predominate; but the particles are so commensurated among themselves, that there cannot be observed the excess of one above another. And those are called temperate *a posteriori* or as to their effects, which neither heighten nor diminish our native heat, but do kindly cherish and preserve it, so long as they keep within the bounds of their mediocrity; and they are generally in a manner alimentous, and such as one can hardly exceed in the use of them. But these have a great latitude, so that those are properly called temperate, which otherwise are reckoned to be hot, cold, moist or dry in the first degree. A sign of this is, that they leave behind them no excess at all in taste, smell or effect. And so as to temperate Medicines, note 1. that many of them are aliments; 2. they are convenient for lenifying the heat; 3. they digest and are paregorick; 4. they are good for mitigating roughness in the throat, or any other; 5. especially in the *Phthisis* and hot Diseases; 6. for they strengthen, and demulce the pores, and so are temperate also inwardly.

II. Authors are wont to deliberate 1. of Degrees in the qualities of Medicines; for seeing even by comparing Mixts to one another some are more furnished with some of the active principles, *viz.* Salt, Sulphur and Mercury (for from these we will chiefly deduce the Faculties of Mixts, as the *Aristotelians* and *Galenists* derive them more from Elements) and others alter the Body more, whether in active or in passive qualities; some heat more, others moisten more, &c. we may easily gather that there are some degrees to be granted, as differences and terms of acting, or a certain propriety, which is Geometrical, not Arithmetical: And so there are two axioms and certain *Postulata*, 1. that Mixts do alter the Body; 2. that they alter more or less evidently, or weakly, or most manifestly; whence there are four degrees concluded upon: But besides the degrees, there are 2. *mansions* of the degrees: Which although some deride, yet this distinction is necessary in the active qualities: For if it be true that there is a great latitude of these, and that all cannot be included in strict limits, why may not one inquire into these more narrowly, yet so that we may indeed the more express the latitude it self, and yet not thereby confound our understandings?

III. Those Medicines therefore are said to be *hot a priori*, or in themselves, whose consistence is so framed, that the active Principles, Salt, Sulphur and Mercury, but especially the Sulphur and volatile Salt have a certain prerogative, and that more or less, which is manifested chiefly by the smell and taste: but the other passive principles are subjected to these. And indeed those are to be esteemed hot in the first degree in which the aforesaid principles predominate gently, sparingly and moderately; or are only superficially present, and not intimately and thoroughly dispersed, or are not at their own liberty but blunted by earthy and watry particles. For the active principles, Salt, Sulphur and Mercury, lend this temper to Mixts; and the passive, water and earth modify it. Those Medicines are called *hot a posteriori*, or from their effect, which indeed alter our heat, but without any notable energie, by little and little, obscurely and hardly sensibly.

Thus, *hot in the first degree* are most of those that are called temperate, whether they be herbs, roots, flowers, woods or other mixts that are less odoriferous, and that have no excessive and notable taste; whether they be also *Emollients*, such as have a moderate humidity withal, as mucilaginous and fat; or *Digesting*, as the rest. These have place in divers diseases, they open gently, strengthen, discuss, soften and temper. As to their taste, the hot in this first degree are *fat* and *insipid*, yet with a gentle tang of volatility, whither also are referred by some, Mercurial plants, Porcelain, Mercury, Pellitory, *sweet*, as Lyquorish: *earthy*, which have a kind of a volatile farewell, as Fumitory, Liverwort: *Odoriferous*, which have not a taste answerable, as the flowers of the Linden-tree, primroses.

Hot in the second degree a priori, or in the mixture it self, are such as have Sulphur and Salt, volatile or fixt, more eminent: whence such are 1. *bitter*, as Wormwood, Aloes, Birthwort, *Cardus Benedictus*, Germander, *Gratiola*, or Hedge-hyssop, &c. 2. *resinous*, Balsamick, Spirituous, as tops of Pine, Marigold, Amber, Myrrhe, Turpentine, Spirit of Wine, Balsam, gum Ammoniack, &c. 3. *somewhat acrimonious*, as Rocket-seed, Jalap, and other not very strong purgers: 4. *saline*, or middle Salts, as Tartar vitriolate: 5. *middle Aromaticks*, as Balm, Cinnamon, &c. *Hot in the second degree a posteriori*, or in their operation, are those which exceeding more manifestly, sensibly and notably in smell and taste or both, do alter, but yet without trouble or hurt, so that as yet they may be endured, though with manifest alteration: And so these have a middle place as it were, they strengthen, open, provoke the Terms, absterge, alter, and perform their other Offices more strongly than the former: They are also Balsamick, such as preserve the vigour of the Blood intire, and avail to long life.

Hot in the third degree a priori are those wherein volatile, or fixt Salt do more eminently predominate, with or without an accession of Sulphur: whence belong hither, for instance, 1. *all volatil Salts*, as of Scurvigrass, Cresses, *asarum*, &c. 2. *lividial Salts*, or the fixed Salts of plants: 3. *acids*, which have also an acrimonious virtue: 4. *acrimonious* and biting things, as Pepper, Burnet: 5. *stronger Aromaticks*, as Cloves, Mace, &c. *A posteriori* those which alter manifestly, sensibly, and with hurt as it were, if there be any excess, so that neither the tongue can endure them long without trouble, nor the body in any great quantity: Whence these rarifie the Body more, increase its Sulphur and volatile Salt, tame the fixing Humours, take away a cachexie, discuss wind, open the pores of the Nerves, and so are good in the Palsie, are antiscorbutick, powerfully break the Stone, refresh the weak Spirits, and rouse the Apoplectical and Hyterical.

Hot in the fourth Degree à priori are those which have a more acrimonious and almost caustick Salt, (whether *volatil*, as Onions, Pepper-wort; or *fixed*, as Mercury sublimate) which predominates over the Sulphur it self although present; whence such are 1. most acrimonious, 2. rubifying, 3. eroding: hence they afford vesicatories and potential Causticks, that erode and corrupt more strongly. *A posteriori* those which are of the greatest activity, most vehement and as it were instantaneous operation, and not without great hurt. Yet these also have their certain mansions, for Arsenick operates more powerfully and sooner than Onions, &c.

IV. *Medicines cold à priori* are such wherein there are no volatile, hot, acrimonious, aromack or aereal particles, but the active principles, particularly the Sulphur and Mercury, are more sparing, or subjugated; and the Salt in like manner is either absent, or has attained a fluor, and is remarkable for inverted acid particles: or else they are such in which the passive principles, water and earth, are found more prevailing, and the acid Salt as aforesaid. Cold Medicines are opposed to hot, even in their actions; so, for example, acids fix the bitter and acrimonious, obtund the oily, and so forward. *A posteriori* those which being referred to our heat, do not encrease it, but demulce it when it is ungovernable, and bridle choler. For as the hot rarefie the Blood, exalt the Sulphur with their sharp darts, and acuate the volatil Salt; so the cold do concentrate the same, deprefs its Sulphur, and fix and coagulate its volatile Salt.

Those chiefly are in this place reckoned for cold that are *univocally* such, which, for example, either dilute and demulce, as 1. watry; whence Juleps, the whey of Goats milk, the decoction of Barly, the juice of Birch, of Quinces, and other acidulous juices, (which most of them are such in the first degree, and others moistning withal) do notably cool: so also all *muclaginous* and *purely gumous* are cold, as the white of an Egg, Tragacanth, Harts-horn, Aloes, Mans-Skull, Gellies, the root of marsh-Mallow, Gum Arabick, the four greater and four lesser cold Seeds, which have a certain oiliness, but such as is watry and temperate: Or they *tame and infringe the Sulphur and volatile Salt*, as 2. *Acid*, juice of Citron, Sorrel, Berberries, and 3. *nitrous*, Pellitory, Mercury, Spinach, Orach, Violet: Or they *respect ebullition and motion*, as *precipitants*, as 4. *earthy*, for example, plants, the flowers of Balaufrins, parts of this nature of Animals and Minerals, also Woods, as Sanders, Oak, and especially those which are properly called *earthy*, as bole-Armene, *terra Lemnia*, &c. Stones, as crystal, jacinth, and those which are of an alkaline Nature: Or they *constipate and constringe*, as 5. *austere*, Hyptick, sower, which are examples of the third degree, Tormentil, snake-weed, the rind of Pomegranats, *acacia* or the juice of Sloes, *hypocistis*: Or they *plainly destroy*, as 6. *poisonous*, which are endued with an excrementitious earthy and watry, and with a stinking and impure Sulphur, and so induce a contrary consistence on the Blood, as Hemlock, Henbane, *Stramonium* or apple of Peru, whence they are poisonous: As Medicines hot in the fourth degree kill by eroding, so those cold in the same degree by suffocating and coagulating.

Medicines cold *Equivocally* and energetically, are those which either dissipate and procure the exhalation of Sulphureous soots, as prevailing by a volatil Sulphur and being themselves hot, as Spirit of Wine, camphor: or *take away the Cause*, (as well the fermentation and ebullition, as obstructions,) as openers. Such namely as are Sulphureous, are all of them heating, unless they serve for dissipation and hot exhalation, on which account they cool by accident: the Lixivial Saline do more rarefie the Blood, and so do also heat it: but the

Acid do concentrate and refrigerate the same: the mean, as Tartar vitriolate, are of a middle nature, but they rather commonly heat, cut Phlegm, &c. especially common Salt. So that the cold may be referred to the *summa Genera* as it were, as consisting of watry, earthy and non-lixivial Saline particles.

V. Here the question may be determined, whether Acids be cold or hot. For there are not wanting some that affirm them to be hot, arguing from their acrimony, biting, and that corrosive vertue that they are endued with: Those that maintain them to be cold, produce their effects also that are manifestly cold, as for example, that acid Spirits allay thirst, and cool the Body by blunting the bilious Humours. Here seems necessary a distinction, first between the hot Sulphureous, and the hot Saline; secondly between the external use and the internal, or between that which belongs to the solid parts, and that which belongs to the moist and spirituous. The hot Sulphureous, that is, those which have Sulphur predominant, chiefly with a volatil Salt, do all of them increase our natural heat; but those that want Sulphur, and possess a fluid Salt, as Acids, have indeed acrimonious, cold, biting particles; but he would be absurd that should use them for restoring or invigorating the innate heat, or the Sulphur and volatile Salt: Whence although in their external use they cause an erosion in the solid Parts, and through their acrimony cause the Parts to be pained and grow red, which very thing we may also observe in a more tender Stomach, and from a larger Dose, as the Patients do sometimes perceive an *æstus* and heat from the unwary use of the Spirit of Vitriol; yet with relation and respect to the Blood, to our heat, or to the Heart, they are, and are deservedly called, cold. Others determine, that they cool by accident, inasmuch as being joyned with cold vehicles, by their penetrating vertue they make those more apt to cool: others otherwise; as for instance, that they cool by the perspiration of the fiery heat, &c. There is the like reason also of the nitrous, for through the disposition of their foursquare or sexangular particles (for instance) they express a manifest sense of cold even upon the Tongue. Therefore it is better to call them cold effectively, and rather to reckon them among the cold than the hot: yea it were better to know their nature more intimately.

VI. There is a doubt about some bitter Medicines, that are reckoned among the cold, as Lettuce, Cichory, Endive, Sow-thistle, Poppy, Sallow; by whose example there are some that deny that assertion of Galen, *That all bitter things are hot*, as particularly *Averroes* and Others: But the answer is the same as we gave of odoriferous, to wit, bitter things, as such, are all hot; yet nevertheless some of them are called cold, partly because their bitterness is but very little, and is subjugated by the abounding moist Parts; partly because their effect is equivocal; as for example, Liverwort is reckoned among the cooling Hepaticks, yet it rather performs that by that effect whereby it opens Obstructions, absterges Choler, &c.

VII. As to the passive qualities, *moist* and *dry*, it is to be noted, that the denomination is deservedly taken from the active, as being the more worthy; whence those that are eminently hot, are for the most part dry, unless they be substantially moist: (whence *Hofman* affirms of Wine, that as to its quality it dries, but as to its substance it moistens.) But those which are eminently cold, the same (saving an exception) are most of them also moist. We will here repeat our Hypothesis that is proved in another place, that there are two alimentary Humours, the principal the Blood, and the ministring the Serum: As therefore the active qualities, heat and cold, respect and attend the in-

nate

nate heat, or blood, and the oily and volatil parts of the same: so moist and dry Alteratives dispose the Serum; the moist are those which preserve, restore and increase the Serum; the dry those which diminish, waste and devour it. Nor hinders it that some are actually moist, and yet do dry, through their prevailing Sulphur (for instance;) and that some are actually dry and yet moisten, through a predominant aqueous quality, as Gellies, &c. What we said also of the degrees of heat may be applied here; and yet it is to be noted that there are no Humids in an excessive degree, unless one will call those so which are such substantially; for the same things are predicated also both of those that are potentially such, which are indued with watry, mucilaginous parts; and of those that are actually such, which themselves also differ in degrees: Thus simple and distilled waters, Whey, decoction of Barly with Harts-horn, Beer and Wine moisten, but in different degrees: Or respect is had to the coldness joyned withal; whence Henbane, Poppy, Nightshade, are said to be moist in the third degree; the juice of Lettuce is esteemed poisonous. Moist in the first degree are those which are endued with Particles that are weakly watry and mucilaginous: In the second, those which have the same more evidently. But in general the Mucilaginous do moisten more, and as it were substantially, because they are harderly dissipated; and the watry less, because they are sooner dissipated. Hence in driness of the Throat, and in parchedness and chaps of the Tongue, Practitioners use to prescribe the Mucilages of the Seeds of Quinces, of Flea-bain with the Syrup of Violets, &c. Also those that excel in Fat and Oily parts: hence there are adstringent ointments and liniments properly and in their own nature: so also succulent, green, pulpous and carnisous things are moist: In like manner the oyl of sweet Almonds and Water-gruel are very profitable in that case. Likewise in a squalid and withered habit of Body, as for example in the Hectick and in an atrophic of the parts, besmearings with oyls and fat things, also with mucilaginous themselves (as the root of Comphrey) are more convenient. So the eyes also delight in mucilaginous things, as the white of an Egg, &c. Likewise to smooth and demulce in hoarseness, diseases of the Lungs, Kidneys, &c. This also is to be noted, that driers in the fourth degree, are hot also in the fourth degree: & so cold does modifie moisture, heat driness, at least for the most part: and as preternatural heat requires cold Medicines, so preternatural moisture or ichors require drying.

Driers are those that have the earthy particles predominant, whether alone, or joyned with Sulphureous, or with acid or some other, whence they absorb or dry up greatly; and hence (for instance) chalk, ceruss, lac lune, pompholix, are notable for drying up ichorous humidities: So ulcers that will not fill up with flesh, but are exasperated with Emplasticks, are helped by such dry powders as these; which I have often seen with happy success, sometimes mixing hot things with them (as the powder of the leaves of Birthwort) and sometimes earthy. Hither belong drying and strengthening decoctions and fomentations, such as are often used of Alum, Nitre, Sulphur, &c.

VIII. Alteratives are commonly described by those Medicines that are endued with the vulgar faculty of heating, cooling, moistening, drying, attenuating and incrassating; but these respect not so much the disease as the symptoms: Whence Sennerius himself says, To use refrigerating Medicines, at least because of heat, and not first to take away the matter that is the fuel of the febrile heat, is to cure the Symptom and make the disease worse. Therefore let your Elementary Physicians, who respecting only the urgency of the Symptoms, inquire of the Patient or those that attend upon him concerning nothing

but heat or cold; know that such qualities are mere effects of the Diseases and the Morbifick cause, or products from the furious Archæus; for while it endeavours to expel the strange guest, it raises sometimes cold, sometimes heat.

Alteration therefore is a motion, as to a passible quality, whereby there is caused not another thing, but another manner of thing: And it is either correlative or perfective. A correlative alteration is that whereby a former quality is abolished, and a worse is induced, as is done in the generation of Diseases: A perfective is that whereby a new quality is induced for the perfection of another, which is meant in this place, and we describe it by motion, whereby preternatural and strange qualities, that deprave or corrupt the ferments of the viscera, the mass of Blood and other parts of the Body, are abolished by adjuvant altering Medicines, and whereby the domestick and natural are corrected, and reduced as much as may be, to that natural equability and proportion from which they were departed, that health may ensue from thence.

Alteration therefore is a motion, because it leads to a more perfect being, whereby are acquired qualities agreeable to Nature being repaired by altering Medicines, that perfect health may accrew thereby. Now by these Qualities we understand not only the first elementary, active and passive, viz. hot, cold, moist and dry; nor only the second and such as flow from the modus of the substance, from the various texture of the Parts in the Blood; which, as was said, are nothing else but the products of the Disease or matter, whose departures from a natural estate are easily reparable: but we admit also occult qualities, which are made of ferments that our Soul uses for the performing of its actions, which are such accidents as are immediately in the subject whose they are, and on which they immediately depend, and with which they are transmuted: Thus, for instance, it is impossible, that Acid, or Bitter, or Salt, or other qualities contained in the mass of Blood, should be changed, and not their subjects changed withal, on which they depend as on ferments, and in which they are as accidents. Hence Hippocrates, lib. de pris. med. uses not so much the word ἀλλοιωσις alteration, as μίξις and μέλις, mixture and collon, by means whereof what is disordered is to be restored. Whence also it will much concern a Physician to know in the first place from what principles or ferments such qualities are immediately raised; and then how one is to be changed into another; as for example, how from an acid a sweet may be made, or of a sweet an acid; from a bitter and acid a sour, from an insipid a Salt, from a malignant a benign, &c. For he that knows this, shall easily correct the preternatural ferments of these qualities, that arise, by departing from others in an undue quantity, quality and motion, or when by their fermentative virtues they either invade those of a contrary Nature that are joyn'd with them, or snatch along with them those that they meet with like themselves; or they themselves, where they are either overcome by more powerful, or draw weaker to themselves, do put on divers Natures. In a state of health many things are incorporated with us, and subdued; which if they be not, they degenerate into filth, they violate the vital principle by changing the ferments of the parts, whence, the Archæus is disturbed diversly, and the vital œconomy prejudic'd.

As therefore the said Qualities are not to be defined by the first qualities only, as bare accidents of diseases and morbid causes, but are furnished rather with Hippocrates's Symplics or powers: so neither do altering Medicines themselves simply partake of an elementary nature, but there lie hid in them other noble and occult qualities, by which in their whole substance and appropriation they are contrary

ry to this or that disease; whence we should not have regard only to hot or cold, &c. but also to Acid, Salt, Bitter, and other occult and foreign powers resulting from the ferments whereby man is affected; and, if it may be, we should search out Specifick simple Remedies for all diseases. Wherefore seeing Hippocrates teaches, that distempers happen to a man *à diversum* from the powers, and by them understands the efficacies and vertues of the juices; let us see how we can invent Remedies that are fitly opposite to them, and are furnished also with their powers or Specifick ferments. If therefore there be a malignant fever, and the Blood do thence too much effervesce through the febrile and poisonous ferment; such altering Remedies surely are to be used, as not only fix and precipitate the febrile ferment, but also withal resist its malignity and are Alexipharmack.

Hitherto of the formal cause of Alteration, its Efficient cause is next to be inquired: and we determine it to be the fermental heat of the *Viscera*, that by the help of altering Medicines, which also have their ferments, subdues the morbifick matter, transmutes it, and in due manner afterwards expels it: for if the vertue of this fermental heat, and its Balsamick saltiness by chance be altered, or suppressed, or otherwise become weak; being changed, increased, or restored by the said Alteratives, it can easily afterwards subdue and conquer the vicious matter, that is, make it so fluid, that it may afterwards be thrown off without difficulty.

Therefore we must inquire how alterative Medicines, as to their internal vertues, and their very Nature and substance, are with respect both to the ferments of the *Viscera*, and also to the morbifick causes and *Archeus*.

Now we must know that Alteratives perform their Offices by qualities either manifest, or occult. The manifest operate by means of a certain Precipitation, taken largely, only as it denotes dissolution, and such a disposition as is not procured without a previous destruction of the morbifick ferments, (the natural ones being restored by the ferments of the Medicines,) a taming of the Humours produced by fierce ferments, a division of the continuous and heterogeneous, a segregation of the contiguous, and on the contrary a congregation of the homogeneous, lastly without a strengthening of the whole Nature: For the furious ferments of the Humours being destroyed and extinct, and the fierceness of those things produced thereby being mitigated, the activity and vertue of the Natural ferments that before was languid, being assisted by the ferments of the altering Medicines, do emerge again as it were, by promoting the subduing of the morbifick matter, so that the fierceness of the turgescency being in a due manner plainly depol'd by precipitation, the matter can easily afterwards be cast off either sensibly by stool, or Urine, or sweat, or insensibly, whence Nature recovers her strength again, which before was discomposed and oppressed: for the Humours themselves, as such, are not always the causes of diseases, but some malignant ferment in them and naughty disposition of the Humours which even in a very little quantity has great vertue; and if this ferment be extinguished, and this quality removed, the diseases cease. For we think that all progress almost of diseases is owing to some vicious rise of ferments: for these either springing in the *viscera* appointed for chylification and sanguification, or being carried to the whole mass of Blood and other parts under the cover and shew of aliments, what tragedies do they raise! what Stirs! but now the extinguishing of these presently in the bud gives a joyful hope of health. Apoplexies, Epilepsies, want of appetite, crudities, &c. proceed from the corrupt ferments of the digestions; and when the mass of Blood is sometimes too much exalted, boils in the

Vessels, and Fevers of divers kinds and natures are kindled thence, this sometimes proceeds from febrile ferments; but sometimes the febrile ferments themselves are the products of a spontaneous effervescence of the Blood.

The reason why an acetous and fowry disposition is often induced on the Blood (such as is in the Scorbutical, Hydropical, Cachectical, and those that labour of other Chronical diseases) is the acid and Saline nature of the ferments; and in the destroying of these consists the whole reason of the cure; whilst these last, the diseases continue; and because of these, Purgings and Bleeding only are to no purpose, for the Patients are macerated with purgers, unless these be chiefly taken away in the first place. For it is always better, says Sennertus, that vitious Humours should not be generated, than that they should be evacuated when generated. Thus (for example) in the cure of all Fevers, before all things the febrile ferments, (the next cause of the ebullition in the mass of Blood) as most urging, are to be fixt and precipitated by Specifick antipyreticks, Diureticks and Diaphoreticks that imitate Nature, which having extinguished the febrile ferments may afterwards withal resolve the vitious matter produced by them, and having resolved it, may separate it from the mass of Blood by convenient wayes: and when at length the febrile ebullition of the Blood is allayed and the paroxysm banished, then the occasional febrile cause is by a methodical cure to be removed by purgers, and a relapse to be prevented. The Method is the same in Chronical diseases; which although they have taken firm and strong rooting in the Body, with obstructions of the *viscera* from serous crudities every where collected, and the balsamick saltiness of the Blood turn'd into acetous and fowry, yet are to be cured by precipitating Alteratives, which may tame the Humours tainted with morbifick ferments, may resolve them, and the dyscrasie of the Blood being amended and the obstructions of the *Viscera* unlocked, may consume and cast them out.

Now Alterative Medicines do perform this precipitation either in a privative or a positive manner. Of the former sort are those, which not only make a fixt of a volatile, and a volatile of a fixt, but also of an acid a sweet, of a bitter a Salt, of a Salt a bitter; yea and also by imbibing the preternatural and acrimonious Salts, cleanse the Blood, and correct the depraved ferments of the *Viscera*, and so stop the preternatural fermentation of the Humours. Such kind of Medicines are resoluble, hungry and thirsty, easily imbibing acid corrosive Salts, and when they are filled and have done their business, depart; and they act partly by way of Alteration acquired in a possibility of their own, partly by changing the internal qualities of those, and such as descend from the specifical quality.

How this is done, the more intimate Skill of Spagiricks demonstrates: for he that understands the dulcification of Salts thoroughly, knows very well the reason of this also. For the Alterations that happen in the vital oeconomy from vital principles, depend not on the fire or cold of the Body; heat and cold are accidents not belonging to the nature of Diseases. Thus a Thorn being prick't into any part, in an instant there follows pain, to the pain succeeds the pulse, from the pulse an afflux of Blood, whence ensues heat, a tumour, an aposteme, &c. the thorn therefore moves the other things after it: Now the metaphorical thorn of Diseases is the strange ferment conceived in the *Archeus*, or other foreign acids, ponticks, corrosives, &c. which if the *Archeus* drive or deposit into the mass of Blood, what disturbance is thereby raised! So in the Liver there are often felt preternatural heats, but all these are caused by means of the wild acid Salts, which ascend the *Archeus*, &c. says Helmont, lib. potest. medicam. §. 20.

Seeing

Seeing every thing acts not upon every thing, but upon something determinate, nor every thing suffers not from every thing, but from something determinate; so also every Morbifick matter being furnished with its own peculiar Ferment, cannot indifferently be dissolved and precipitated by any one, but only by its own appropriate precipitating Medicine. For it is not enough that attenuating Remedies be opposed to thick and viscid humours, and incrassating to thin; but their Nature also according to the diversity of the figure of their Parts with their specifick Ferments is to be heeded, and specifick and proper precipitating Remedies are to be used, Alkali's for Acids, Acids for Alkali's, Sulphureous for Sulphureous, &c. Whence *Walaus* says, that *Alteration is made by Conjunction and Perfection: Hence if altering Medicines ought to alter, they must needs be mixed with the humours that are to be alter'd; if they would be mixed thoroughly, they must be like the humours, not in respect of their qualities, for so they should be contrary, but in respect of their Constitution: Therefore what things are oily in our Body, let those be alter'd with oily Medicines, what are watery with watery, what are acid with Alkali's, what are Alkalizate with Acids, &c.*

When thick, viscid and acid humours produced from the vicious Ferment of the Stomach; or from the depravation or corruption of the Chyle; stick close in the coats of the Stomach, then those Remedies are to be opposed to them, either that abound with a volatile aromatick Salt, such as is in Wormwood, Aron root, Centaury, *Cardus Benedictus*, &c. or that are endued with an Alkaline fixt Salt, or a volatile lixivious, such as are the Salts of Wormwood, Ash, Succory, the volatile Salt of Hartshorn, the volatile Salt of Tartar, &c. As also if this acid Crudity be after a sort volatile, and exalted by a fermental humour; so that it penetrate even into the mass of Blood, it is fixed and changed not only by all fixt Alkaline lixivial Salts prepared from Plants, but also if there be need of greater penetration, by other alkaline volatile Salts, such as the salt spirit of Sal Armoniack, of man's Blood, of Hartshorn, &c. with which effervescing it is in some measure temper'd, coagulated and made neutre. Moreover for this purpose serve also Crabs Eyes, red and white Coral prepared, *Spodium*, Mother of Perle, Perch-Stones, &c. all whose alteration is of a middle sort betwixt the stronger effervescence that arises from the aforesaid Salts, and the concentration or fixation made with the aforesaid Alkali's.

If the Ferment of the Stomach be filled altogether with sulphureous and bitter Excrements; so that it efflate too much thereby, and a nidorous crudity spring thence, acids are to be given, of which sort are *spiritus vitrioli Martis*, *salis striatus*, &c. the juice of Citron, Pomegranat, Corinths, Berberies, &c.

To correct a lixivial Alkali abounding in the first ways, whereby driness of the mouth and thirst is too much encreased, acids also being taken are profitable: also Emulsions made of the four cold Seeds. (See the Title of *Sitis*, Thirst.)

Where the Ferment of the Stomach is very weak, or departs too much from its acid Salt volatil Balsam, those things are to be given that supply its place, such as are volatil acido saline Salts, volatil acid Spirits; of which number are the fixed Salt of Hartshorn prepared with the Spirit of Salt, or the *terra foliata* of Tartar, *D. Mabius's* aperitive tincture, *Arcanum duplicatum*, &c. For these are the genuine wakeners or excitors of the Ferment of the Stomach and of the other *Viscera*; they do withal cleanse away the filth of all the Digestions, resist Putrefaction, unlock long-continued Obstructions of the *Viscera*, and exterminate from the vital jurisdiction divers inveterate kinds of Fevers, and other Diseases that arise from thence.

The defect of the fellous Ferment is made up

by bitter things, as Wormwood, Centaury, Agri-mony, *Card. Ben.* Fumitory, and the roots of Succory and other Aromatick bitter ones: Its excess is corrected by the acids reckoned up above: For the Fermentation of the bile, unless it be in a right state, gives occasion to divers Calamities in the windings of the Guts.

When the Sulphureous part is sometimes exalted in the mass of Blood from a febrile Ferment, and is too luxuriant; and the *Crafts* of the Blood perverted from its due state, so that it is all in a flame, hot and boiling, then that febrile Ferment, as the most urgent, is first to be destroyed by precipitation: which is done in intermitting Fevers by tartareous Medicines, by lixivial Martials married to acid Spirits; in continual, by *Bezoardicum f.* and c. of Gold and Steel, which do wonderfully bridle the ebullition of the Blood; whose vertue arises not only from the Antimony and *Mars* and *Sol*, but also from the Spirit of Nitre, which is fixt abundantly in these (which the increase of the weight teacheth) its refrigerating and Anodyne vertue remaining safe (which is known to few) which yet is made more apparent when all the Nitre is turn'd into a most white Earth, by the operation declared by *Helmont*. *Poterius's Alexipyretion* that springs from the same Fountain, is no less powerful. Now the cause of that ebullition is a febrile and poisonous Ferment; which being removed, the Disease is most quickly and safely banished: But this is done neither by Purgers, nor by Bleeding (which two are Impairers of the Faculties) but by specifick anti-febrile Remedies (that fix the febrile matter,) by Diaphoretics and Diuretics: to which if specifick Alexeteries be assisting, you have a true Alexipharmack not only of all malignant Fevers, but also of the very Plague it self. In the mean time the febrile *assus* or fervour is to be demulced with the acid Spirits of *Mars*, *tin-ctura Bezoardica*, Gelly of Hartshorn and Ivory, with the Juices of Pomegranats, Corinths, &c. the tinctures of Roses, Violets, and Borage, prepared with the Philosophick Spirit of Vitriol and a little of the Spirit of Raspberries, &c.

When the saline Parts in the Blood, through bad digestion and fermentation are not spirituous enough nor are rightly exalted, but remain crude and fixt, are at their own liberty and suffer a *fluor*, the Blood not only becomes thick and unfit for Circulation, but acid also, austere and acrimonious, so that it is thereby corrupted, and being coagulated breeds Obstructions in the *Viscera*, and tartareous crudities are every where heaped up, from which proceed the Hypochondriacal Distemper, the Scurvy, running and fixed Gout, Stone, Dropsie, Leprosie, and most Chronical Diseases. In this vicious disposition those Medicines are good which exalt and volatilize what is fixt, and promote an insatiation in the whole mass of Blood. In this case Evacuators profit nothing at all, but by depauperating the Blood more, waste the faculties without remedying: those Medicines avail more that are fill'd with a temperate and mild volatil Alkali, such as Stone-crop, Fumitory, Germander, Centaury, Celandine, Scurvigrass; and the more penetrating, as the salt Spirit of Sal Armoniack, of Hartshorn, Soot, Man's Blood, Hart's Blood, the volatil Salt of Tartar, *Arcanum tartari* with the volatil Salt of Vipers, &c. respect being had to the circumstances, are of notable use. Hither also are to be referr'd Decoctions of Roots and Herbs impregnated with a volatil lixivial Salt; so that the more excellent these are in this degree, the more easily and plentifully also do they correct the preternatural acidities in our Body. Preparations of Steel and Tartar give great hope of Health here also: for these, besides that in the Stomach, the Fountain of Digestion and

Archive of Life, they correct and prepare the said

T t t t

said Acidities, which otherwise might be hostile in the habit of the Body; they also imbibe and precipitate the wild Salts in the Blood, and withal unlock the Vessels that are here and there obstructed.

Precipitating Medicines work after a *Positive manner*, while they are spirituous and have a singular Balsamick vertue; by the benefit whereof they so strengthen the power of the Natural Ferments, and their innate Balsamick saltnefs, that Nature her self can now again rise up against the Crudities, and digest, or precipitate or separate them. After this manner ought the universal Remedy to operate if any had it: or for want of it, other comforting Spirits reduced to the greatest volatility.

Maurit. Hof-
man, Meth.
Med. lib. I.
c. 19.

Anodynes, Narcoticks.

(See *Hypnoticks*.)

The Contents.

Some Anodynes are external, some internal. I.
The external act either by mollifying, II.
Or by hindring an afflux of humours, III.
Or by Digesting. IV.
Nervine Anodynes. V.
The same agree not to all Parts. VI.
Opium is better inwardly than outwardly. VII.
How Narcoticks take away the sense of the Part. VIII.
How they take away Pains. IX.
Anodynes and Narcoticks differ only in degree. X.
Some Anodynes are not alike Narcotick. XI.
The vertue of Narcoticks depends on the Sulphur. XII.
Opium is a notable Anodyne. XIII.
How it eases Pains. XIV.
It stops Fluxes of the Serum and Blood. XV.
It is convenient for thin humours, not thick. XVI.
It is not to be given where there wants Serum. XVII.
In Malignant Diseases it is to be joyned with Bezoar-
dicks. Ibid.
Opium is the best Sudorifick. XVIII.
Let it be given in a due Dose. XIX.
The internal use is often better than the external. XX.
Let not the Patient be very weak when he takes it. XXI.
Cold things being applied are an effectual Anodyne. XXII.
The Preparation of the Oil of yolks of Eggs and Almonds.
XXIII.

I. **T**hat we may the better proceed in rehearsing these, it is necessary to premise a distinction betwixt internal and external Anodynes; for according to the place of application, does their manner of working vary also: Both of them indeed loosen the tension and vellication of the Membranous Parts, but after a much differing manner.

II. For outwardly this is performed, 1. By *Emollients* (that are such as to their operation) whether they be *Mucilaginous* things, whence a cheap and familiar Poultice in all Pains is made of the crumb of white Bread, Milk, Saffron, the yolk of an Egg, &c. So live-Earth worms being applied do notably assuage the Pains both of a Whitlow, and also others of the Nervous Parts; on which account I have sometimes cured the greatest Pains of the Back only by bruising and applying these: Or watery *sepsids*, or hot and moist things; so Baths, Fomentations, and the like Topicks do loosen and digest by a kindly warmth, and so do egregiously demulce: So Hippocrates in a Pleurittick pain applied warm Milk in a Bladder to the aking side; for although the vertue of the Liquor cannot thoroughly

reach this Membrane, yet neither is there need of it, for it suffices that a kindly warmth may on this manner be continued for some while, and so affect and demulce for some continuance the pained part: Or fat things, all of which do this, unless something hinder their Application; so the common Anodyne Ointment consists of meer fats; so the yolks of Eggs are deservedly reckon'd among these Anodynes. I say all fats are good for this, and it is all one almost which you take, for there is hardly a farthing to chuse.

III. 2. By Medicines *repelling and hindring the afflux of humours*, which, as the former demulce, so do these dull the sense of the Part: Hither belong all that are actually and potentially cold, as for instance, Bartholin relates that the Colick was cured by applying ice, for the heat is thereby concentrated, and the consequent irritation and intension of the Pain remits.

Tract. de
Nive.

IV. 3. By *digesting Remedies*, which have a gentle vertue of heating and dissolving, and strengthen the Native heat, and procure the dissipation of the viscous matter through the opened Pores; and these are properly *Paregoricks*.

V. Hither belong (*in specie*) *Nervine Medicines*, which by their Balsamick vertue are grateful to the Brain, and demulce the Part, and take away the preternatural acrimony; whether they be *spirituous*; thus Pains are often driven away only by Brandy; or *urinous*; so Spirit of Sal Armoniack either by it self or with Spirit of Wine eases Pains; so the Spirit of Hartshorn, the volatil Spirit of Earth-worms and the like, do greatly assuage Pains of the Nervous or Membranous Parts; or *mixts*, such as our renowned Nervine Liniment of *Aqua Magnanimitatis*, the volatil Spirit of Earth-worms, and of Hartshorn or Armoniack conjunctly. And these indeed are good in Pains of all sorts, yet not after one manner, nor for all Parts.

VI. Thus the spirituous and digesting, the less fat, and the middle sort of Emollients are more profitable to the membranous Parts and Joynts: So Emollients are more convenient, where the ways are to be loosened withal, as in the Stone, and in Inflammations that tend to Suppuration; digesting and spirituous where we would discuss more: So Repellers are more convenient in safe and dry places, as the Head; but less, in the soft and moist, as the Breasts. Seeing therefore there is a great latitude of these, Anodynes are to be discriminated well, and varied according to the nature of the Parts and Diseases, in which very thing a Physician differs from Mountebanks and the vulgar, who whilst they would do good, do a great deal more hurt. But we must note for the Explication of these things,

VII. That *Opium* is more convenient inwardly than outwardly; not but that it may be applied this latter way, but because it chiefly respects the cause, it is generally used the former: And if it be used as a Topick, it acts no otherwise than by demulcing, digesting and mollifying, and by communicating part of its *Effluvia* to the Blood: but the rest that we have reckoned up are rather applied outwardly.

VIII. Narcoticks (except the actually cold) being applied outwardly, take not away the sense of the Part; they repel not, but discuss, mollifie and digest; for that hypothesis of the Ancients was false, that determin'd Narcoticks to be cold, and that by the application of them the sense of the Part is intercepted, taken away and dies: which is against Experience; for *Opium* being applied and worn for twenty four hours or more, is so far from taking away the sense, that it rather mollifies. Hence Henbane being boiled with Milk does greatly assuage scorbutical Pains, but it does it chiefly with its mollifying and digesting vertue; in like manner we have seen a Plaster of Henbane very much to help

help Pains, to discuss, and promote Suppuration as there was occasion. There is the same reason of Hemlock; whence it is vainly objected by some, that the use of the Plaster of Hemlock is not safe in a *Scirrhus* of the Spleen, because it rather congeles. Therefore that Hypothesis is to be turn'd out of the Medical Court; and yet it is not to be denied that a Sulphur, which they call Narcotick, is found in these very Medicines, which is communicated to the Blood partly even in outward application.

IX. External Narcoticks and Anodynes that assuage Pain, do also by accident procure sleep; but (except those of Poppy) they are not equally used for procuring sleep: but Opiats do both. For where Pains cause watchings, when those are removed, these also by the same means are taken away: But it is unlawful to give Hemlock, Henbane, or Mandrake inwardly; for they contain a Sulphur that is impure, indigested, inimical to Nature, not kindly. Now to internal.

X. Anodynes and Narcoticks differ only in degree; but neither all Anodynes nor all Narcoticks are Hypnoticks: For the binding of the sense, which is properly called *Narcosis* or stupefaction, if it be meant of inward Medicines, is owing to the binding of the Animal Spirits, so that they do not flow into the Parts, but are detained by a Narcotick vapour as by a band; so that internal Anodynes by increasing the Dose may be made Narcoticks; and on the contrary.

XI. Yet there are some Anodynes that are not equally Narcoticks; such as do indeed mitigate the acrimony of the Humours, and take away the Pains that depend thereupon, and by accident also sometimes procure sleep; but they cause not sleep by a primary intention, as for instance the Anodyne Sulphurs (commonly called Narcotick) of Metals and Minerals, such as lodges in native Cinnabar, of which I have seen some notable Effects, that the aking of the Teeth, Head and other Nervous Parts has been stopped thereby, whence Cinnabarines are good in all great Pains, as taking away the tension and twitching of the *genus membranosum*; and absorbing and precipitating the acrimony if there be any, and so they are most convenient in the Gout, Pleurisy, Stone, &c.

XII. That the manner of the action of somniferous Medicines in specie, or of these Narcoticks in general, and especially of Opiats may appear the more clearly, we say that it consists not in a Salt, nor a Mercury; but in a Sulphur, and that 1. indeed kindly, and 2. easily resolvable: I say in a Sulphur; which is clear in the Inflammability, fatness, smell, &c. of Opium, Saffron and the like; also from the Oil which it is easy to draw from them by Distillation; and that kindly, that we may remove all those from internal use that are not endued with such an one, but an immature, indigested, fetid one, or one that is inimical to Nature; notwithstanding that these very things by this very Sulphur are apt to induce sleep, yea death; and easily resolvable both in it self, and also in respect to the Body: In it self, inasmuch as such Medicines have withal either a volatil Salt, as Opium, Saffron, whence arises their resolution in the Stomach, or Exhalation, and their quicker evaporation, and easier communication to the Blood; or a watry vehicle, as Emulsions, Brandy; for it is very well known, that by these two chiefly is Sulphur unlocked, expanded and resolved, and consequently gains its activity, &c.

XIII. None of the Anodynes is more famous than Opium, this is the first and last of all, with which alone the Physician may be content, if he know how to use it; whence with good reason Willis hath asserted that Medicine cannot want it: Sylvius was wont to say, he had rather be no Physician than want Opium; and Platerus said once by

Hyperbole, that though a man were broken on the Wheel he could by his Opium preserve his life, meaning that there is no Pain as it were which gives not place to it.

XIV. Opium assuages Pains not palliatively; but truly. Some Physicians are too scrupulous in this case, who always cry, the Cause; the Cause is to be taken away, and that it is contrary to Method; to seek to remedy the Symptom of Pain by Opiats; that will last but a little while: For indeed Opium does greatly demulce the acrimony of the Humours, and keep the Morbifick matter in the centre as it were, and grants rest to Nature: whence the reason why it does not allay Pain alwayes alike and thoroughly, is not to be ascribed so much to the Medicine as to the plenty and acrimony of the Morbifick matter, which we must help by other hypnotick Remedies also.

XV. Nothing cures Fluxions of the Serum and Blood so well as Opium: Hence in Hemorrhagies of the Nose or Womb, Spitting of Blood, Loosness, Bloody Flux, Catarrhal Fever, it incrassates and concocts, it moderates and bridles, so that the violence of the rushing Humours is stopt as it were and tied. Nor hinders it that Opium is hot, seeing this very thing is not to be ascribed to the first qualities, but to the manner of mixture.

XVI. But as it is more convenient for thin, volatile, watry, acrimonious and fluxile Humours, so is it less convenient for thick, viscid, flegmatick and fixed; for it fixes and incrassates these more; whence in a confirm'd Dropse Opiats are very hurtful, and Death comes on the sooner by this means, for the plenty is greater, the resatiation greater: whence we must note also in general, wheresoever there is great plenty and resatiation of Humours, there Opiats do more harm than good, for they bridle their motion the more, and make them not fluxile: hence in Diseases of the Breast, if a greater plenty of Humours obstruct the Pipes of the Lungs, and require to be expectorated, as in the Pleurisy, Asthma, &c. Opiats promote the Suffocation: the same holds in a Cough, Pains of the Stomach and others.

XVII. Whensoever Serum is wanting, Opium is either not to be given at all, or not but with Moisteners; nor in malignant Diseases; but with Bezoardicks: hence it is used in vain to procure sleep in old Men: (See tit. of Hypnoticks.) But in all malignant Diseases, when the Pain is more vehement or the Flux greater, it operates safely and pleasantly alone: but when there is only want of sleep, it is fitly joyned with Emulsions and other Bezoardicks. Yet it self is not the meanest among Alexipharmacks, as may appear by Treacle, *Diastordium*, and almost all other Antidotes; whence also liquid Antidotes, Bezoardick Tinctures and Mixtures are fitly compounded with Anodynes, only diminishing the Dose.

XVIII. Opium is an excellent Sudorifick: We have hardly any Diaphoretick so certain, so faithful and as it were so properly called so, as Opium; yea (which are the words of *Walsus*, *m. m.* Pag. 61.) the reason why Treacle or Mithridate move Sweat, is wholly from the Opium that is mixt with them: I have tryed (adds he) these two Electuaries prepared without Opium, and they have not caused Sweat at all. Whence it does not only increase the vertue of Sudorificks when it is mixed with them as aforesaid, but also being given by it self alone, it for the most part procures a gentle and dewy Sweat: So that from all these things it is clear, that in the use of Opiats the greatest respect is to be had to the Serum, that the Sulphur of the same may be resolved and deduced into act.

XIX. It is better to fail than to exceed in the Dose; but to keep the mean is safest in our practice: We have noted that two Distinctions are necessary about the giving of Opium: 1. Between the ordinary and extraordinary Dose: Opium being left to it self, and not

increased in bulk by the unnecessary addition of superfluous Ingredients, may fitly be given ordinarily from a third or fourth part of a Grain, to one, two or three Grains; and in this manner it does its office very well, if so be the degree also of the Indicant and Prohibent be diligently heeded. But when Pains are very urgent, and the quality of the Blood is very acrimonious, &c. Custom and the like circumstances varying, one may ascend higher, which extraordinaries make not a rule. 2. *Between the first and secondary intention*: So if we would only stop Pain, watchings or urgent Fluxions, there is need of the larger Dose; if we joyn other Medicines to it that are moistening, adstringing, absorbing, febrifuges before the Fit, &c. it is given in a smaller Dose, as but half or a third part. The first intention is to be answered ordinarily about Night, and but seldom; the secondary at other times, and oftener.

XX. It is often better to use it inwardly even for an external Malady: for that is the nearest way to actuate it; whereas to apply it outwardly is about, and less safe or faithful: Thus in Pains of the Teeth it is often better to swallow an Opiate Pill, than to apply it to the Tooth it self; though I do not so readily believe that some have died by the use of it this way, as Authors relate. So it is better to omit *Opium* in Clysters, especially seeing all Clysters are foreign to the Guts, nor does the acrimony of the Humours or the Pain equally abate this way, an Error that has sprung from a false Hypothesis of the activity of *Opium*: Otherwise it is used safely indeed in Plasters and Ointments, but there the reason of its working is far other, as was said above.

XXI. Opiats are not good when the Patients are very weak: They profit indeed the weary, and the pained, and refresh the weak; but if their weakness be in the highest degree, they do not do so: so if they be given when Death is at hand, they hasten it the more. So neither must they be given when Labour in Childbirth draws on, for that Pain is rather to be promoted than stopped, although for another reason they may be given. So particularly they are to be administered more warily in weakness of the Stomach: But then this is to be understood of the primary Dose, not of the curtail'd; which being observed, the Faculties may far more easily be restor'd and recover'd by renewing sleep, allwaging Pain, and checking the impetus of the Humours: On the contrary if when the Spirits are exhausted and spent, the remainder be tyed, Death ensues presently.

XXII. For easing the greatest Pains, where digesting Anodynes being first applied have done no good, let the pained Part be hastily touched with a Bladder full of cold Water, and let the Bladder be removed again without delay, and repeat this twice or thrice: this is the advice of *Hippocrates* and *Sanctorius*: for a moderate torpor has a virtue to cure Pain: and then the application is made more conveniently in a Bladder, because the pained Member is not offended by the moisture, which perhaps might do it harm.

XXIII. Oil of yolks of Eggs and of sweet Almonds is not to be drawn out of the yolks or Almonds burnt (which some Perfume-makers do, that they may draw the Oil more easily and plentifully) but they are only to be gently warmed, and then the Oil to be drawn out of them with that diligence that is necessary: For indeed by burning of them, the Oil is easily drawn, but then it is sordid, stinking, and very unfit to allay Pain.

Aperients, or Openers.

(See Obstructions, Book 13. and Preparers below.)

The Contents.

- Volatil Aperients should be moderately thick. I.
Absorbing and Resolving Aperients. II. XI.
The Universal Indicant of Apertion is, 1. An Obstruction, III.
Viz. (1.) An Obstruction of the Viscera; IV.
(2.) An Obstruction of the Vessels; V.
(3.) An Obstruction of the Passages: VI.
2. A Concrete or tartareous Body indicates Aperients. VII.
Humours and Wind are subject to concretion. VIII.
3. A thick, viscid, clammy Body indicates Aperients. IX.
Thick Humours often lie hid, although the Symptoms of them be most urgent. X.
4. An acid, acrimonious, sower Body indicates Openers: and on what the virtue of Steel Medicines depends. XI.
Purgers are Openers: and we must use these by turns. XII.
What degree of heat Aperients are endued withal. XIII.
Their active Principles. XIV.
All Diareticks are Aperients. XV.
Let Universal Remedies precede the use of them. XVI.
We must not insist too much on them, especially on the volatile. XVII.
Medicines that respect the Part are to be mixed with them. XVIII.
They are not to be mixed with our Meat. XIX.
We must take heed they dry not too much. XX.
Stirring about is necessary upon taking Chalybeates. XXI.

I. A Perient, resolving, attenuating, inciding, and absorbing Medicines, all serve the same end, for some of them only express the manner of acting more: Their virtue namely and manner of acting consists principally in the thinness of their Parts: Aperients are endued with Particles that incide, are acute, penetrate and loosen the Passages, whereby they procure Motion to fixed Humours, and make way for themselves to pass by. But secondarily they ought to have a moderate thickness, that their virtue may not so soon expire or dissipate, which that of Rarefiers does, which are more proper for what sticks in the Surface and Pores, for they loosen the Pores and fuse the Humours: Hence bitter things are of great esteem among Aperients, because through their earthy Parts they strengthen withal: For it stands for a rule, That those Aperients are the best, which strengthen the Parts and Fibres withal, and do not induce a loose tone.

II. And these are the Aperients properly so called, or rather of the first class, namely of the volatile. But besides these there are others that absorb and resolve, not as if they were endued with thin Particles, and so penetrated by their own virtue, but because they absorb or drink up the coagulum that fixes the Humours as it were, and for the most part is an acid, pontick and sower quality, whence the Humours are sweetened as it were, and consequently do not restagnate in their Receptacles or Channels, but pass readily to and again, and are either circulated or cast out.

III. The Universal and as it were common Indicant therefore of Apertion (I mean common to the Vessels and Pores obstructed, and to the matter obstructing) is 1. Somewhat obstructed; and so hence Aperients, in a great latitude, are

are convenient for all obstructions in general: For example, for an obstruction

IV. (1.) Of the *Viscera*, as of the Liver, Womb, Kidneys, Spleen, Mesentery: where it is to be noted that those *viscera* are more liable to obstructions that have many vessels, as the Liver and Spleen especially.

V. (2.) Of the *Vessels*, as of the *Veins* and *Arteries*, which are like pipes or channels: Whence as, otherwise, waters in pipes do by little and little deposit that slimy matter wherewith they abound, in the pipes they pass through, and fix it to their sides: so it is in the *Vessels*; whence we see that those whose *Vessels* are obstructed have their pulse increased, and that the Blood is moved the quicker, because the space it moves in is narrower. Also for obstruction of the *Nerves*, as in the Palsie, where those *Nervine* Aperients are fitting, that open the obstructed pores of the *Nerves*: Also of the *salival* and *lymphatick* *Vessels*, &c.

VI. (3.) Of the *meatus* or *passages*, as that of the Gall, of the Intestines, of the Ureters, &c. whence they are proper in the Jaundice, Colick, Stone, &c. where we must note by the way, That all Persons troubled with the Stone are also Hypochondriacal, or abound with a tartareous or obstructing matter in their Blood.

VII. 2. Somewhat concreted or tartareous does indicate Aperients, when saline, tartareous and earthy Humours cause obstructions, in which case they are properly called *Resolvents*: Whence in the Stone, Scurvy, or the Hypochondriacal affection they are the only Remedies; whether the concretion and coagulation be *in fieri* (or but a growing) whence in clodding of the Blood, palpitation of the heart, Swooning, Fainting, a *polypus* of the Heart, &c. they are good: or *in facto* (when it is completed) as in inward Abscesses, Pleurisie, Apostem of the Liver, &c. also in a fall from some high place, and in Wounds inwardly; whence most Antipleuritics and Antitraumaticks are withal *Resolvents*, and in a Pleurisie the same things are convenient as in a fall from on high: so also these *Resolvents* on this account are good in spitting of Blood, if they be join'd with *Astringents*.

VIII. Now subject to this sort of concretion are either *Humours*, viz. Blood, Choler, Serum, Urine, Milk, whensoever they restagnate, and are moved without their proper sphere as I may say, or are out of their Element: or *flatus* or wind; whence *Resolvents* are also very good in flatulent Distempers.

IX. Aperients are indicated 3. by somewhat thick, viscid and clammy, whether that be meant of the bile, when it becomes sluggish, puts off its proper nature, and loses its salino-Sulphureous, kindly and balsamick acrimony; or of phlegmatick, cold and moist juices; whence in an *Anasarca*, thick Catarrhs, ill habit, glutinous stone, the Stomach fill'd with Phlegm, &c. they are good; in which case they are particularly called *Attenuators* and *Inciders*.

X. Now although thin Humours also may often seem to offend in obstructions, as in the Scurvy and Hypochondriacal affection, yet they are thick privately and in their retirement; and besides the Saline volatile Parts there are also others; whence the Symptoms vary widely: thus Serum or Lympha, so long as it is in its own Sphere and under the dominion of the Natural heat, appears thin, but when it slides out of the Vessels or out of the Body, it waxes thick, as is seen in Catarrhs. Thus Aperients of this sort, especially volatil, are good in the Apoplexy, when the original of the Nerves is obstructed: also in stoppages of the Nostrils, in intermitting Fevers or Agues, in straitness of breath, &c. And in this case Purgers also are excellent, seeing all of them have a saline melting Spur in them.

XI. Aperients are indicated 4. by somewhat acid, acrimonious, austere, sour, pontick, when namely, the Blood is fixed as it were by a preternatural acid, when the juices are constringed by austere particles, so that the Blood circulates not orderly, nor its volatile Parts meet and part freely. And in this case they are commonly called absorbing, saturating and precipitating Medicines: Whence also appears their very large use; as for instance, in vertiginous Distempers of the Head, in the Epilepsie, Apoplexy, Palsie, opening and absorbing Cephalick Cinnabarines are good, especially those that make the Blood fluxil, and for this very vertue are very comprehensive; they are also profitable in Diseases of the Joynts, Hip, Womb: also volatil Salts, both alone, and also when made more oily: So in Diseases of the Liver and Spleen, yellow and black Jaundice, Scurbus, Dropsie, ill habit, and especially in the Hypochondriacal affection and Scurvy, the same Medicines do the business. For if it be asked, How Medicines of Steel act, and open? 'tis very well answer'd, By absorbing, just as Spirit of Vitriol, Nitre, Salt, or aqua fortis it self being poured on Steel have their acid particles infringed, are saturated, grow sweet and turn to Vitriol: for thus it is in the Body; whence Corals also are commended by Glauber as an excellent Medicine in the Hypochondriacal affection, taken to a scruple or half a drachm; Thus the same are good not only in these affections, but also in the Nephritick.

XII. And these very Aperients consider'd generally act two wayes, 1. by altering, so that they correct the offending matter it self, and re-establish the ducts, passages and vessels; 2. by evacuating, in which regard Purgers also themselves are excellent Aperients, for they also are indued with subtilty or thinness. Hence is the practical rule, In obstructions of the viscera we must not only open, or not insist upon Aperients only, but must also evacuate, that that which is opened may be evacuated. And in chronical Distempers these are to be used by turns, first we must open, then Purge, and then again continue Aperients: And this also is to be observed, that Aperients being added to Purgers encrease their vertue.

XIII. Now Aperients themselves are of divers kinds; and as Montanus and experience testifie, in general, most of them exceed not the second degree of heat, and they ought withal to be endued with a thick, strengthening, earthy substance, that their heat be not so soon dissipated.

XIV. In Aperients the active principles are predominant, especially a fixed Salt and the Mercurial principles; and aeral parts are mixt with the earthy; and they are (for instance) 1. *Acrimonious*, either with an aromack energy, or with the vertue of a volatile Salt, as the five opening roots, the roots of Burnet, Aron, Antiscorbutick plants, Mustard, the Arabian costus, &c. 2. *Aromack* and oleous volatils, as Menth, Pennyroyal, Cinamon, cubebs, costus, Mace, carminative Oils, volatil Salts, oleous, Antiscorbutick Spirits. 3. *Bitter*, as the roots of Cichory and Gentian, Worm-wood, Agrimony, German-der, Gum Ammoniack, Aloes, &c. 4. *Acid*, as pickled capers, the volatil Spirit of Salt, of Nitre, of Tartar, the Glyssus of Antimony, which penetrate notably; the juice of Citron, the Cream and Crystal of Tartar, mineral waters call'd acidule. 5. *Watery*, which dilute, temper and yield a vehicle, Whey, distilled waters. 6. *Absorbing*, fixed and lixivial, as the Salts of plants, the Tincture of Tartar, which cleanse notably, and purge the filth out of the veins: Also earthy, whether alkaline, as Ceterach, Liver-wort, Crabs-eyes, Corals, Tartar vitriolate; or vitriolate, as vitriol, vitriolum Martis, crocus Martis aperitive, the filings of Steel in substance; tinctures of Mars. In short the most select Remedies of them are comprehended under a quaternary number, and are either Martial, Tartareous, Vitriolate or Antimoniate.

XV. So

XV. So also all *Diureticks* are aperient, which are chiefly profitable when there is obstruction in the upper part of the Liver, and when the malady is throughly wedded to the Blood.

XVI. Now Aperients and Resolvents are more proper after *Universals*, for otherwise the Humours are rather fixed and driven further in, than the coats of the passages and vessels freed: hence both purgers are convenient and also Blood-letting, which is often very profitable in a great obstruction, if there be present also a fault in the Blood.

XVII. We must not insist only and continually on Aperients singly, especially volatil, but strengtheners are to be intermixed; otherwise the tone of the parts will be violated, and the Body will be precipitated to a bad habit: hence the hypochondriacal often use them in vain, if they neglect tonicks withal; and those mistake far more that by using volatil Spirits continually, strive to overcome obstructions by them only.

XVIII. There are to be mixt with Aperients such Medicines also as respect the part affected, that the native heat of the parts may be preserved; so Cephalicks are to be used for the head, &c. Thus as by the obstruction of the Kidneys a stone is bred, so Aperients are good for it, but such as dissolve the *coagulum* withal.

XIX. Let them be given on an empty Stomach, not with meat, nor presently after: for in general, aliments are not to be confounded with Medicines; and in particular, Aperitives, because they precipitate the chyme into the lacteal vessels and so increase the obstructions.

XX. Before all things we must see that they dry not too much, whence moistening or liquid Aperients dilute and temper more, and are greatly to be observed in diseases of the Liver, Womb, and Spleen. I have often observed the contumaciously Hypochondriacal, when they had been in vain long vexed with the stronger and drier Aperients, to become very well upon the use of moistening ones; whence Galenical Medicines are fitly mixed with Chymical: and hence Mineral Waters have their vertue, that they carry the dissolved Salts along with them. But Pills are fitter where the viscera do more abound with excrementitious Humours. To repeat these things summarily: *Aqueous* and *liquid Medicines* dilute and temper more; *earthy* absorb more; *saline* drive more by Urine; *acid* incide more; *acrimonious* attenuate and resolve more; *sweet* cleanse more; *bitter* do more strengthen withal.

G. W. We-
del. de C. m.
f. 43. 1

XXI. In all *chalybeate Medicines* this is alwayes to be observed, that after the taking of them the Body is to be exercised with walking about, that by this means the vertues of the Medicine may be better deduced into act: And that walking is to be continued for two hours: which being over, let the Patient take some broth wherein some opening Herbs and Roots have been boiled.

lib. 11. cap. 4.

Aphrodisiacks, or Increasers of Seed.

The Contents.

Aphrodisiacks do either encrease Seed substantially: I.
Or they stimulate (Opium is an *Aphrodisiack*) either inward-
ly, II.
Or outwardly, III.
Medicines that raise flatus provoke not Venery, IV.
How to be provoked in old Men, V.
Comforting and gently stimulating things are to be mixed with
Aphrodisiacks, VI.
They take away also impotency caused by Witchery, VII.

I. *Aphrodisiacks* are either 1. *strengtheners* or *increasers* of Seed *substantially*, Spirituous restoratives and helpers of the native heat, aliments of good juice, of easie digestion, and of much nourishment. Of Medicines some may be referred hither that respect the slippery and frothy character of the Seed, as the root of Satyrion and other bulbous roots, Artichokes, Ambergrise; *Valleriola* commends Cocks stones. And these take place more in old Men, or in such as have weak and few Spirits, as in those that are recovering from Sickness: for as there concur to a fruitful coition both a spirituous, consistent, plentiful and as it were turgent seed, and also a vigour of the Genitals; so the Medicines already spoken of do chiefly satisfy the former requisite.

II. Or 2. *Stimulating*, (1.) *Inwardly*, such as by their heat and chiefly by their acrimonious oleous Salt make the Seed more turgid, spirituous and acrimonious, so that it causes the greater titillation and impetus, and on this account requires an exit; and such also as strengthen the Musculous Parts and serve erection. Such are [1] all *aromata* or spices, and *Balsamick*, *Sulphureous* and *aromatick* things that are of the same nature with these, Cardamoms, Cinnamon, Saffron, Cloves, &c. in particular all Pepper, hence *Solenander* (sect. 4. conf. 7.) gives half a drachm of Pepper with three ounces of Milk and half an ounce of Sugar. Yea *Opiats* themselves are to be referred hither, whether alone or made up into Pills with Musk and Ambergrise; for it is certain by experience that *Opium* is a most approved *Aphrodisiack*, and perhaps can do more than any other, and it is so much the more to be commended, in that it both strengthens and stimulates and hinders the dissolution of the Spirits. [2] *Oleous* and *Spirituous* things; for whatsoever things intend the natural heat or the volatil and Sulphureous Parts of the Blood, the same do also excite Venery, or at least do contribute something towards it, whence *aqua magnanimitatis* comes into this number: *Aqua vite* satyriated, *Aqua vite* of Matthioli, oil of Cinnamon, preparations with Ambergrise, Musk and Civet, *confectio Alkermes* complete, &c. operate this way. [3] Other *saline* and *acrimonious* things that are not aromatical; for as *Venus* is said to be born of the Salt Sea, so saline things do also notably stimulate: *Mercurialis* conf. 48. l. 1. commends *Borax*. Likewise such things as are indued with a very biting Salt, that may be melted into the genital Parts, stimulate strongly: whence *Cantharides* are the strongest amongst these stimulators: so Purgers themselves become aphrodisiack upon the account of this very stimulus: (See *Platerus* lib. *Observat.*) for by the acrimony of the Medicine the seminal vessels may be easily irritated through their vicinity. Or [4] things of a middle nature, for hither belong such as have not so plain an acrimony, and may be referred partly to the alimentary class and partly to the Medicamentous; for example, *boletus cervinus*, (which we have observed to be more dull) an Harts pizzle, the flesh of the Sea-skink: The Indian Chocolad deserves chiefly to be remembered, which both increases Seed and adds a stimulus.

III. (2) *Outwardly*, such as strengthen, heat and stimulate: for example, the express'd oil of Nutmeg, and the distilled oil of Mace, Cloves, &c. *Minsichtus* oil of pissmires, *Cantharides* being warily added. Some anoint the yard with Civet; *Solenander* used to anoint it with Goats gall, with good success, and so did *Schenkings*.

IV. It is commonly reported of *Aphrodisiacks*, that Flatus or wind is necessary to Venery: but though in Boys erection or distension of the Penis may seem from Flatus, and these may concur by accident, yet they cannot nor ought not to be reckoned among *Aphrodisiacks*; those things indeed that excite the Spirits stir up Venery, and so make the

the Seed turgid, but so do not those things that breed or excite wind.

V. Venery is not so much to be exstimulated in old men by peppered and acrimonious things, as the vital vertue to be supported by things that recruit the Body it self; for you shall in vain exstimulate that Seed which is not there: moreover in old men exstimulating Aphrodisiacks do often loosen the Belly, through the consent that is betwixt the Seed-Bladders and the intestins; so that unfortunate old-men-lovers do often upon the taking of such confortatives, with a ridiculous effect filthily beray both their bride and the bed.

VI. Things that strengthen and gently stimulate are fitly mixed with aphrodisiacks; namely so as that the Body be well pamp'rd with good cheer, and such Medicines be made use of as comfort the vital faculty, and yet have a gentle Stimulus withal: whence belongs hither *Electuar. diastyrion*: but we find two Remedies chiefly approved, the one more mild and restorative, viz. *Chocolad*; the other stronger, viz. the *rotulae confortantes* of *Minsicht*: We have observed that confortatives alone without stimulators, or these without those have not had the desired effect. But when we speak of stimulators, we mean those that are gentle; for those that improvidently use *Cantbarides*, are often affected with a strangury and an unspeakable heat of Urine, and a Bloody Urine, the Remedy and antidote whereof is milk and cooling emulsions.

VII. Aphrodisiacks take away also that impotency that is caused by Witchery: In this case indeed there may be exhibited such things as use otherwise to be commended against incantations, especially the essence of *St. John's-wort* taken with the essence of *Satyrion* a little before the Twilight; also other things, as many have been restored by pissing upon new Brooms, or through their wedding ring; the shavings of Goats-horn are good, and also the decoction of *Columbines*, according to *Hartman*, to wash the genitals withal. So we have observed it likewise to be taken away by pissing through the hole in a plank that has been made by beating out a knot in the Wood. But I may self have restored some bewitched and tied up in this manner by Aphrodisiacks alone, particularly by the stimulating *rotulae* of *Minsicht*, and *Chocolad* already commended.

G. W. Wewel, de f. m. fac. p. 220.

Arteriotomy, or opening of an Artery.

The Contents.

It may be safely done. I.

How it may be securely done. II.

What Arteries may be opened. III. IV.

Whether it may be done even to swooning. IV.

It is to be done where there is a Bone under the Artery. V.

Before an Artery be opened in the Head, we must see whether the fluxion be not by the subcutaneous vessels. VI.

Whether it be more effectual than opening of a Vein. VII.

If an Artery be cut with an hot Iron, let the falling of the Eschar be retarded. VIII.

I. Although this kind of Remedy is almost obsolete in these times of ours, yet it is a very powerful and profitable one, and void of all danger: for only by ligature the efflux of the Arterial Blood is hindered in the lesser Arteries; nor is the Plaster proposed by *Galen* necessary, viz. of bole Armene, Frankincense, Mastich and hares wool made up with the white of an Egg, which yet those may make use of for the greater safety; that are fearful of this opening. The Temporal Artery is

opened as in Phlebotomy, and six ounces of Blood may be taken that spurts out with violence: after which lay on presently your plagets, and let them remain tyed on for four days. By the use of this we have cured the fiercest *hemisrania* or Head-ach, and never found any danger in this opening of Arteries. ¶ In vain, says *Parvus*, has arteriotomy been suspected, as if there were danger that the Blood could not be stoppt, or the orifice healed up again, because of the hardness of the Artery and the continuallness of the pulse, and for fear of an aneurism: but this is the opinion of men that fear all things safe. For we must distinguish between the larger Arteries, which are to be shunn'd by the Physician for the aforesaid dangers; and the smaller, in the cutting whereof there is no fear of danger. Yea of a larger Artery *Galen* (*lib. de f. m. cap. 23*) says, that if it be quite cut through, it may be closed with a cicatrix without an aneurisma; and that doing so has often taken away the danger imminent from a flux of Blood: for it is clear that when it is wholly cut asunder both ends being pull'd back on each side, one retires upwards and the other downwards: and this happens indeed to the veins also, but moderately; but to the Arteries more than to the Veins. And of the difficulty of the coalition he saith thus in the same place: The Nature of an Artery does indeed plainly shew the difficulty of its hard coat's conglutination, yet the difficulty is not such as is altogether invincible: for it is not so dry and hard as a bone or gristle, yea it is far softer and more carnosus than these: and therefore there is less reason to despair of uniting it after it is cut, especially where it self is small, and the Body of the man whose it is, soft by nature.

Lazar. River. Pract. lib. 1. cap. 16.

II. The manner of Arteriotomy deliver'd by the Ancients is so severe and dangerous, that there is none of the Moderns but is displeased with it: yea it had been wholly cast out of the number of Remedies, if the pity and diligence of latter Physicians had not invented other wayes. Surgeons were wont to tie a string about the Neck; but seeing the straiter binding thereof is very troublesome, it is better to make this ligature under the Arm-holes: Let this be so strait that the jugular Veins and Carotid Arteries may manifest themselves, the one by its swelling, and the other by its beating: then press the arterie with your finger, a little lower down than you intend to open it; and having open'd it (which must be done with a slow but steady and strong hand) let it bleed as much as you desire: When the operation is over, sprinkle an adstringent powder upon the wound, then lay a folded linnen cloth upon it, and upon that a plate of Lead; tie both these on with a fit stay, and it will be healed up in five or six days.

Barbette Anat. Pract. c. 10.

III. What Arteries may be cut? The first is the Frontal, that runs along the middle of the fore-head, and is commonly divided into two above, but in the middle has one single notable trunk: this is frequently cut by the Egyptians in an inveterate Head-ach. The second is the Occipital or the Artery of the puppis, opposite to the former, by the Lambdoidal suture, and is opened in the same distempers with the former. Thirdly, the Temporal Arteries are very safely cut in most diseases of the Head: By my advice an implacable pain in the left side of the head was taken away by cutting of these. Fourthly, *Galen* mentions the opening of the Arteries behind the Ears (*lib. de cur. rat. per f. m. c. 22.*) and *Paulus lib. 6. c. 4.* commends it in the vertiginous and such as have a fluxion upon their eyes. But, says *Galen*, 3. de loc. aff. c. 8. it is manifest that all have not been cured by the benefit of this Remedy; for some Arteries that are larger than these ascend to the Brain from its basis through the plexus retiformis, by which 'tis probable such distemper has been caused, a vaporous and hot Spirit being carried through them and filling the Brain: And it may be also that an unequal intemperies of the Brain may produce such a Spirit. Fifthly, the opening of that Artery that runs betwixt the thumb and fore-finger, (that is famous for *Galen's* praises) is good in the pain of the hypochondres,

dres, there where the Liver is joyned to the diaphragm. *Septalius* (lib. 6. animadv. 171. and 172) calls it a most wholsom help in palpitation of the heart. *Alpinus* (lib. de medic. Egyptior. 2. cap. 12.) testifies that the Egyptians cured all the pains of the internal viscera by opening this Artery. Sixthly, the cutting of the Artery that is near the Ankle, is believed to help in the Sciatica. None dare on purpose cut an Artery near the Cubit: for although an Artery cut by chance by a Surgeon that should have open'd a Vein, was healed up again

*Gal. 5. Meth. Med. cap. 7.
Roffine. Met. Med. lib. 4. sect. 3. c. 2.

by * *Galen's* advice, yet the same Physician (lib. de cur. rat. per f. m. cap. 23.) judges such apertion to be dangerous for fear of a gangrene or an Aneurysm.
IV. Whether may we Bleed by an Artery even to swooning? We have *Aëtius* an alterer of the affirmative (*Tetrabib. 2. serm. 3. cap. 9. de arter. sect.*) *We must cut the Artery* (says he) *not aslant but a cross, even to the bone, and most exactly scrape the Membrane that cloaths the Skull, and let it bleed even to swooning; in such namely as are robust and in whom the pain is vehement; for thus you shall destroy the Symptom, &c.* *Galen* favours it also (*l. de cur. rat. per f. m. cap. ult.*) where he relates how upon the cutting of the Artery betwixt the thumb and fore-finger, the Blood issued out so abundantly, that it came to near a pound, which evacuation was followed by a sudden ceasing of the pain, by the letting out the very hot, thin and vaporous Arterial Blood. You will object, though many benefits follow the Bleeding by a vein even to swooning, we must not say that the same follow upon Arteriotomy; for the Arterial Blood that is very Spirituous and the fountain of heat, being drawn in a great quantity, without doubt there must great weakness follow: add to this that life will sooner fail, than any profit ensue from such evacuation. *I answer*: It is not necessary to an Arteriotomy that induces a deliquium, that much Blood be evacuated: for seeing it is Arterial, Spirituous, most hot and thin, if it pass out but even in a small quantity, it induces a fainting, which *Aëtius* presupposes as the limit of this evacuation: Life therefore will not fail before this evacuation happen. Nor do we deny that a too great evacuation does dissolve nature; but it is certain that the faculties are not so much debilitated in cutting small Arteries, in which there is not contained so elaborate and Spirituous a Blood: and though it were so, yet the Remedy is not to be condemned: for there is nothing which profits so greatly, that does not hurt in some regard.

Gal. 11. Meth. 11. Zac. Med. Princ. l. 1. Hist. 43.

V. Let Arteries be cut in the forehead, temples, occiput, hand, foot: other where not, unless they have a bone lie under them, that they may be safely prest for consolidation. And therefore in a lean Body an Artery being by chance cut in the Arm may be closed up again, if it be bound up betimes and with a strait bondage as it ought, for the avoiding of an aneurysm.

Riol. Enchir. Anat. l. 5. c. 6.

VI. Before we think of opening Arteries in the head for averting of fluxions, the experiment of *Al. Benedictus* will not be unprofitable, to apply to the shaved head those Medicines that restrain the impetus or deflux of the Humours, from the Eyebrows even to the crown: if hereupon the eyes begin to be dry, it appears that the eyes are watered by those Veins that lie under the Skin; but if they continue wet, it is manifest that the Humour flows to them under or within the bone. The mixture that we speak of for suspending the Rheum is such as this, Make a cataplasin of fine flower and the dust of Frankincense with the white of an Egg, adding coprose and Stone alume.

Idem libid.

VII. Arteriotomy, that was highly esteemed of by the Ancients, some of the Moderns practise, and mightily cry up its use: But, as far as has appeared to my observation, so famed a success has often been wanting to that operation. Nor is this

a wonder, because that reason on which the Ancients relied, blaming the Arterial Blood as more outrageous than the venal (and supposing it different from it) and therefore advising the letting of it out, does not hold at all: Nor indeed is there any other reason, why Blood being let out of an Artery near the pained place, should rather give ease than if it were let out of a Vein; nay rather on the contrary we may expect greater help from the opening of a Vein, because an Artery being emptied draws nothing from the part affected; whereas a Vein being opened draws Blood from all the neighbourhood instead of that which is let out, and often reforms and returns to the circulation Blood and other Humours collected near the nest of the disease. However that we may not depart too much from the Practice of the Ancients, attributing nothing to Arteriotomy, we grant that it may perhaps sometimes help, although not immediately and causally, but only consequentially and by accident; in as much, namely, as the ends of the Artery cut in two do coalesce, so that there is no passage for the Blood any longer that way; for hence, seeing a somewhat less quantity of Blood is conveyed to the part by the Arteries, and yet an equal portion is still carried back by the veins, it therefore sometimes happens that the fuel of the morbid matter is diminished, and its minera consumed by degrees: and for this reason this administration does often happily succeed in inflammations of the eyes. Moreover a practice not unlike this is used by Farriers for the curing of malignant Tumours in Horses-legs; namely they take hold of and bind the Artery whereby the matter flows to the part affected; in the mean time that which had already flow'd in is partly evaporated and partly reformed by the Veins. I have heard also that almost the same method was tried by our *Harvey* not without success for curing stumous and Scirrhus tumours in man's Body willis.

VIII. It is better to divide the Arteries with a red hot iron, for there is danger otherwise that the Bleeding cannot be stopt. Nor must we omit to mention that in this case, viz. in the burning of an Artery, Surgeons may not use those things that forthwith remove the Eschar (as in other burnings) till the holes of the Arteries be wholly closed up: for by Butter and other things that are used for this purpose the Eschar easily falls off before the closing up of the Arteries, and the Blood inevitably issues forth: we must take heed of this therefore as of a greater evil.

Mercat. de ind. Med. cap. 4.

Arthriticks, or Medicines for the Gout.

(See Arthritis, Book I.)

The Contents.

They respect either the Serum, I.

Or the Nerves, II.

Or the Pain, III.

The Tone of the Joints is to be preserved, IV.

We must at the same time provide for both the Joints and Viscera, V.

The Malady is often exasperated by Topicks, VI.

Whether Agrippa's Remedy, of bathing the pained Parts in sharp Vinegar, be to be imitated, VII.

When Emplasticks help, VIII.

I. Those Medicines are generally called here Arthritick, which are good both for the Gout and

and other Distempers of the Joints. Now seeing the Stone, Gout and Hypochondriacal affection are bred out of the same Egg as it were, and follow one another, it will be eade to discover the Nature of Arthriticks; for so both Nephriticks are Arthriticks, and Hypochondriacks are so also: The Hypochondres afford matter, the Kidneys coagulate it, the Joints receive it; whence the manner of their acting appears. *Arthriticks* namely respect, either 1. The *Serum*, which is to be supposed much depraved in the Gout and Distempers akin to it. Such are (1) *Universal evacuators and diverters* of it by Stool, Urine and the habit of the Body, without which we cannot successfully cure: Diaphoreticks are chiefly useful to the Arthritical, and are as it were their only helpers: (2) *Particular Alteratives*, as in respect of its quantity, such as lightly consume and dry it up, and so divert Defluxions; so China, &c. is commended; also in respect of its quality, either such as temper and dilute, (as watery and substantially moistening Medicines,) or such as invert, absorb and precipitate its saltness and acrimony. Namely all *Aperients* that respect the depuration of the *Viscera*, their *Chylification* and *Tone*, especially *Steel Remedies* and also *Antiscorbuticks* themselves, are profitable to the Arthritical; because these take away the antecedent and feeding Cause, viz. the acrimonious Salts, and procure the breeding of a Balsamick and sweet serum: Unless this be observed, it is in vain to think of curing the Arthritical, for herein does both their Preservation and Cure consist. Now these very Remedies are good both in the *Arthritis* or Joint-gout, the *Sciatica* or Hip-gout, the Feet-gout, the Hand-gout, and in catarrhal Defluxions and the like. (3) *Resolvents*, such as render the serum fluxile, the chief among which are Cinnabarines, that do greatly hinder coagulation, and both upon other occasions, and especially in this case make the serum fluxile. But these, as also *Mercurials* outwardly, are chiefly good in Pains of the Joints, and others that arise from the *Lues Venerea*, where *Emplass. de ranis* with Mercury benefiteth.

II. Or 2. the *Nerves*, whither we refer the *Membranes*, *Ligaments*, and *Fibres*, which namely suffer, are debilitated and irritated by the afflux of the offending Humours; and such are the same as are reckoned under *Cephalicks*, and so all *Cephalicks* are Arthriticks, because the Nerves have their Origine in the Head. But the Medicines that are as it were properly owing to the Joints, and come under the title of Arthriticks, are (1.) those which are endued with a Balsamick, oily, sweet and roscid Sulphur, so Germander, Ground-Pine, Rosemary, Sage and Gumms; whence belong hither *Galbanetum Paracelsi*, *Castor*, *Euphorbium*. Nor hinders it that all these are not indifferently agreeable to Arthriticks because of their heat: for if you consider the afflux of Humours and the heat arising thence, Germander and Ground-Pine are commonly only used for them in the first place especially in the fit: but whereas the Ligaments and Nerves are cold, hence in other cases the joints do also sometimes altogether require such things: And the same, besides the Gout, are good also for the Palsie, Atrophie, Wounds of the Joints and Nerves, and especially for the ferous ichor of Ulcers, which practical Experience teacheth ought not nor cannot be so well cured with Astringents, as with such as strengthen the Part, that its due nourishment may be actually communicated to it. *Contraction* also and *weakness of the Parts* from Wounds, Fractures, &c. yield to these Nervine Remedies: yea even Ulcers themselves often cannot be healed, till the tone of the Part affected be restored by such like Nervine Medicines. (2.) Those that are endued with a fixt Sulphur that is friendly to Nature; for whatsoever Symptoms arise in general from salt, acrimonious, acid Spicula, and are allayed by a sulphureous viscosity and a power of demulcing that is friendly to Nature, come into

this number, especially Cinnabarines, which do both singularly comfort and respect all the Pains of all the Nervous Parts, and chiefly the torments of the Joints, especially if they be joynd with Opiats: These therefore are good for the Arthritical, both as they respect the Serum, and as they are indued with the said Sulphur. (3.) And seeing volatil Salts are also indued with an oily Salybur, these likewise may be fitly given inwardly upon that account; and outwardly, both these and also spirituous volatils do service: hence Spirit of Hartshorn and of Sal Armoniack being duly used, comfort the Joints: Thus *Aqua magnanimitatis*, or the Spirit of Pismires is in this case advisedly used outwardly: but Earth-worms do especially belong hither, which have a sweet mucilage in their substance, interwoven with Saline volatil Parts; hence being given in substance in Potions, they demulce the Nervous Parts, and when applied outwardly they have almost always done their office; whence they are chiefly commended in the wandering Scorbutick Gout. Now these things are good in all Pains and Anxieties, but especially in the Joint-gout, Feet-gout, &c. and the Maladies that arise therefrom.

III. Or 3. they respect the *urgent Pain* it self, that arises from the tension and twitching of the Membranes: of which sort are inwardly the forementioned Emulsions, also Cinnabarines and Anodynes, all which do good Service; especially if at the same time provision be made for the fountain of the evil it self by Medicines depurating the *Viscera*, and for the acrimony of the Serum by other Remedies: Outwardly also there are allayers of the Pain, amongst which, omitting all the rest, we only name (1) *Paregoricks*; thus topicks of sweet Milk, fine Flower, Saffron, &c. are commended, and other like fomentations; (2) *Spirituos*, Sulphureous, and Urinous Nervine Remedies: for Nervines are the best of all topical Arthriticks; whence not only the recited Nervine Vegetables have place in some cases, but also chiefly Preparations of Earth-worms and Pismires, such as are the before-mentioned Spirits, the volatil Spirit of Earth-worms, *Aqua magnanimitatis*, Spirit of Hartshorn, of Sal Armoniack, the Oil of Soap, &c.

IV. But we would have it to be noted, that the tone of the Joints is to be preserved; whence too hot and dry internal Medicines, such as exhaust the Serum too much, as they are to be avoided in the Stone, so also in the Gout: There is namely a proportion of the Serum to be observed, the thinner Parts of it are not to be exhausted, while the thicker are left; that is, not the serous Parts, which are the vehicle indeed, but withal the bridle of the Bile, while the saline acrimonious are left. Hence those are much in the wrong that undertake to cure Arthritical Persons by sweating only, caused by external Impellents, as by the heat of a Bath, &c. without using internal Specifick Impellents.

V. But we must not remedy the Joints alone, without taking care of the whole; nor the *Viscera* alone, neglecting the Joints: For seeing the Joints receive and pay for the Vices of the whole, hence in vain (as the vulgar Opinion is) do we undertake the cure, unless the saline acrimony be removed, or unless the fountain be stopped, as I may say: Whence all Topicks are often in vain, nor do they any of them give constant ease. Nevertheless we must see withal, that the Joints themselves be not neglected, whether they be more hurt by external cold, or by Venery, Wine and other things.

VI. As to Topicks, we must note in general this Practical Axiom, That they often exasperate the Pain and Disease; inasmuch as they do not so much demulce the impacted matter, nor so much comfort the afflicted *Archeus*, as make the torment of the

Uuuu the

the Malady greater: so that although the Symptoms seem sometimes to abate, yet there ensue more torturing Pains, or other Symptoms spring from thence: Yea hence those that profit at one time, hurt at another, and so some may be used for defence and strengthening, but others better let alone.

VII. Hence Repellents, or Astringents, or aqueous alone have no place in Pains of the Joints, for they weaken the Part the more, and are inimicous to the Nerves and Joints; which is to be understood of acids themselves also. Hence that which Pliny relates, that M. Agrippa in a sharp Fit cured the intolerable pain of his Feet by putting them and his Legs into acid Vinegar, is not lightly to be imitated.

VIII. Unctuous and fat Emplasticks indeed have place in some of the recited Diseases of the Joints, as in the serous ichor of Ulcers, in pain from the Lues Venerea, &c. but are not so good in Arthritical Pains. Hence we have learned by frequent Experience that Ointments, Plasters and the like have done the Gouty more harm than good, yea that many by this means have made a fixed Gout of a running one, and some have generated *tophi* or gritty Stones in the Part. Hence also Galen himself writes truly, that *tophi* are produced in the Gout from a glutinous and thick Humour, when the same is not digested by little and little, but dried all together by violent Remedies: and Fernelius Conf. 12. observes that the Pains are doubled thereby.

Balnea, or Baths.

The Contents.

The different manner of Bathing according to the diversity of Distempers, &c. I.

How the Body is to be dried in going out of a Bath. II.

The Head is to be dried more accurately than the rest of the Body. III.

How soon a man may eat after coming out of a Bath. IV.

What Diseases Baths are good for. V.

What they are bad for. VI.

Their efficacy for an evacuation of the whole. VII.

Whether we must not give over the use of them, till the Disease quite cease. VIII.

How many hours we must stay in. IX.

Great Diseases spring from unseasonable Bathing. X. VI.

The abuse of Baths is hurtful: they are hurtful to the Arthritical. XI.

In what respect dry Baths are good. XII.

They are to be avoided when Epidemical Distempers rage. XIII.

They are not good where the Serum predominates. XIV.

When saline Particles lurk within the Viscera, Baths are hurtful. XV.

The notable efficacy of Sulphureous Baths. XVI.

We must abstain from them if there be great Obstructions in the Hypochondres. XVII.

I. Baths, as they are very profitable, used aright; so they are dangerous, if used amiss. For some are to be bathed more gently, others more strongly. Those who are bathed more gently are not washed largely, and by pouring the water forcibly upon them, but more sparingly, and by touching them as it were only with the water: These indeed do nothing themselves, (not so much as talk) but those that wait upon them are to do all; they are neither rubbed, nor dried with a Scraper or Flesh-brush, but only with Sponges or Towels; and they are led the nearest way into the Bath (that they be not toiled) the entrance and exit whereof must be easie. Now those are washed thus that

are much extenuated, as the Hætick; or labour of an acute Disease, as the Peripneumonick or Pleuritick; or are sick of a Burning Fever: for none of these can take much pains. But some descend into the Baths strong, labouring of no acute Disease, but for some Morbous apparatus, or Chronical Passions: These are washed longer, for the water is poured largely and violently upon them, and they both wash and rub themselves with their own hands: whether the way to the Bath be long or short, whether the access to it or exit from it be easie or hard, no care is taken; and in the Bath they are rubbed (most strongly those who are washed for a Scab or Leprosie, or other fault of the skin) with some Wash-ball or other extensive Medicine, as Soap, or Bran, or Bean-flower: which Medicines such as are more weak ought not to use, but only the washing, and an anointing with Oil. But if together with driness of the Body, or an acute Disease, there happen some Distemper of the Skin, or there be need of some deterfion because of the nastiness of the Skin through Cere-cloths or Pulveresses that any has used before, let it be done moderately with a little Wash-ball, or rather with the lather or froth thereof that arises therefrom being stirred about in water.

Valles. Com-
ment. in lib.
de Viâ.
Acut. p. 137.

II. The Ancients were wont in Baths to use hard Scrapers made of Stone or some Metal, or of the hardest Woods to cleanse off the filth from the skin: But in those whom we are afraid to scrub hard, and who ought to be used more gently, we must dry their Bodies only by wiping them with Sponges or Linnen cloths; nor must we dry it very much with these neither, but anoint the Body before it be quite dry, viz. with common Oil, which they used in the last part of the Bath, lest their Bodies being newly rarefied by the Bath should be offended by the Air.

Idem, p. 138.

III. But though it make no matter whether or no the rest of the Body be dried exactly, the Head must be dried as much as possible and be wiped with a Sponge; because if any moisture be left in the Head, Catarrhs will be raised thereby, which in all Diseases of this nature are most dangerous. On the same account heed must be taken that the extreme Parts be not refrigerated, neither the Head, nor the rest of the Body.

Idem.

IV. According to Hippocrates (in the forecited place) we must neither use a Bath presently after eating, nor eat presently after bathing: because whether we bathe presently after eating, or eat before the motion of the Bath be ceased, the Meat will be distributed unseasonably, and will be badly concocted, the natural heat being called out toward the skin with the Blood. Nor must we abstain only from bathing the whole Body after eating, but also some particular part: for we must not presently after Meal use an irrigation of the Head or Hypochondres, in the Diseases wherein we use them, except in some rare Passions, as when we irrigate the Head for procuring Sleep; for then we wash when our Supper is not well down, namely that thereby we may cause that very thing which we are afraid of in other Sick Persons, namely fill the Head with vapours. In like manner we may give to those that are much dried, (when they are newly come out of the Bath, nay whilst they are in it) Milk, or some other moistening Liquor, that is easily changed: for because it is easily changed or concocted, it hurts not though it be hastily distributed, and being soon and plentifully distributed it wets the Body the more thoroughly, and moistens it the more.

Idem, p. 140.

V. Hippocrates in the same place shews in what Distempers Bathing profiteth: It is more agreeable in Peripneumonies than in burning Fevers; for it abates the Pain of the Side, Breast and Back: it matures and brings forth the spittle, and makes respiration easie, and wears off lassitude; it also supplies the Joints and the Skin, and provokes Urine, and

cures

cures the heaviness of the Head, and moistens the Nostrils: So that Baths are good for all those that have need of them; but if in their preparation any one thing, or more, be wanting, there is danger, they may do more harm than good: for every thing that is not duly prepared and ordered by the Attendants does great harm. He says they are more agreeable in the Peripneumony than in burning Fevers, because seeing they are hot and moist, they mature and bring forth the spittle, and so take away the pain of the side, &c. all which things are greatly necessary for Peripneumonies: But why does he mention a pain in the Side as accompanying a Peripneumony? I suppose he means by Peripneumonies herenot only an Inflammation of the Lungs, but all Inflammations within the thorax, because of the common accident of difficult respiration, and therefore uses a word of multitude, saying, [in Peripneumonies.] But you will say, if those may not use a Bath in whom there is a fulness of Humours, a great Cacochymie, or a great apparatus for Fluxions, or an internal Inflammation, how can it be proper for a Peripneumony, which is accompanied indeed by all these? It must not indeed be used before the fluxion be ceased, and the greatest part of the store be evacuated by Bleeding and perhaps also by Purging, and the tumour begin to fall; for then the danger of Fluxion is over, and there is present a necessity of concoction and coughing up. When therefore Galen denies the use of a Bath when there is an Inflammation in any inward Part, it is fit we should understand him, before the declination of the Inflammation: Now I here call that the declension of the Inflammation, which is the declension of the tumour it self: and with this interpretation bathing is more profitable for the Peripneumonick than for those that are sick of a burning Fever.

Not but that it may be profitable for these too, if it be undertaken seasonably, as when the greatest part of the Excrements is evacuated, and the Humours are ready for concoction; but only it is more beneficial to the Peripneumonick: For in them it concocts the remainders of the Humours in the Veins, tempers the heat, and will promote any evacuations that are; in these also it both matures the spittle, and brings it forth, and makes respiration ease, and asswageth the Pains of the Breast, Back and Side.

Bathing also wears off Lassitudes, for it supple the Joints, and loosens the Skin: wherefore whether a man be troubled with spontaneous or non-spontaneous lassitudes, he can use nothing better than a Bath, unless there be either such a fulness or badness of Humours, that it is fitting to Bleed or Purge first: As if a man come wearied from a long Journey, if he perceive a Plethora, he will do well to let Blood first and Bathe afterwards; or if he have also collected some considerable quantity of Choler, before he go into the Bath let him take somewhat that may work gently by Stool, as *Cassia fistularis*, and after its operation let him bathe. But if he have neither of these, he will be refreshed by bathing only. But if he perceive neither so great a Plethora or Cacochymie, as may force him to use those evacuations, nor yet so little as that he dare enter into the Bath, in this hesitation let it suffice to abstain from both, and to seek Remedy only by an attenuating diet and rest. Likewise he that is troubled with a spontaneous lassitude, and from thence fears a Disease, unless he perceive a Plethora or great Cacochymie, and be otherwise used to bathing, he may preserve himself by bathing: otherwise he ought to use manifest evacuations for prevention. Yet if a Person either spontaneously or non-spontaneously wearied, enter a Bath, labouring either of a Plethora or great Cacochymie, he will procure to himself such Diseases as he would not perhaps have otherwise fallen into: if he be Plethorick, he may fall into Fluxions, and so perhaps into dangerous Inflammations; if Ca-

choymical, into rigors and putrid Fevers. Whence it is that in a Phlegmonous lassitude we must never enter into a Bath without opening a Vein first; in a tensile one, sometimes we may; but in an ulcerous, generally; but then the Persons must be such as abound not much with either of the aforesaid things, and have been also accustomed to bathing.

Hippocrates says moreover, [and it provokes Urine]; which words may be taken either separately, or as if they contained a cause of what was said before: for a Bath may provoke Urine, and doing so, does wear off lassitude: for as it is said *Aphor. 74. Sect. 4. Much and thick Urine is wont to be made in Fevers which are accompanied with lassitudes, and freeth the Patient from an abscess upon the Joints:* By the same way it will cure lassitudes, and make much toward the suppling of the Joints. But a Bath provokes Urine as it loosens the ways and melts the Humours, and so causes whatsoever stops, to pass out.

It cures also the heaviness of the Head, and moistens the Nostrils: But it is manifest that the moistening of the Nostrils is only needful in those that are very dry; whose Head if it ake, 'tis probable it will be cured by moistening the Nostrils, for thereby the Cause of the Disease will be evacuated. Now the Nostrils that were dry are moistened, when that is concocted which was crude, and that is melted which was concrete; when that which was dry is moistened, and that which was bound is loosened; but a Bath is fit to do all these. As therefore it cures the pain of the Breast by bringing out the Spittle, so it takes away the pain of the Head by moistening the Nostrils. All these good things does a Bath perform, but it is a dangerous Remedy if any of those things be wanting that fit a man for it.

VI. Hippocrates does in the same place number up those whom the use of a Bath offends: It is unreasonable for those to bathe, whose Belly is moister than is convenient, and was not loosened before, as also for them whose Faculties languish, or who are troubled with a Nausea, or Belch somewhat bilious; or for those who Bleed at the Nose, unless they Bleed less than they should do (for you know the Seasons) for if they Bleed less, it is good to bathe either the whole Body, or the Head only, for this will help more than other things. Galen understands the reason, why it is unreasonable for those to bathe whose Belly is moister than is convenient, to be because the Excrements will be snatched into the habit of the Body, and the Stools stopped: But I think this is not the only reason (for on this account it would often behove those to bathe that have a *Diarrhoea*, namely to stop it) but because there is more of vicious Humours than can be revelled by the Bath toward the Skin, the Belly will be rather loosed by the melting of the Humours, and by loosening and moistening of the Intestines and the Vessels that belong to them: But if there remain so little of Excrements that it may be drawn aside by the Bath, it is better to let alone the *Diarrhoea* that is ready to cease of it self, than to vitiate the whole Body for a thing that is not at all necessary.

But neither does he grant a Bath to those who are too Costive: and adding, [and was not loosened before] he shews the Cause; namely some are costive after a great looseness, as men are generally after Purging Physick, in which case bathing is not prejudicial: but if the Belly be bound, and no evacuation went before, it then contains a great deal of Excrement and Filth (and we said before that we must not bathe when the Belly is full of Meat, how much less when it is full of Excrements?) and in such case therefore one must not bathe unless his Belly be first loosened: namely, if upon any account we be compelled to bring such to the Bath, we must first draw down the Excrements with

a Clyster, as we are wont to do for letting of Blood.

Nor must those bathe whose Faculties languish, namely this Remedy is a pretty strong evacuator, and therefore it requires strength to bear it. Now that the evacuation is great that is caused by a Bath, is shewn in the next Paragraph. Yet we will not on this account keep the *Hætick* from Baths, but according to their strength we will bathe them more or less, gentlier or stronger, and some indeed not at all.

Neither those who are troubled with a *Nausea*, or belch somewhat that is bilious, these namely are the signs of a great *Cacochymie*, which we have shewed to be a sufficient hindrance of bathing.

Nor those who Bleed at the Nose, unless they bleed less than they should do; for if they bleed less, it is good to bathe, whether the whole Body receive benefit from the flux of Blood more than by any other Remedy, as in those that labour under a Plethora of the whole Body; or the Head only be profited, as in those who have only a Plethora thereof. The cause whereof doubtless is, that a Bath promotes the flowing of the Blood, liquating of it and loosening the mouths of the Veins. But it is clear that this is meant of a Bath of hot or tepid water; for immersion into cold water stops fluxes of Blood, which Women have learned by daily Experience, who therefore when their Terms flow, shun cold water. We know also that by pouring on of cold water, or by dipping any Parts of the Body into it, bleeding at the Nose uses to be stopt; and so from whencesoever the Blood issue, the using of cold water profiteth, unless it flow out of some internal Part, and especially if out of the Lungs, for then the Blood fleeing back toward the Heart, it may chance to abound more about the Lungs: But an hot Bath increases all evacuations of Blood, and therefore it is to be avoided, unless when an evacuation is seasonable, and the Blood proceeds not accordingly as is requisite.

VII. There is no reason why a Physician should slight that evacuation that is caused by a Bath, as small and not worth mentioning; for from one long-continued lotion (in the water of a Bath) that was made with violent pourings on of the water, I have seen more filth, and tough and thick Phlegm (such as might not be seen only, but also drawn in length by the fingers or a piece of a stick) drawn out this way, than is used to be by the most plentiful Blood-letting, not unlike to that which is wont to appear in the basin upon bleeding in the Foot.

VIII. Whether must we not forbear bathing till the Disease be wholly cured? I answer by distinction: If the Patient perceive the Bath to agree with his Strength and Nature, and that the Disease lessens daily, let him continue the use thereof till it wholly cease: If he be little or nothing benefited, let him take his leave of the Bath, because his Distemper is greater than can be overcome by it. But note, that although the benefit be not manifest, if so be the Patient be not weakened, he must not presently desist; because, as Experience testifies, many that have perceived no benefit all the time they bathed, have some Weeks or Months after their return home been either wholly cured, or at least much helped; because Nature, the strength being recruited by a good and orderly diet, is wont to obliterate all the footsteps of the Disease, says *Aræteus*.

IX. Those err who make the term of staying in the Bath to be, till the Fingers and Toes become wrinkled; for all have not the same habit of Body, in some it is rare and lax, in others hard and dense: the Humors that are dispersed through the Flesh are few and thin in some, in

others many and thick, and perhaps such would sooner faint away, than their Fingers and Toes wrinkle. Others expect sweat upon the Forehead; but the same causes will make it to break forth more easily, or more difficultly in several Persons. They who define a certain space of time, are deceived, for respect is not to be had so much to the hours as circumstances; and the endurance of the strength is the just bound: for old Women, the cold and moist, the robust, those that have a dense and compact habit of Body, the fat, those that are accustomed to bathing, do endure it longer, especially in the Spring and Autumn, than Young men, boyes, old men, the hot, dry, rare, weak, lean, or People unaccustomed to Baths: For the former are less dissolved, and are not so subject to fainting, as the latter: To which add, that some Baths are more generous and effectual than others, and such require a less stay in them; and that some Diseases are more rebellious and fixed than others, and such require a longer bathing. From all which it is clear, that no certain number of hours can be prescribed for bathing in so great variety of circumstances.

X. I have observed that washing or abiding in sweet and hot water is not without danger: A man of Seventy years old, lusty for his Age, coming out of the Countrey towards Evening, and finding himself somewhat weary, commanded a Bath of common water to be presently got ready: Wherein having hardly stayed an hour, and perceiving a fainting Fit a coming, he betook himself to bed, in which being presently taken with an Apoplexy, he died that very Night. Another having heated himself in such a Bath, a Swooning and a great and long Disease followed, with a very great weakness. Hence it appears how full of danger washing in water is, whether it be Simple, or Medicinal by Nature or Art, unless the Body be first prepared: for by bathing, especially in common water, the Body is made slippery, the Pores and all the ways are widened, the Viscera are heated, the Blood boils in the *Vena cava*, and hence the Humours are diffused this way and that way, &c.

XI. *Helmont* reckons the frequent use of *Thermæ* or hot Baths amongst the impediments of life: It is certain indeed that by their use the antecedent cause, as fluxions or Humours turgid with wild or preternatural Salts, is removed, whence they have profited some gouty persons, whose members were swelled by the preceding distemper, and they have found ease for a time; but what becomes in the mean time of the *minera* or fountain of the Disease? this being left untouched, especially in Diseases that consist of their ferments, how should it not be made more fierce, and tyrannize more over the Body? Not to mention that being sometimes administered to the hypochondriacal, by operating more vehemently on the ferments of the viscera they destroy them without our observing it, and change the whole mass of Blood and the nervous juice by their violent action, and exalt the heat of the Bowels, which is the cause that occasion is given for new ebullitions afterwards, and a source of new fluxions springs up, the members become slippery and relaxed, the Body being softened by them; and lurking fluxions, especially in less prepared Bodies, being dissolved thereby, from a little fire there has arisen a great flame, the malady growing worse. Whence *Omicrius* in *Epist. 7. l. 5. Timæ*, speaks very much against their use, saying, That he had so ill success from the use of *Thermæ* or hot Baths in the Gout, that contracting an *Hætick* heat thereby he was almost become *tabid*, yea and that his fits were more frequent and cruel than they used to be ever before: I have known none, proceeds he, that was freed from fits of the Gout by the use of them: but that every one found the fits rather stronger and

Fabr. Hild.
Cent. 6.
Obs. 96.

and frequenter as soon as they enter'd into such Baths. Hence some attribute to some *Thermæ* a certain arsenical poison that is an enemy to the vital powers: *F. O. Grenib. l. 3. c. of the shortness of Man's Life § 77. p. 472.* Perhaps through the arsenical poison of the Sulphur, whose halitus affect some mens nostrils. Although besides this deleterial quality they want not others also, which are like those occult ones that are drawn from the class of Minerals, seeing it is clear by experience that they have in process of time produced in the indisposed (besides erosions of the viscera) cachexies, atrophies, in some swoonings and other admirable Symptoms. So that some are of opinion, that the same thing happens to some *Thermæ*, especially taken inwardly, which * *Th. Erastus, T. Zwingerus* (in his preface that he prefixed before *Santis Ardyni's* book of poisons) and *Oporinus* (in his Epistle concerning *Paracelsus's* Medicines and their deleterial vertues) have left written, viz. That many who for a time have found help from these Remedies, have died in a short while after: The examples are odious; but I leave these things to be further examined by others. See *Moser* of the abuse of *Thermæ* and *Acidulæ*; and the history of the Life and Death of *Bacon Lord Verulam*.

XII. Dry Baths in an heated air, seeing they too much inflame the Body, and drive Humours violently toward its surface, are not so approved of as moist. Yet if such Bath be made of the steam or smook that arises from the decoction of a moist Bath, we may a little heat our Body thereby, and so dispose it for its entrance into the moist bath, that this latter may operate the better.

XIII. Note that Baths are not so convenient when Epidemical distempers rage, especially, the plague, for by opening the pores they make the entrance for the contagion the easier.

XIV. Baths are not good when the Serum is much increased or moved, whether in a state that is partly according to Nature, or in a preternatural; whether as to the whole Body, or to some certain parts: hence they are wont not to succeed so well in the cacochemical and plethorick, whence they do hurt in the cachexie, Dropsie, as also in the cough, coryza, catarrhs upon the breast: yea there have been some who being troubled with a coryza (or defluxion of rheum into the Nose or Ears) have upon their entrance into a Bath lost their smell or hearing. Nor are they good in Inflammations of the parts, as in an erysipelas. Nor is *Helmont's* opinion to the contrary to be regarded, who says, that such Baths are often good in distillations; because they are not profitable even to the Gouty themselves: for we have observed that the parts being thereby swelled, have occasioned the greater afflux of Humours.

XV. It is clear by experience that hot and Sulphureous Baths do very much exalt the Saline and other morbid particles in Mans Body, that dwell within the viscera or are contained in the Humours, and bring them suddenly to the highest pitch, namely by exagitating of them they make them more unruly, and drive them forward out of the first ways into the Blood and from thence into the Brain and genus nervosum, and moreover join together those that were severed and quiet before, and excite them into a certain effervescency. Wherefore those that are subject to either an hereditary Gout or Stone, and as yet have had no fits of those distempers, do often perceive that by the use of Baths the fruits of both these Diseases are presently ripen'd in them.

XVI. Sulphureous *Thermæ* or hot Baths contain four things, 1. Water, 2. An oiliness, 3. An acid Spirit, 4. A little lixivial Salt: For Chymists know that all Sulphur does chiefly consist of an oil and an acid Spirit; and it is manifest 1. from its ready bur-

ning, whereby it is clear that oil abounds in it, for only fat and oily things are the fuel of fire; 2. From its long continued burning, which depends upon an acid Spirit; 3. From the oil that may be drawn from it per campanam, which testifieth its acid Spirit. Seeing therefore Sulphur consists of an acid Spirit and oil, it is manifest that Sulphureous Baths abound with the same. Now these are generated of a Water endued with a very acrimonious lixivial Salt concurring with the minera of Sulphur, by which Salt and the acid Spirit of Sulphur there is raised an effervescence and with the effervescence an heat, and so the Water also and the Oil do join after a sort into one. These Baths have a notable penetrating vertue, wherefore they reach to the inmost parts of the Body that are affected: Now that which penetrates so, is the acid Spirit that is intimately mixt with the lixivial Salt and temper'd with the oil, by the vertue of which oil it tempers also the acrimonious Humour that sticks to the Membranes and twitches them, and gives occasion for convulsions, &c. I say it both tempers it by its oily substance, and also corrects the same by an exact mixture of the lixivious Salt and acid Spirit, whereby the acidity is overcome that is always hurtful, and is the primary cause of gnawing in convulsions, &c. For the subtil lixivious Salt of the Baths being in a manner volatiliz'd, is the best and perhaps the only thing for coagulating the more subtil acid Spirit. Therefore it will be the office of Art to imitate nature, and to render the lixivious Salt volatil and fit for coagulating the subtil acid Spirits, and withal for curing the distempers arising thence.

XVII. We must abstain from hot Baths whilst obstructions are present in the hypochondres, the mela-raick Veins stuffed with tartareous juices, and the mass of Blood impregnated with Salts that are as yet with wild, acrimonious and acid; for by the Bath these might be melted and fused, and being so, might be carried into other parts and more principal viscera, and there raise other more grievous Symptoms.

Caputpurgia, or Purgers of the Head, Errhines or drawers out of Phlegm by the Nose, and Ptarmicks or Sneezing Medicines.

(See Capitis affectus in genere, or Diseases of the Head in general, Book 3.)

The Contents:

- The Nose is the Emunctory of the Head. I.
- Ptarmicks and Errhines operate by irritating the Membrane of the Nostrils. II.
- How Ptarmicks and Errhines differ. III.
- Errhines respect especially the private or peculiar fault of the Nostrils. IV.
- Ptarmicks relieve the Head. V.
- When they are chiefly to be used. VI.
- What Distempers they are bad for. VII.
- They are owing to the Humours. VIII.
- When Errhines are to be used, and when Apoplegmatifms. IX.
- White Vitriol is an effectual Errhine. X.

I. WE take it for granted that the Nose is the Emunctory and van as it were of the Brain: for whatsoever some have imagin'd to the contrary concerning the publick use of this Sierce which is destin'd for the service of the whole machine, yet by the opinions of the Ancients and the experiments

experiments of the more sagacious Moderns, it is certain that the fountain indeed of Catarrhs is not to be sought for in the Brain, but in the inseparable companion of the Blood, the *Serum*, (for of Blood and *Serum*, as of hot and moist, do the elements of life consist;) or in the abundance of the *Lympha* separated by the glands, into which the Lymphatick Vessels either end or arise therefrom: But to affirm that the Brain is altogether free, privileged and exempt in Catarrhs, is to deny that it is water'd with *Serum*, which is absurd, or that it is not affected in a *coryza* or other Catarrhs, which is against experience.

Wedel. de
f. m. fac. p.
228. See
Willis. cer.
Anat. c. 12.

II. The reason of the activity and operation of Ptarmicks and Errhines consists in the sollicitation, irritation and twitching of the sensible Membrane of the Nostrils by an external cause: hence whatsoever things do more nearly affect and as it were tickle this Membrane, the same do move excretion either simply, or with sneezing. Thus not only a feather put up the Nose causes sneezing, as also even the unequal *afflatus* of the ambient air, the Sun-beams, &c. but also especially all those things that are communicated to the Nostrils, which are endued with a saline quality and acrimony, whether fixed, as white vitriol, or volatil: So all acrimonious things and all Purgers are Ptarmicks.

Idem.

III. The more the saline goads are left to themselves, the more they stimulate; the less they are left to themselves or the more obtuse they are, the less they stimulate. The former are called *Ptarmicks*, that is, which stimulate with sneezing; the latter *Errhines*, that melt the Humours without sneezing. Hence that the saline *spicula* may approach the Membrane of the Nostrils the more intimately, Ptarmicks are given in powder or in a dry form, for so they operate more, and the more finely they are powder'd, the more strongly; so that they differ not but in degrees. The saline *spicula* touching the Membrane of the Nostrils on this manner, three things follow, 1. The irritation it self; 2. The fusion and liquation of the Humours; 3. The excretion it self.

Idem.

IV. Errhines are more used for the private service of the Nostrils, Ptarmicks more for that of other Parts. Errhines are most useful and profitable in a *Coryza*, *Ozena*, *Polypus*, for cleansing, dissipating and procuring a free passage for the Humours.

V. Sneezing Medicines ease the Head both in general, and also in special, when the Body is evacuated and the antecedent fœvel taken away; for they are not good when the matter is too plentiful and stagnating: Whence in a *Coryza* and Catarrhs they take place rather in the declination and state, than in the beginning, when all things are crude.

Idem.

VI. They are chiefly of use when the faculty is asleep as it were in the Watch-Tower of the Body. Hence if they operate not when they are exhibited, they often signify the faculty to be even dead; which I have often seen, in Child-bed Women and others, in as much as Nature is no longer sensible of the goad, nor actuates; which holds good also in others, as for instance, in Purgers.

Idem.

VII. When those parts are indisposed that necessarily concur to sneezing, Sternutatories are not proper: whence they do harm in venereal pains of the head, in fractures, in luxations of the Ribs, Ulcers of the Lungs, Spitting of Blood, Ruptures, &c.

Idem.

VIII. Ptarmicks are owing to the Humours, for the bringing out the *Serum* that stagnates about the coats of the Brain, and withal discuss whatsoever sticks there: Hence they are rather to be used in distempers arising from a positive cause, than from a privative: and hence also they are not so convenient in too much driness, and for the Cholerick and Melancholick, but more for the Phleg-

matick in whom the *Serum* is more plentiful, the coagulation whereof it is the chief property of these kind of Medicines to hinder.

IX. Few know when Phlegm is to be drawn from the Brain by Errhines, and when by Apophlegmatisms, or when by both. By Errhines, and so through the *os cribroforme*, is to be drained away that shivel that is collected in the space betwixt the right and left part of the Brain, and is sent into that space from the *Cortex* of the Brain: By Apophlegmatisms, and so through the *os Sphe-noides*, that must be drawn out which is collected in the Ventricles that are made for this purpose, and is driven thither from the *Medulla* of the Brain.

Hofman. in
Instit. ex
Riolano.

X. I have found that white vitriol dissolved in simple or some cephalick Water, and applied gently with a feather to the nostrils does in a due quantity liquefy Catarrhs according to ones wish and draw them forth, so that I have sometimes happily used it even to Infants new born that were hardly able to suck and were ready to be suffocated through obstructions of their Nostrils, as it often happens: In which case, when neither oil of sweet Almonds dropt into the Nose, nor Majoran Water infused thereinto had any success, this Medicine accomplished my desire.

Their nature and differences. I. V.

When to be used. II.

The abuse of Volatils. III. IV.

The abuse of Moschates. VI.

I. **S**Being those are Cordials that succour the labouring Heart, we will premise, 1. That the Heart and Blood are fellow causes, and are not to be severed, as some do. 2. That the Blood consists of two parts, a *calidum* or Blood, so called by way of excellency, and an *humidum* or *serum*; in which two alimentary Humours our Life and Health consists: nor is there any other innate heat or radical moisture besides these indued with their vigour and vital ferment. 3. We shall call those Cordials, that dispense the Blood and heat (whereof the Heart is the fountain) and do dispose the consistence of the *Serum*, and the motion and vigour of both. They are therefore such as either 1. rarify the Blood, when it seems to fail in its *εκκλυσ-τις*, or brightness, and is weak, when its Sulphureous and volatil, Mercurial and Spirituous particles are either obtuse or not vigorated in a sufficient degree; such as these are good in languishings of the Heart, lassitude with malignity, old age, Paleness, Cold, Cachexie, Ague-fits, weakness, anxieties, when the motion of the Heart fails as it were, as it does often in malignant Fevers when there is a recourse of the malignity to the Heart, or in driving out the Small Pox or Measles, &c. Of this sort are (1) *Sulphureous volatils*, and those either *Spirituous*, as the Spirit of Roses, the apoplectic water of Roses, Brandy, &c. or *oleous*, indued with a volatil oleous roscid Sulphur, which use to be called in one word *Balsamicks*, as *Lignum Aloes*, Camphor, Myrrhe, all Odoriferous things, which have an immediate commerce with the Spirits, Spices, Cinnamon, Cardamom, oil of Cinamon, Mosch, Amber, also Treacle, Mithridate. (2) *Saline Li-*

quids

als, as Salt of Worm-wood, of *Scordium*, of *Carduus Bened.* &c. which together with a precipitating vertue do notably also rarefie the Blood and reduce it into order, whence they are excellent febrifuges and sudorificks. (3) *Urinous Saline Volatils*, which are almost the most powerful of all, as the Spirit of Harts-horn, of Sal Armoniack, of Soot, of Vipers, of Hart's or Mans Blood; these also being mixt with oleous, and so being made oleous volatil Salts, have the same vertue. Hither belong also *fetid Medicines*, whether Sulphureous chiefly, or also Urinous, which are good in Fainting and Hysterical Fits and the like. Observe, that the rarefaction of the Blood denotes two things, 1. the restauration of the failing Spirits, which is chiefly done by Balsamicks and Sulphureous; 2. the vigorating of the motion and fluxility of the Serum chiefly, which is especially done by Salines.

Or 2. Such as hinder rarefaction, which (as the above said restore the Sulphureous, Balsamick and Mercurial volatil Particles in the Heart and Blood, so these) depress, blunt and precipitate them when they are too fierce and high: and they are either (1) *Aqueous*, diluting and restoring the Serum, the defect whereof renders (amongst other things) the rarefaction greater, as temperate Cordial waters, the water of Endive, Sorrel, *aq. Herc. Saxon. frigida*, Whey, &c. which being dispersed through the Blood do somewhat enervate the volatil Parts: Whereby it is clear, that Juleps, and Small beer also it self ought to be granted in a larger quantity in Fevers, and the Patients are not to be so strictly compelled to thirst. Or (2.) *Acids*, which are of the chiefest rank among these, whence it may be for a rule, *An acid tames or dulceth Sulphur*, as the juice of Citron, and Pomegranate, acid mineral Spirits, the Tinctures of Violets, Roses, &c. Or (3) *Nitrous*, which in like manner infringe and debilitate Sulphur, promote its exaltation and notably attempt it, and vigorate the Serum restoring it to it self, as *Lapis Prunellæ*, *nitrum antimon. perlatum*, &c. Or (4) *Earthy*, absorbing and precipitating, as Corals, Perles, pretious Stones, Bezoar, &c. And these maintain their place in all kinds of Fevers, and are excellently good for other bilious ebullitions (for Choler doth most of all rarefie the Blood) as in Distempers proceeding from anger, in Madness, *deliriums*, Phrenies, burning Fevers, &c.

Or they respect the consistence of the Blood, and are 3. such as hinder its resolution and preserve its consistence that is ready to be violated; whether by concentrating the Sulphur, as *acids*, whence these are most especially convenient outwardly in hindring the resolutions of the Spirits, and are good in Swoonings, colliquative sweats and when the Blood is turning to Ichor, with Mador, &c. such as are those already mention'd, but especially simple Vinegar and Vinegar of Rue, &c. also things actually cold outwardly, cold water, the water of Roses: Or by attempting the Serum, as watery Medicines, especially *Emulsions*, which have somewhat Mucilaginous in them, whence they are of very great use in Malignant Fevers, especially where watching and *delirium* are urgent: Or by strengthening as it were the band of each, (the Serum and Blood) by gently concentrating and collecting of them, as *Mucilaginous* and *earthy Astringents*, also temperate Balsamicks, as for example Harts-horn prepared Philosophically, Ivory prepared without Fire, Gelly of Harts-horn, Bole-Armene, Sealed earth, balauftins; and amongst hot things Cinnamon, *vitriolum Martis*, which enjoy also an earthy quality. Hither belong also *Opiats* themselves; for it is found by the experience of Practitioners, that *Laudanum Opiatum* is very conveniently given in the resolution of the vital Spirits and Blood, but only in a small quantity, that by this means the further dissolution of the Spirits may be hindred. We have seen wonderful effects thereof in the Fainting, Hysterical and

others. These may be mixed either with *Spirituosus analepticks*, as *consilio Alkermes*, that by this means both the dissolution may be hindred, and matter supplied to the Spirits; or with *earthy absorbents* and *resolvents*, that on this manner also the consistence of the Blood may be respected.

Or 4. They are *resolvents*, that hinder, dissolve and dissipate the clodding and as it were curdling of the Blood, whereby it is stopt as it were in its motion; they hinder the incoction of the Serum, and so by removing also some impediments, medietely help its rarefaction: and they are both the Balsamicks already spoken of, and also some *resisters of putrefaction*, as likewise watry *diluters*, but especially *terrene Medicines*, which otherwise are profitable in falls from on high, Pleurisie, &c. viz. Corals, Crabs Eyes, *antimonium diaphoreticum*, &c. *Acids* also, for these are of a middle nature as it were, both coagulating the dissolved Blood, and dissolving the coagulated: For in both cases the Blood does clod as it were, both by too much resolution, and by too much coagulation. Hence we must note that *acids* being joyned with Bezoardicks, do by their penetrating vertue, strengthen the Bezoardick and Sudorifick vertue, as for instance, the *mistura simplex*, where neither the theriacal Spirit nor the Spirit of Tartar do so much move sweat, much less the Spirit of Vitriol, yet these being joyned together promote it notably. Hither may be referred what was said of the first class of rarefiers. And these are good also in palpitation of the Heart, Fainting away, Malignant Fevers, &c. And such Medicines as perform these things eminently, namely that defend and preserve the consistence of the Spirits and Blood, that it may neither decline to a state of fusion, resolution and ichorecence, nor of coagulation, I say such as these are properly, and are called, *Bezoardicks*. All diaphoreticks also do the same thing, and especially Alexipharmacks. Nor hinders it that these, and especially the temperate are not carried immediately to the Heart; it is enough that they vibrate their operations presently out of the Stomach into the Blood, whose crasis is hereby changed, and whose energie and affection results to the Heart; yea such Cordials do often respect and take away at least the antecedent cause; however their operation obtains their end in the Heart.

II. Where there is great debility of the faculties we must not presently flee to comforting Cordials, nor indeed to them alone, but the causes are to be removed, whether there be a *Plethora* suffocating the Spirits, or a *Cachochymie* defiling them; whence often either Bleeding or Purging will do the business. The vulgar are here mistaken.

III. Let all *Volatils* consist within the bounds of Mediocrity, both in Diet and Pharmacy, and that both in the Sulphureous and Urinous. So those that in their youth drink too much Wine or Brandy, do in their following age hereby lose the strength of their Stomach, inasmuch as their decreasing heat does hence require some stronger heater: so also Medicines with Camphor, and distilled oyls do often hurt.

IV. Hence we must never so rarefie as not to mind at the same time the consistence of the Blood, that it may be brought to a natural state: Nor must we so use *Resolvers*, as not to observe the tone and due rarefaction of the Blood. Whence those offend, who (for instance) in Malignant Fevers exhaust their Patients only with volatils and perpetual sweats, when they ought to discuss indeed and preserve the rarefaction, but to temper it when it is too much. So those who use *Resolvents* more unwarily, easily make the *compages* of the Blood too lax, so that the Spirits perish as it were and dissipate; which must be noted in particular of *Cinabarines*, for they do most of all resolve the Blood: But do nothing too much, and in all cases, having premised

G. W. We.
del. de f. m.
fac. p. 93.

Idem, p. 94.

Idem.

premised universals, tonicks are to be interposed and moderate astringents.

V. Comforting Cordials are to be rightly distinguished; whence where *Serum* (for instance) is wanting, scarce any thing will do so much good as actually moist and watery things, without omitting acid or nitrous Medicines; and on the contrary, let us not give one thing for another, nor confound the same.

VI. We must not rely too much on moschated Medicines, which do greatly rarefie the Blood; for while they too much exalt and heighten the Mercurial particles, instead of comforting they easily hurt Nature, and commonly they do more good outwardly than inwardly, or at least unless when seasonably given: they have their use, but then they must be used rightly.

Idem.

Carminatives, or discussers of wind.

The Contents.

The way how to know to discuss wind or to hinder its generation, depends on the knowledge of its production. I. X.

The preservative and curatory Indications. II.

Many while they endeavour to dissipate flatus, produce them.

III. VIII.

Opiats discuss them. IV.

Carminatives are either habituous and rarefying; V.

Or absorbing and tempering: VI.

Or they help the heat and ferment of the Stomach. VII.

The hot and thinest are not always to be used. VIII.

They are not good in drines of the Intestines, and where the excrements are hard. IX.

They are to be varied according to the variety of causes. X.

I. **W**heresoever flatus are, those things contribute to their excretion that take away the impediments through which they inhere the more firmly in the parts, viz. the clamminess and glutinousness of the Phlegm from which they are produced, and such as are Aromatick, and abound with an Aromatick oil. Now I think that flatus are truly discuss'd, inasmuch as their very tenacious matter is incised and broken, whence the pituitous matter that was distracted and distended into flatus subsides, and falls into a little globule of Phlegm. For it seems to be done in the same manner, as when Boys are wont to raise bubbles through a straw-Pipe from soap dissolv'd in water: The bile being joined to the glutinous Phlegm, by rarefying of it distracts it into flatus, which by further rarefaction at length are broken of their own accord, and so by and by the Phlegm that was before distracted and rarefied coheres, and returns to its former Nature and consistence; the action of the Bile ceasing then through want of matter to act so upon, unless it can insinuate it self into some other piece of Phlegm, which it may distract into flatus and rarefie in like manner.

*Syl. de le
Boe Meth.
Med. lib. 2.
c. 21.*

II. The production and mischief of flatus is to be corrected, 1. by gently cutting the more glutinous flegm; 2. by discussing and dissipating, or otherwise suffocating these flatus; 3. by correcting the acrimony of the bile that is the Efficient cause of the flatus: And the Phlegm, after it is loosed by the bile and turned into flatus, must be gently incassated again, but not be made very glutinous. The Phlegm may be incised by volatil Salts, and all Aromaticks, and most Acids; but these are chiefly good, where there is fear to encrease and heighten both effervescencies, both in the heart and in the small Gut; in which case 'tis advisea-

ble to abstain from volatil Salts, as also from Aromaticks, both lest the store of flatus be increased, and also lest the bile be made either more acrimonious or more volatil. Among those Acids the chief place is to be given to the Spirit of Nitre as well pure as sweet, seeing it not only cuts glutinous Phlegm, but also discusses and breaks the flatus, yea and also tempers the acrimony of the bile, and fixes it when it is too volatil. This Spirit of Nitre may fitly be taken in ones usual drink, or any other Medicinal one, and that indeed in an indifferent quantity, whereby neither a nausea may be caused, nor its operation be either too strong or too weak.

III. As to the discussion of the Flatus themselves already raised and in being, I know nothing comparable to the said spirit of Nitre whether pure and simple, or made sweet, seeing most of the Medicines vulgarly known are Aromatick, and in that respect heighten and increase (after a sort at least) the acrimony of the Bile; whether I refer Volatil Salts themselves of what kind soever, all which give place to Nitre. Hence our Physicians are so solicitous about prescribing Medicines for discussing of wind, being often taught by sad experience, that such as have been given have not a little hurt their Patients, through the Bile's being made more acrimonious, & the heat increased in the body by them. The reason of which effect all such are ignorant of, as know not both the nature and reason of each effervescence, the hot and the cold: which things being understood, the reason of the burning caused by the use of Carminatives is easily perceived; and, which is the chief thing, the way is also perceived how this evil may be prevented.

*Idem
Append.
Tract. x.
Sect. 608.*

IV. Opiats hinder the generation of Flatus better than most other Medicines, such as Treacle, Mithridate, Philonium Romanum, Regiæ Nicolai, &c.

*Idem
Tract. 9.
Sect. 254.*

V. In this respect they are good with diaphoreticks, that they discuss and resolve, whence there are many diaphoreticks that are also carminatives, as the carline-thistle, zedoary, antimonium diaphoreticum, &c. which are so much the more excellent, that they both resolve, and also expell by sweat and perspiration: And they are either (1) *habituous rarefiers*, which by their thinness and their subtle and volatil vertue of attenuating heat, and correct the Phlegm whether insipid, or especially Acid, such as are both chiefly volatil oleous things, or Medicines endued with a Subtil Balsamick Sulphur married with a volatil Salt, which both restore the debilitated heat, (for an heat comparatively weak is the Father of flatus, and the Mother is a watry, or Acid, cold and viscid Humour, or Phlegm agitated into vapours) penetrate every where by their habituous vertue, and by this their subtil and volatil vaporosity help the explosion of the thicker vapours that are generated; as for instance, the four carminative Seeds, all Aromaticks, especially the roots of zedoary, galangal, and their distilled oils. And also volatil Acids, as the Spirit of Salt, simple and sweet, which we have sometimes observed to have removed the Colick like a charm. But these same oleous volatils, or Medicines indued with a volatil oleous Sulphur, are also paregorick, nervine and demulcing; whence withal they do very well help the pains & tensions of the Membranous parts that arise from wind: And these are very good both outwardly and inwardly in many distempers, as the Colick, Vertigo, fits of the Mother, and in the griping pains after Child-Birth, wherein in particular the roots of zedoary and galangal are profitable; in the flatus of the Womb, the rupture, wherein both by mine own and Helmont's experience the four greater carminative hot Seeds are excellent; in the noise in the Ears, &c.

VI. Or

VI. Or (2) they are *absorbing* and *temperating*, such as not only saturate the prevailing Acid, dry up the Humours, and precipitate the vapours arising thence; but likewise if rarefied bile concur also, they tame the flame, and in one word break these *Surduets*, or Powers, and restrain the Seminal Ferment of the *status*, and the wild exhaling gas; yea, if there be an excessive heat joined, and so a *Phlogosis* or Inflammation of the *Viscera* accompany, as in the Hypochondriacal, they respect the same too. Such as these are both *earthy Precipitators* and *Diaphoreticks*, as especially *Antim.* *Diaphoret.* Shells and Crabs-eyes prepared, &c. and also chiefly *Nitrosalines*, and *Alkalines* likewise, Tartar vitriolate; the tincture of Tartar, *Arcanum duplicatum*, &c. Refer hither Mineral Waters or *Acidulae*, the *Clyssus* of Antimony, &c. These are chiefly good in the bilious Colick, Hypochondriacal *status*, Tympany, Fevers, Palpitation of the Heart, *Vertigo*, and the like. And it is to be noted that these things may also be given mixed, where we would withal Precipitate, and also stop Pains, as chiefly in the *Cardialgia*, or pain at the Stomach, in which case I have often with great success given the Oil of Cloves with Shells prepared, in a dry form; with *essentia carminativa* and the Essence of Castor, in a liquid, &c.

VII. Or (3) they are such as strengthen the concoction and heat, and corrupted *Menstruum* of the Stomach, whether they be *Precipitators* and *Inciders*, as the root of Aron, Ginger, &c. or other Aromaticks and Balsamicks, fitted for whatsoever excess. For as the Stomach is always to be taken notice of in *status*, and as the same do usually arise from the frustrated action thereof; so these very Stomachicks also are deservedly reckoned among Carminatives: and these are particularly good in Belchings, Hiccough, *Cardialgia*, Inflation after Meat, &c.

VIII. The thinnest and potentially hot volatils are not to be used in all flatulent cases, especially in the Hypochondriacal, for whom the more temperate are for the most part better, which may allay the Inflammation or *Phlogosis* of the *Viscera* that is fed by saline and nitro-sulphureous Particles: whence temperating and refrigerating things themselves seem requisite in this case for the destruction of the *status*, in as much as by this means the natural heat will be set to rights.

IX. They are not good if there be a driness in the Intestines, and hard Excrements cause Obstruction: for in both cases unless there be first an evacuation of the Matter and a sufficient depletion, they are all not only in vain, but they also precipitate the Patient into a far worse state. *Crato Conf.* 177. writes that some in the Colick do very badly hasten presently to discuss the *status*, by giving Carminatives; which indeed in a lighter Colick do answer desire; but in the more vehement, generally hurt.

X. As the productive Causes of *status* vary, so does their Cure, whether they spring from an internal cause and the faculty hurt, as they call it, or from an external error. Thus as Pulse, Pot-herbs, things abounding with excrementitious moisture, things sweet, fat, or crass and slimy, feculent, &c. breed *status*; so by obviating crudities, that is, by precipitating them by Acids, Aromaticks, &c. according as the Case is, must we endeavour the Cure.

Cauteries, Fontanels, Inuisions, Setons.

The Contents.

What humours Fontanels or Issues drain out, and from whence. I.

They are not available in all Diseases. II.

Where they are to be made for revulsion sake. III.

Whether there be a set time for keeping of them open: And whether there be always fear of danger from closing of them. IV.

The Efficacy of an Issue. V.

Cautions about the Issues that are wont to be made in the ordinary places. VI.

Conditions requisite to make them profitable. VII.

Certain unusual places in which they may be made with benefit. VIII.

The Profitableness of perforating the Ear in many Diseases. IX.

The way to make a Fontanel in the Coronal suture. X.

Those Issues are best that are made by excision. XI.

Whether is best, to make them with an actual or a potential Caustery. XII.

We must proceed warily in the application of a Potential Caustery. XIII.

We must take heed of mistaking the place where the Caustick should be applied. XIV.

How deep the Caustick should eat. XV.

It must not be applied to a weak Part. XVI.

Issues must not be made in Persons that have a very ill habit of Body. XVII.

Whether they cause Barrenness. XVIII.

They are not to be rashly dried up. XIX.

Why they sometimes run nothing. XX.

How their Operation is to be helped. XXI.

A supervening tumour not to be ascribed to the mistake of the Physician. XXII.

Let not Causticks be made of Astringents. XXIII.

Those Issues that break out of their own accord, are not to be stoppt. XXIV.

If the Body be foul, apply not a Caustick. XXV.

A Compendious way of making a Seton. XXVI.

When we make it, we must take heed of hurting the Tendons. XXVII.

It is best making a Seton with an heated Instrument. XXVIII.

In Children it is to be preferred before an Issue in the Neck. XXIX.

Whether a Seton is to be made lengthways or breadthways. XXX.

Let not the ligature upon Issues in the Arm be too strait. XXXI.

The best Issues are in the Thigh if convenient Ligature can be made. XXXII.

The Profitableness of Inuisions. XXXIII.

The difference of them according to the different intention. XXXIV.

How the Arabians make their Inuisions. XXXV.

Whether Inuisions of the Abdomen that were in use amongst the Ancients, be to be approved. XXXVI.

There is a Caustery without Pain. XXXVII.

I. Fontanels, as well as Vesicatories, drain out whatsoever Humours are fixed within the Skin, though in a less compass, or that are drawn through it both from the Blood-Vessels and Nerves: But they do not only, like Vesicatories, pruritate and milk as it were the outer surface of the Skin, but by perforating the Skin also, they convey outwards all that exudes from the sides of the hole by the broken vessels, and that also which is sliding from other places under the bottom of the hole. Wherefore there flow to Fontanels (or Issues) not only those Humours that are heaped up within the

X x x

Pores

Pores of the Skin or the Glands, or which are sent thither by the Arteries and Nerves: but moreover the serous Excrements under the Skin, that use to creep from place to place by the interstices of the Muscles and Membranes, do from every hand tend towards them, and find an exit by them. Besides, an Issue being placed in the way anticipates the Morbifick Humours that are wont to be carried to other Parts that were before weak and long afflicted, and so frees sometimes one Part, sometimes another from their incuse, and like a Bulwark defends them from the Enemy. Hence the matter whether Arthritick, or Nephritick, or Colical, yea sometimes the Paralytick, or otherwise the Scorbutick, as it passes out of its Fountains to its nests or diseased Parts, is often intercepted by Issues, and so is carried out, with the escaping of the usual invasions of the Disease. This Emissary or Outlet also, like water-furrows made to drain the ouziness of the Earth, does by little and little drain out the Humours that are settled in any part or region of the Body, and are there doing harm, and so they either prevent or cure a morbid Disposition.

Willis.

II. From these various ways of helping, whereby Issues are wont in general to profit, it is easily gathered for what Diseases they are chiefly requisite: for though there be almost no Disease, to which this Remedy is either hurtful or unprofitable; yet it seems more necessary in some cases than in others. It is commonly prescribed for almost all Diseases of the Head, both internal and external; for the Convulsive motions of Infants and Children; for their Ophthalmie, and firmous Tumours: Nor is this Remedy in less repute for Diseases of the Breast, as also for those of the lower Belly: Nor is there any Gouty or Cachectical Person but has his Skin as full of holes as a Lamprey. But truly this Remedy howsoever profitable and benign of it self, is not agreeable to all. For there are two sorts of Men, who although they were diseased, may be excused from Fontanels, inasmuch namely as this Emissary evacuates too much in some, and in others less than it ought, and in the mean time is very painful. 1. It is not convenient when it too much evacuates, or spends the moisture or spirits. I have observed in some, that an Issue made in any Part of the Body, pours out an ichor immoderate in quantity, and vicious for quality: out of it namely, very frequently if not always, there ouzes in great plenty a watry, thin and stinking Humour, often colouring the Pease and Coverings black, and by the too great efflux hereof the Strength and Flesh are wasted. The reason whereof seems to be, that in some who have their Blood and Humours ill disposed, when a Solution of continuity is made and hindered from healing, it shortly turns into a stinking and ill favour'd Ulcer; the sides whereof put on the nature of a corruptive acid Ferment; whereby namely the Portions of the Blood that are continually driven thither are so tainted and dissolved, that the Serum having its Sulphur loosened and being imbued with other defilements, is rejected of the Veins and so issues plentifully out there. Moreover this corruptive taint of the Issue being communicated to the Blood doth in some sort deprave its whole mass, and thereby (as also through the too great loss of the serous Humour) renders it at least less nutritious. And from the Sulphur of the Blood's being dissolved on the sides of the Issue and flowing out with the Serum, does the ichor that flows out sink so and blacken the Linnen. Sometimes the Fontanel pouring out no immoderate quantity of ichor, does yet unduly consume the Spirits and Strength, which indeed is known by the Effect, and sometimes only *à Posteriori*; inasmuch namely as some, while they have one or more Issues open, continue languid and lean; but these being

sopt they presently become more brisk and fleshy. Moreover 'tis a vulgar observation, that many upon having an Issue made near their Head, have been taken with some defect and weakness of Sight, so that they have been forced to close it again presently: which seems therefore to happen, because where the store of Spirits is small and their consistence very thin, small expences of them, or of the juice out of which they are bred, if so be they be constant, are hardly born. But 2. Fontanels, as also Vesicatories, are forbidden some (or are warily prescribed) on another and indeed a different regard, namely because, when they evacuate almost little or nothing, they vex and pain very much the place in which they are made. For such as being of a Choleric or otherwise hotter temper have their mass of Blood thicker, and less diluted with Serum than it should be, and its *Compages* too strict, in such I say a solution of continuity being made and continued for the Issue, the Blood it self sticks in the passage, and so being extravasated causes a very painful *Phlogosis*; and in the mean while seeing such an Issue pours out but very little ichor, it is as unprofitable as troublesome.

Idem.

III. The general end of Issues is the evacuation of the matter offending and daily accreving; which evacuation is not to be simply considered, but inasmuch as it does withal either derive, or intercept, or revel the matter. By revulsion the matter is vomited out on this wise: If it be bred in the Liver, or Spleen, or Womb, and tend upwards, we may make an Issue in the Thigh or Leg, always observing to make it on the same side, and hereby is the matter hindered from defiling the upper Parts. Where we must note, that if from the same Parts the matter be sent downwards and possess it self of either the right or left Leg, those do ill that make Issues in the upper Parts to revel from the lower, although they observe the rectitude; for so they draw back the malignant matter, offending either in quantity or quality, to the upper Parts, not without hurt. *Aquapendent*, p. 1. *Oper. Chirurg. cap. 95.* when the Foot was swelled, made an Issue above the Knee, which besides that it revels, does moreover intercept the matter, and stops its course so that it cannot fall down to the Foot: And I following his steps have cured many of a Swelling in their Feet, especially if it were about the ankle, by making an Issue in their Leg below the Knee, and such Patients continue very well still. But I must observe that in Men I alwayes chose the outside, and in Women the inside, because of their Womb.

Glandorph Gazoph. c. 15.

IV. Before they be dried up, there are to be consider'd the Age, the constitution of the Body, the matter offending, the Part sending and the Part receiving. If an Infant be troubled with the Falling Sickness (for instance) and an Issue be made in the nape of the Neck, a regular Diet be withal prescribed the Nurse, and fitting Medicines given, whereby the fuel of the Disease may be substracted and the Head strengthened, so that there be no suspicion of the return of the Malady for a year together, the Issue may be safely closed up, lest if it be kept any longer open, the good juices flow out as well as the bad, and the Part be more debilitated. In a man of middle Age his present state is to be compared with the by-past; which if it be become better, and, while the Issue has run, he have not suffered a relapse, it may by little and little be obliterated in the nape of the Neck or in the forehead of the Head, by lessening the Pill by degrees, making a new one in the Arm for security, which also after a while may be dried up. But let old Men wear them to the last, those namely whose natural heat is weak, and in whom there flows out plenty of matter. We must consider also in Women with Child whether the innate Heat be so brisk as altogether to consume the Morbifick matter;

ter; or whether the offending matter find some other way. From all which we may infer, that there is no definite time of wearing an Issue, and that Death does not always follow closing of them up. If any object the Authority of *Crato*, who affirms, that Death hath followed upon closing up of Fontanels, let him know that *Crato* speaks of that drying up which depends, not upon the defect of matter, but the force of the expulsive Faculty, which is not so strong as before; whence the matter being shut up in the *Viscera* causes Death itself: but it is otherwise if it be dried up either by Art, or by Nature's not breeding that matter any longer which used to be thrown off by the Issue.

V. One being very long afflicted with a Pain in his Loins, at length died: Amongst other Remedies a little before his Death a Cautey had been affixed to his Thigh four fingers above his Knee; from which upon separating the Eschar, there flow'd about half an Ounce of a certain *Sanies*, and afterwards every day an Ounce or more of true and laudable Pus or matter. When he was dead his Lungs were found Purulent; there was a great abscess in his Loins, from which there was found a small chanel reaching even to the Issue in his Thigh, through which part of the matter had flow'd out. Here does Nature's cunning appear which formed that duct for Purging out the matter of the abscess, which yet she could not go through with, being overcome by the plenty of matter.

Another being past Sixty years old, was so grievously troubled with Obstructions of the *Viscera*, that even his Abdomen and Thighs were extended with a Phlegmatick tumour; with Thirst, loathing of Meat and other Symptoms. The best Diet being prescribed him, and his Body being prepared and also sometimes purged with Rheubarb, Senna, &c. Strengtheners being added, at length with a potential Cautey we made him an Issue in the right Ham; from whence serous Humours flow'd so plentifully that he recover'd beyond all hope: for Nature discharged the excrementitious Humours to the Issue as to a common Sink.

VI. A Cautey or Issue in the *Sinciput* or fore-part of the Head is profitable for many Diseases, especially in those who have this Part not Membranous but Bony, that is the fit place where the tip of the middle finger will end if you lay the root of your Hand to the end of your Nose, according to *Mesue*, not betwixt the Eye-brows (as commonly) as *Zacutus* consult. admonishes. 1. If the Surgeon be doubtful, it is better to make it a little higher, as *Aquapendent* bids: The Cautey is not to be made beyond the *Pericranium*; it is enough if it be touched, or only just perforated without going further, namely by taking away the *lamina*, which *Albucasis* bids us avoid. An actual Cautey is always safer than a potential one. 2. Practitioners disallow an Issue in the *occiput* or hinder part of the Head, because it can hardly be kept open or the Pease kept in: the true place is the nape of the Neck, where the Head is joined to the first *Vertebra*. 3. In the Neck the fittest place, according to *Aquapendent*, is betwixt the first and second *Vertebra*; others chuse the space betwixt the second and third. Let it not be made on the Process of the *Vertebra*, nor on either side, but just in the middle. 4. They are made more commodiously and profitably on the inside of the Arm than the outside: the proper place is betwixt the *deltoides* Muscle and the *biceps* where the cephalick Vein runs; because there it may be seen and come at, it is betwixt the Muscles, and is near the cephalick Vein, which circumstances fail if it be made in an uncouth place. 5. Issues are usually wore above the Knee, both on the inside and outside of the Thigh, about an hands breadth above the Knee: when they are made on the outside, it must be betwixt the extending and bending Muscle of

the Leg; when on the inside, betwixt the extending Muscle, the *vastus internus* and adduct. The outside is to be quite rejected for the broad tendon that is there spread under the Skin, which being hurt, as *Aquapendent* and *Hildanus* testify, grievous Symptoms follow: the inside is more profitable because of the Crural Vein descending that way. 6. In the Leg they are made in three places: *Spigelius* in the *Sciatica* made one in the hinder-side of the Calf with good success, because the *Vena Poplitea* runs that way: The internal place is three fingers breadth under the Knee: this is very commodious for Women in regard of the *Saphena*; but less fit for Men, because of Riding: for the outside is better for these betwixt the *fibula* and *tibia* in the interstice of the Muscles, where there is a Vein, though not so plain as on the inside.

VII. Observe these conditions in making an Issue: 1. Let it be made in a place which may be seen, order'd and kept clean by the Patient; chiefly in the Limbs. 2. Let it be near the larger Veins or their branches, not upon them. 3. Let it not be made upon the very body of the Muscle whether its tendinous or carnosus Part, but in the interstices of the Muscles; that the Humours flowing that way may be the more easily evacuated. 4. Chuse a place fit for ligature.

VIII. 1. The Ears being bored supply the place of a Fontanel evacuating from the whole: Nature hath pointed the way as it were with her finger. Some have a little hole in the lobe for Ear-rings. There is a wonderful consent of the lobe of the Ear with the rest of the Body, whether through small Nerves, or by small Arteries from the *Carotides*, or Veins from the Jugulars. If in the greatest heat you sprinkle the lobe with cold water, you will perceive the whole Body to be cooled. In *Egypt*, as *Alpinus* testifies, the scarifying of the Ears is common. Having perforated the lobe of the Ear, put a longish tent into the hole made of the bark of the root of spurge Laurel, turning the inside of the bark outwards and rolling it up round. Let this tent abide therein till the Ear and the neighbouring Parts begin to swell: then let the tent be lightly moved, that the store of Water that is collected may flow out, which being exhausted, the swelling of the Ear will fall, and the Ophthalmie be asswaged. ¶ One will hardly believe how great a deal of serous Humour we have often seen to be drained out by such holes as these, so that that quantity could hardly flow out by a Seton in ten days, which has sometimes run out by these Emissaries. Nor have we seen this Remedy of much avail in Fluxions upon the Eyes only, but also upon the inferior Parts, especially the external, as the Breast, Teeth, Joints, &c. and I have seen many cured by it of an imminent *Phthisis* from a thin and sharp distillation; others also of inveterate Head-achs: and I think it a Remedy deserving to be recalled into use by Practitioners in both averting and evacuating Fluxions. Let the hole be made with a threesquare Bodkin, and putting in pieces of the root of wild Olive (or the like) afterwards cover them over with *Emplastr. Diachylon cum Gummi*, and change them twice or thrice a day, if there be occasion, like a common Seton, for a long time together.

2. *Zacutus Prax. admir. lib. 2. Obs. 160.* applies a Cautey behind the Ears, and commends it for all distillations from the Head; the same is commended by *Riverius* also in Fluxions of the Eyes.

3. There is a new place found out by some in the Neck near the Jugular Veins, in an interstice of the Muscles: by the help whereof an inveterate hoarseness was cured in two.

4. Fontanels are very good in the Back, not only for Diseases of the Head, by deriving and evacuating

evacuating the morbiſick matter; but moreover for the Gout, Stone and Colick, by anticipating the fuel of the Diſeaſe, and intercepting it as it is paſſing to its neſts. Which indeed is made good by Experiments and Obſervations taken from the relief the diſeaſed have had thereby. Cauteries between the Shoulder blades are made great uſe of at this day by our Practitioners. None has uſed to make Cauteries on the Back, nor does any uſe to go further than the third or fourth vertebra of the Neck: yet I knew a man, who eſcaped from the fear of a Phthiſis by making an Iſſue in his Back betwixt the firſt and ſecond Vertebra thereof. They were uſual with the famous Theodore de Mayerne, who made them over againſt the upper corner of the Shoulder blade, at the middle diſtance betwixt that and the Spine; commanding five, ſix or more Peaſe to be put in it, which a ſticking Plafter was to keep in. The moſt illuſtrious Seguere, Chancellor of France, that liv'd to above Ninety, lengthen'd out his life by the help of theſe, putting an heap of Peaſe in every hole.

5. This is now much in uſe amongſt us: Make two Iſſues in the hinder part of the Neck, beſide the fourth and fifth Vertebra thereof, ſo that the Spine be betwixt them, and both may be ſerved with one Plafter.

6. Amatus Luſit. hath propoſed an Iſſue to be made in the hollow of the Arm pits. * Tho. Fienus in curing the Plague made two in each Arm pit. A Young man about twenty being troubled with a Fluxion upon his Lungs, threatening a Phthiſis, amongſt many other Remedies found the chief to be an Iſſue made in each Arm-hole, which within a Month recover'd him by deriving powerfully the Fluxions ſliding down to the Breſt, and the Humours contained therein.

7. For Diſeaſes of the Breſt Iſſues between the Shoulder blades, alſo in the Arm, or Leg, are good, to evacuate or anticipate the Humours that are flowing towards the Lungs, as alſo to call out thoſe that are already depoſited there. We know by Experience how an Iſſue made in the thorax it ſelf between the Ribs doth ſometimes more immediately derive the ſtabiſick matter from the Lungs. Aquapendent commands to make two Iſſues in the hollow under the middle of the Collar-bones againſt deſtillations upon the Breſt.

8. The region of the Abdomen ſeems unfit for the wearing an Iſſue in any part of it; yet ſome mens Practice (though more rare) is much cried up for all Hypochondriack Maladies, who by a Cautery burn a large Fontanel that will hold many Peaſe, above the region of the Liver. I have known this done in ſome with no great benefit, however not ſo great as might recompence for the trouble of ſuch a Remedy.

9. By an Iſſue in the Groin I have ſometimes happily cured a great Lumbago or pain in the Loins, that would yield to no other Remedy; and in another an inveterate Sciatica. For the glandulous Emunctories that are in that place do imbibe very many Recrements of the Blood and nervous Liquor, which if they be forthwith and continually ſent from them by a fit emiſſary, muſt needs contribute much to free the neighbouring Parts from any Morbiſick Matter. Such have Iſſues made in the Groin as are not Married, and ſuch as are well in years: Gul. de Saliceto approved of them for the Colick and Pains of the Bladder; Jac. Fontanus, for the Gout; Santorellus, for a ſtubborn Itch: the Hydrotical and Cachectick have found great benefit thereby. I have put a Pill in many ulcerated with Venereal Bubo's that were now healing up, for a peculiar drain to an infeſted Liver, which being kept in a long time did much good.

10. Four fingers breadth below the Groin an Iſſue being made in the middle line of the Thigh is very good for curing the ſame Diſtempers: For through

the middle of thoſe Muſcles on their outſide, there run down notable Veins, whoſe twigs upon occaſion may eaſily vomit out whatſoever is ſuperfluous above in the Body. Placentinus made an Iſſue in Monks (for the hurts which happen from continual kneeling) on the inſide of the Thigh, two or three fingers breadth below the Groin, in the interſtice of the Muſcles, near where the crural Vein is.

11. I have experienced in my ſelf, that an Iſſue made in the Calf, betwixt the Heads of the Gastrocnemius Muſcle, does greatly mitigate Pains in the Hip. Spigelius indeed commends the making of an Iſſue in the Calf at the meeting of the Heads of the Gastrocnemius: but becauſe this place becauſe of its declivity is very inconvenient to be tyed, I choſe (according to Veſalius) a place a little higher, and there made an Iſſue, not without reaſon, for this Iſſue has all the conditions of a good one, 1. The Vena Poplitea near it, which both the Ancients and Moderns uſe to open with good ſucceſs in the Sciatica, and many other Diſeaſes; 2. It has the interſtice of the Heads of the Gastrocnemius, and there is no fear of hurting that pretty remarkable Nerve that runs under the Knee; for where the Iſſue is made, the Nerve in its deſcent has already ſunk deeper; 3. It has a firm place for the ligature; 4. It has the convenience that the Patient can order and dreſs it himſelf.

12. One may uſe a Cautery for a perfect Sciatica, in the bending of the Buttocks, at the extremity of the muſculi glutæi, (where the motion of the Thigh bone is perceived above the joynt,) when the Humour is contained in the cavity of the articulation.

13. Sometimes for averting fluxions upon the Thigh, an Iſſue is made upon the Loins on each ſide the Spine.

14. Under the Knee it wants all danger, if it be rightly made: the joynting of the fibula with the tibia muſt be ſhuned, where there goes forth a very ſtrong ligament, which being touched by the Cauſtick cauſeth great pain.

IX. The Lobe of the Ear, as was ſaid before, has a notable conſent with the reſt of the Body. It is perforated without hurt, and becauſe of the Carotid Arteries and Jugular Veins, the Veſſels of the Head that creep through the Cheeks and Gums, ſuch perforation is good in Diſeaſes not only of the Head but of the Eyes and Teeth alſo. Valleſus ſaw ſome Empiricks burn with a Cautery in Perſons troubled with the Sciatica, the inner part of the Auricle, where the Cartilage folded back as it were makes a kind of tumour, ſome of whom received help thereby: He gives the reaſon, becauſe in many Iſchiadick Perſons the matter flows from the Head, and is intercepted by the inuſtion of that place. He learn'd the ſame of the Saracens. For a periodical pain in the Teeth Spigelius knew no readier Remedy than with an hot Iron to cut that part of the Anthelix, which above the concha immediately touches the upper part of the tragus, and then to heal up the Wound again. Bartholine ſayes it is a ſingular Remedy for an ophthalmy.

X. It is vulgarly queſtion'd whether an actual cautery may be applied to the ſinciput without prejudice. Answer. Though very grave Authors ſuſpect the uſe of fontanels at the meeting of the coronal and ſagittal ſutures, which the Greeks call βέρυμα: yet becauſe many as well as my ſelf, from the frequent experience of a good ſucceſs, do much commend it for the curing of the ſtubborn diſtempers of the head chiefly; and ſeeing J. C. Claudinus, Reſp. med. 3. T. Fienus lib. 3. de cauter. c. 22 and M. A. Severinus pyrot. chir. lib. 2. p. 211 c. 11. have ſufficiently ventilated that queſtion, I will not alium agere, but remitting the Reader to the cited Authors I ſhall paſs to the manner of adminiſtration. For the accurate finding of the Bregma as well later as

Willis.

ancienter Surgeons have invented divers ways, all which *Aquapendent* reckons up, concerning Fontanels in the Coronal suture. For the finding out of the meeting of the Coronal and sagittal suture I join *Avicenna's* and *Celsus's* way together; And having shaved the Hair enough I draw a thread from the middle of one Ear to the other; then another from the top of the Nose to the Crown of the Head: and where the threads do intersect one another and make a cross, there I think the *bregma* to be, or the place for making an Issue. As to the manner of operation, the Surgeon holds a cold cannula or pipe in his left hand, by which he presses strongly upon the Skin being marked with ink, that he may defend the neighbouring parts from the fire, and allay the pain; and with his right hand he thrusts into the cannula a rod of Iron heated red hot, and coming with it to the Skull turns it about until he have made some print with it in the Bone: To hinder the Inflammation of the *pericranium*, (which omitting the turning about of the heated Iron were easy) and to promote the evacuation of the offending matter, (which also is done by little and little through the pores of the Skull) I use that Iron which *Aquapendent* called the hollow and simply incising: With this Iron heated red hot and put in the above named cannula, we make a fontanel at the meeting of the coronal and sagittal suture, not only burning therewith, but also cutting, through the sharpness of the instrument. This hollow instrument, as soon as it has touched the Skull, is so long to be turned about, till it have made a plain print upon it. Many Moderns disapprove of the use of this same Instrument, not only because of the pain which they think it causes, but also for fear of a dangerous Inflammation in the *pericranium*, which might be communicated to the *dura mater* that is spread within the Skull, through the conjunction of the sutures; whence rejecting this hollow one, they make use in its room of one called *Solid and uniform*: But in my opinion the hollow is to be preferred far before the Solid, because this latter may more easily cause the aforesaid inconveniences than the former: I add, that the injection of the sutures that is performed by a solid Iron, proceeds too slowly through the thickness, hardness and density of the Skin of the Head: whereas all the Chirurgical administrations, especially those that are performed with red hot Irons, should be done as quickly as may be. Wherefore our Modern Surgeons deservedly reject burning instruments, not the simply hollow and incising, but those that are starred and toothed; because the former by reason of the star cannot be turn'd about at all; and the latter, because of its teeth, not so readily; wherefore they are unfit to make fontanels in the *bregma*.

XI. For making an Issue we use sometimes an actual cautery inclosed in a case, that the sight of the fire may not affright; sometimes a potential one, whose use is now double, under a solid, or a liquid form. But it is more certainly and speedily performed, if the Skin being raised on each side be divided with a lancet, and a pease be presently put into the interstice or slit, which swelling by the moisture that flows to it, keeps the place always open; for so the fall of the Eschar is not to be tarried for, which uses to be a long time in separating; nor is there any fear lest the caustick being melted should spread it self through a large space of the Skin, whose surface alone while it corrodes, it cannot reach to the depth of the interstice of the muscle.

XII. *Albucasis Chirurg. part. 1. cap. 1.* comparing an actual and a potential Cautery in general, prefers the actual; because fire is simple, whose action reacheth no further than to the part that is cauterized, and hurteth not considerably any other member that is joined to it; but a Caustick

Medicin runs about and takes up a larger space. These things some apply to fontanels, and prefer actual cauteries. As for my self, I only admit these in those places wherein we would both evacuate and strengthen, as in pains of the Hip: but in those places that are only to be debilitated, I prefer Potential. ¶ That my opinion drawn from experience and reason may be known, I confess freely, that I had rather have six Issues made in my Body with an actual fire than one with a Potential, and I have tried both: and all the Issues I have made these fourteen years, except two, were either made by an actual cautery, or by Section. For an actual Cautery causes more fear than pain, and a potential the contrary: Besides, the Eschar from an actual falls off on the third, or on the fourth day at furthest; but that from a potential sticking more closely is not separated under eight or nine days, as being founded deeper. Moreover by a red hot Iron there is made a round Ulcer and no larger than is desired, and, according to *Celsus*, an Ulcer that is not apt so to heal up: but a Caustick Medicin, though it be very well fenced, does nevertheless communicate its virtue to the neighbouring parts, and makes a broader and deeper Eschar, especially in loose, rare and soft Bodies: so that I am of opinion that potential cauteries were only invented to please, and to take away fear, not that they are safer or better than Actual.

XIII. We must take diligent heed where a potential Cautery is applied, that the Eschar be not burned too large or too deep; for this is not only odious and painful, but also the Issue is made as it were useless thereby; the capillary Veins namely being eat asunder, by which Nature ought to have expelled the offending Humours. Sometimes also the Nervous parts are hurt by the Caustick, if it have made a deep Eschar, for hence there follows a great and continual pain, and other Symptoms: And if an Artery or Vein be withal eat asunder by the Caustick, there follows both a great and dangerous Hemorrhage; which I have seen in one in whom the Caustick had gnawn asunder the Cephalick branch, from whence some pounds of Blood issued. We must take heed also that by melting, it spread not too far: If the Eschar be too broad and deep, when the Ulcer closes up, the Mouths of the capillary Veins are stopp'd with a *callus*, and the Issue becomes less fit and profitable.

XIV. Potential Cauteries, if they be imprudently applied, introduce pain and other Symptoms. An Apothecary having applied a Caustick himself under his right Knee, not knowing the true place, was taken a little after the application, with a cruel pain, Inflammation, Fever, with fear of Convulsion: healing up this Ulcer, we made another Issue, which as yet he keeps open with benefit.

XV. When I advise to make Issues with Causticks, I take care that they eat so deep as till they have fretted asunder the Membrane of the subjacent Muscle. As for example, such as have painful Ulcers in their Feet from the incursion of an acrimonious matter; to stop this incursion I make an Issue by a Caustick in the Leg a little below the gartering place, at which the matter as it glides down is spued out: but, as I said, I see that the investing Membrane of the subjacent Muscle be penetrated, lest the acrimonious matter glide down into the Feet the way that it is us'd to do, viz. betwixt the Membrane and Flesh: and after the Membrane is eaten asunder, care must be taken that it close not up again together with the Flesh; for in vain should a Man be troubled with an Issue without benefit.

XVI. I admonish that none be deceived with the Malady and misery of the receiving Member, making an Issue near it while the Humour comes from elsewhere: but we should always inquire

out the original of the fluxion, and there apply the Remedy: Otherwise it muſt needs cauſe a greater or a new evil; for this is the chief indication of this Remedy, namely, that it may readily purge out the matter that is apt for fluxion, by a region that is diſtant from that part to which it is prejudicial.

Merc. de
Ind. Med.
l. 1. c. 16.

XVII. It ſhould be none of our leaſt cares to ſee, that the Perſon who is to have the Iſſue made, be not Cachectick, that is, be not of a corrupt habit, or vitiated *viſcera*; moreover, that he be not full of ill Humours and unpurged: for in ſuch Bodies this Remedy is apt to produce Malignant Ulcers.

Sev. Medic.
effic. p. 256.

XVIII. Some in England are ſtiff of opinion, that an Iſſue, whether one or more, diſpoſes to Barrenneſs; on which account married Women and ſuch as deſire Children are ſtrictly forbid the uſe of this Remedy, though it might otherwiſe conduce never ſo much to their health: for which interdict yet no reaſon is given, but only ſome ſtories of certain Barren Women that had Iſſues are alledged, when it were as eaſie to relate more that have been Barren without them, and many fruitful with them. And indeed I am wont to retort this argument chiefly againſt that opinion, ſeeing there is no need to confute it otherwiſe.

Willis.

XIX. A Woman having for many years one foot very much ulcerated, had an Iſſue in the other: being wearied with the trouble of them, ſhe got them healed up; upon which preſently enſued a difficulty of breathing, yet without loſs of appetite: At length there followed a ſwelling of the Face, and of the whole Body through the Humours ſtagnating and having no vent, and a little after death. Being opened, there was found an abſceſs in the left ſide hard by the Spleen.

Horſb. obſ.
15. Lib. 9.

XX. As *luxuriant fleſh* ſometimes grows on diſmembred Limbs, ſo alſo in the cavity of Iſſues: nor muſt we believe that that mucor or proud fleſh, as 'tis commonly called, proceeds from the excrementitious Humour that we would have evacuated; but that Humour is turned into ſuch matter, which if the part were intire, would paſs into its nourishment: And hence ſome wear Iſſues without any benefit.

Hoeſer. Her.
Medic. lib. 1.
cap. 4.

Sometimes it happens that an Iſſue, like a ſpring dried up, pours forth little or no Humour, either becauſe the hole being not deep enough penetrates not through the whole Skin, which is eaſily cured by making it deeper; or the Ulcer, though deep and large enough, yet remains without liquor, becauſe the *Serum*, through the too ſtriſt compages of the Blood, does not eaſily and plentifully enough ſeparate from its maſs; and then the only Remedy is, to wear in the hole ſuch ſolid things as irritate much and notably twitch the mouths of the Veſſels. For which purpoſe Pills of Ivy, or Box, or of the Roots of Gentian or Hermodaſtyls are made and uſed with good ſucceſs.

Willis.

XXI. Where a Cautey is applied to attraſt the matter creeping upwards, as in a ſympathick Epilepſie, after the falling of the Eſchar let a Cupping-glaſs be often applied.

River. Pract.
lib. 1. c. 7.

XXII. Having premiſed ſuch things as were neceſſary, I applied a Seton and a potential Cautey to a man of ſixty that was troubled with an old and great pain in his Head: Four dayes after a Phlegmatick tumour roſe in his Arm, which waxed ſo that all his Arm ſwelled from his Shoulder to his Fingers ends, like the Legs of Hydropical Perſons. I uſed Remedies to prevent the extinction of his natural heat: and at length the ſwelling was quite ſcattered. Twelve dayes after, the like tumour ſeiz'd upon the ſame Parts, which afterwards waſted away in a good part, though not wholly. Many were of opinion that theſe things happened by reaſon of the Cautey's being applied upon ſome Nerve; but it appears by Anatomy

that they were miſtaken, for the Nerves lie deeper there than to be toucht by a Cauſtick; moreover it was not laid upon the tendon of the *deltoides Muſcle*, but much higher. After three Months, his Arm being ſwelled like the Legs of Perſons in a Dropſie, he died of a lingering Fever. There was no Gangrene, lividneſs or pain, except a little lumpiſhneſs. But I refer the cauſe of the ſwelling of the Arm to an hard, inveterate, immoveable, painleſs and livid *Scirrhus* that lay hid in his Arm-pit and was faſten'd to the Ribs, and not to the application of the Cautey; though I doubt not but his death was in ſome manner haſten'd thereby.

Cl. Chaphu-
ſius ad Fabr.
Hild. Cent. 4.
obſ. 73.

XXIII. In preparing Cauſticks this one thing is to be noted, that thoſe things be made uſe of that want an aſtringent vertue, ſuch as is quick lime: for thoſe Cauſticks that are made of Vitriol and the like, ſeeing they have an aſtringent vertue, the Eſchar that is made by them is longer a falling off: wherefore we ſhould rather uſe theſe where we would ſtanch the Blood that burſts forth upon the eroſion of Veſſels.

Mich. Ga-
vaſſetius l.
de nat. cau-
ter. c. 12.

XXIV. Sometimes there has riſen a ſpontaneous Ulcer in the interſtices of the Muſcles and in the cavities of other Parts, which hath helped and removed ſome great Diſtemper of the Body: In that place therefore there is to be left an Iſſue for ſome time. 'Tis a thing which I have experienced to be profitable and therefore I adviſe it, yea and reaſon it ſelf alſo perſwades it.

Sever. Med.
effic. p. 235.

XXV. If the Body be foul, and full of Humours, an Iſſue is not to be made, till proviſion be firſt made againſt the accidents that uſe to happen, by ſome general Remedies; for grievous things are ſometimes raiſed from a ſmall cauſe. There is a late example at hand. In the middle of April, 1681. *Conſtantine M.* our chief Gardener, being about Sixty, came to aſk my advice; I am afraid, ſays he, I ſhall fall into an Apoplexy, for I have a heavy pain on the left ſide of my Head with drowzineſs, yea and my Tongue ſometimes faulters, and therefore I think I have need of an Iſſue. I conſented, if neceſſaries had preceeded, left there ſhould be a haſty irruption of Humours upon the part where in it ſhould be made. He replies, that it was not long ſince he had been purged: and ſo goes outright to a Surgeon. The next day a flux of Humour fell upon his Lungs and upon that Arm to which the Cauſtick had been applied, hereto ſent a Loofneſs joyn it ſelf with a Fever. I being ſent for ſaid that the fluor was to be let alone, and that there was no thinking of Bleeding (which he preſt for) until his Loofneſs were ſtayed: yet he ſlighted my advice, and made himſelf be let Blood in the other Arm, which came forth corrupt and putrid, altogether like to that which is taken from Peripneumonick and Pleuritick Perſons, to wit, cover'd with a white greeniſh and thick Mucilage. He refus'd Clyſters which I would have had him uſe to recal the fluor: He was let Blood again, and the Blood was no better than the former: I was afraid his Arm ſhould Gangrene, but a third Bleeding averted the danger of that, as alſo of the Peripneumonie. The Patient accuſed the Surgeon of unſkilfulneſs, that he had not applied the Cauſtick according to art: I pronounced him free from blame, declaring that the Iſſue was made in a fit place, and that no Nerve run that way: and that if his Body had in the firſt place been freed from the load of Humours, he might have avoided that miſchief. Moreover that it was better that part of the Humours had faln upon the Arm, for otherwiſe they had doubtleſs all faln upon his Lungs, which would have been more dangerous. To his ſwelled Arm, omitting thoſe oils which the Surgeon had uſed, the duſt of Barley and millet flour was applied, upon which the ſwelling abſwaged. In a like caſe *Amatus Luſitanus* diſallows Bleeding

ing in the opposite Arm, and advises it to be in the Foot of the same Side: but in this case the reliques of an *Erysipelas* did hinder that, which he had been troubled with a few dayes before: And the imminent Peripneumony, that the Lungs might be emptied, perswaded no other evacuation to be made but out of the Arm. See Book II. tit. *Brachiorum affect.* or of the Distempers of the Arms, and § XXII. before.

XXVI. Now a dayes we do not use perforated *forpices* and a red hot Needle to make a *Seton*; but having shaved off the Hair, if need be, and pitch'd upon a place, and having noted lengthways and sideways of the *vertebrae* where the perforation is to be made, the doubled Skin is held up by one Hand of the Servant and another of the Master, and is run through with the point of a strong Lancer, and a Linnen or Silken Skein, which we ordinarily use, is forthwith drawn through the hole: this is afterwards to be anointed with a digestive Medicine in that part that is to lie hid under the skin, and is often to be pull'd this way and that way.

XXVII. Concerning the *Nape of the Neck*, we must be very careful that in making Setons there, we hurt not the Tendons: For I knew a Captain that had a continual pain in this place from having these Tendons hurt with a Seton, though it cured him however of a Distemper in his Eyes.

XXVIII. *Hildanus* (cent. 1. obs. 40.) bids make a Seton with a cold Iron and not an hot; and thinks the former better, because fire does not only dry the part, but causes both pain and terrour to the Patient: But seeing the dryness that is caused by the fire is corrected with fresh Butter, and moreover seeing the heat and an indifferent pain avail much to the attraction of the offending Humours, and that Patients are as much afraid of cutting as burning; neglecting the reasons of *Hildanus* I have with good success (especially in the *gutta serena*) burned Setons in many Patients, which evacuate the Humours that fill the Head, reveal those that are rushing to the Eyes, derive those that flow to the parts of the mouth and to the Breast, and intercept those that are destilling to the Spinal marrow and the joints of the Limbs.

XXIX. In children I prefer a Seton before a Fontanel, because seeing these are restless, the peace is ever and anon falling out, so that it soon closes up: To prevent which, Nurses commonly tie their heads strait round with a fillet; from which strait tying, seeing the Skull in children is soft and cartilaginous, it is compressed and hindred to grow breadth ways, whence from round or globous it is made long, and the same vicious shape is imprinted upon the Brain also, whereby the Natural and Animal actions are depraved. *Hildanus* confirms this with an example, obs. 4. cent. 6. See him also cent. 1. obs. 42.

XXX. *Paracelsus* l. 9. c. 24. would have the wound made lengthways in making a Seton, that the matters may be readilier evacuated through the streightness of the fibres; to whom *Duretus* consents: *Aquapendent* opposes them, 1. because the Skin cannot be taken up and perforated transversely; 2. because the upper orifice would do no service: Being inclined by these reasons, I am of opinion, that the Skin should either be perforated transversely, or else be taken up and run through obliquely, so that one hole may be higher than the other, because the ducts of the fibres succour each hole, and an happier evacuation is expected from both sides. But the hole is to be higher up on that side where the malady is most urgent.

XXXI. Let the bandage of your Issues be moderately tyed; for a looser bandage keeps not the pill in the Issue, and a too strait one presses out all the moisture, and causes the Issue to become quite

dry through the compression of the Vessels. I knew a Lady that wore an Issue in her left Arm for many years with very good benefit, and when it ceased to discharge moisture, she advis'd with me what should be the cause of its dryness, and how it might be helpt? Loosing the bandage I found the place of the Issue so compressed, that there seemed to be nothing but Skin and Bone: wherefore I ascribed the dryness to the strait ligation, and advis'd that leaving off the fillet wholly, she should dress the Issue twice a day and lay some sticking Plaster over the usual one, to keep in the pill, till the withered part should be nourished again, and acquire its Natural thickness. She obeyed my counsel, and the Issue began to run very much again.

XXXII. The Thigh is a Bulky part, & seems fit enough for having many and large Issues made in it, which namely may drain Humours from the whole Body: But yet it succeeds not so well in many; partly because through its shape, which is thick above and smaller below (being withal steep) a bandage cannot conveniently be made upon the Issue to keep in the Pill; and partly because a solution of continuity being made among the courses of several Tendons, it often becomes inflamed and painful; so that it sometimes becomes necessary in a short time to close up again the Issue that was made therein, to take away the trouble of the pain and halting: but in some it happens otherwise and better; because an Inflammation does not always come upon the perforated place, and in such as use to tie their hose above the Knee, the bandage that is made upon it does not slip off.

XXXIII. I am very sorry that *Inuision*, or the *Remedy by fire*, that was so famous and frequent with the Ancients, is left off by our Modern Physicians not without the loss of many Patients Lives; for what Physick does not cure, the Knife does; and what the Knife cures not, the Fire does; and what the Fire cures not, is incurable. For with the greatest success I cure many Diseases by fire, and those desperate, which at this day the Egyptian Physicians do. Alas, why is this sort of Remedy omitted in many grievous Diseases, without cause, seeing it was so successfully used by *Hippocrates*, *Galen*, *Celsus*, *Paulus*, &c.? On the contrary I am wont cheerfully to fly to this miraculous Remedy, although abhorred by our Modern Physicians, and (I call God to witness) I have always found it profitable: but I use it chiefly where there is a cold and moist temperature. *Epiphan. Ferdinand. Hist.* 7. But they made Inuisions, not that Ulcers should be made thereby for a perpetual and continued evacuation, such as are now made by our usual Cauteries, but either for drying, or to call out the matter to the outer Parts, or to intercept it; and they treated them like Burns, and heal'd them up and skinn'd them over as soon as they could: on this manner they healed the greatest Diseases.

At this day the *Chinese*, *Japanese*, &c. undertake to cure almost all Diseases by Inuision. But for this purpose they use not Iron, but *Moxa*, which is made of the downy tops of Mugwort; this they lay upon the part where they would make an Inuision, and setting it on fire, it performs their intention. But they chiefly use it in the Gout. The Reader may find the virtues of those Burns that are made by it, &c. at large in *Wilhel. ten Rhyn's* dissertation of the Gout, part 3. pag. 69. &c. or more briefly in the first Book of this Treatise under the title of *Arthritis*, (or the Gout) where the said Author's discourse is epitomiz'd.

XXXIV. *Vision* either penetrates to the very *pus*, so that it is both burning and cutting; or it is that which is called *Inuision*, that is, a burning that wounds the Skin only and makes a crust, but does not penetrate. By the former burning the *pus* or matter

matter is drawn out as freely as by cutting; but not so by the latter or Inuſion, but there are Blifters raiſed by it, that by them Nature may let out what uſed too be gathered inwardly, or may alſo thruſt out by little and little what is already collected, and ſo clear the inward part. Inuſions are alſo good for drying and ſtrengthening the parts, when they are moiſt and looſe, and ſometimes for ſtopping the way of fluxions, to wit by a *vicatrix* the parts are hardened and conſtringed. Hence when we would draw out *Pus* that lies deep, we uſe ſection: If the *Pus* be not malignant, nor the part ready for putrefaction, then only cutting; but if it be, then a red hot knife which may both cut and burn, becauſe fire reſtrains and extirpates putrefaction: And then only we ſhould uſe inuſion, when the fluxion lies underneath not as yet changed into matter, or there are mucors and laxities of the parts, as of the ligaments in the *Sciatica* and other pains of the Joints; or unleſs it may be when we dare not make ſection, though otherwiſe the Diſeaſe requires it; as *Hippocrates* commands, that in ſuch as are ſuppurated within their Breſt, we ſhould make penetrating ſection, that the *Pus* may flow out; (namely adviſing that which the Diſeaſe calls for) But others are content with inuſions between the Ribs, as fearing the greatneſs of the Remedy, and its difficulty in a weak Patient.

Lib. de int.
Affect.

Vallef. com-
ment. in 5.
Epid. p. 462.

XXXV. The uſion of the Joints that was grown out of uſe, has been reſtored by *M. A. Severinus l. de Effic. Medicin.* and I have ſeen him perform the operation juſt after the ſame manner as *Alpinus* deſcribes it, l. 3. p. 101. namely by a pyramid made of Flax and Cotton: He called it the Arabick uſion becauſe it is familiar not only to the Egyptians, but alſo to the Arabians that live in Tents. This Inuſion is good chiefly in pains of the Joints that are cauſed by a cold and glutinous Humour fixed in them: alſo in Phlegmatick tumours, ariſing up and down the ſurface of the Body, for the ſtubborn matter will yield to no other Remedy. ¶ As to burning with crude Flax and *fungi* (or Toadſtools) becauſe *Hippocrates* hath not taught the manner, it is worth the while to open it: Take crude Flax, and twiſt it cloſe, make it up in the form of a pyramid, ſo as that one end of it (or its baſis) may be broad, and the other narrow and pointed: the largeneſs that the baſis is to be of, may be learned by the largeneſs of the place that is to be burnt by it; (only note that the burning will extend it ſelf ſomewhat further than the baſis of the Pyramid is broad:) ſet the baſis upon the part to be burnt, and ſet fire to the other end, and keep it on till all the matter be conſumed by the fire; for the fire creeping along and coming to the Skin, makes the uſion, and which ſeems wonderful, almoſt inſenſibly and without pain. When the fire is out, *Hippocrates* laid a boil'd Onion upon it, till that which was burnt fell off. Our people apply Butter with a Colewort leaf, and ſo keep the Ulcer open as long as is thought convenient. *Hippocrates* ſometimes uſed *fungi*, of which they make touch-wood to ſtrike fire withal with a ſint: The Egyptians make theſe pyramids of old linnen rags filled with Cotton: The Armenians burn with rags alone tyed cloſe with a thread: All which ways indeed are very good, as I have learned by experience: And they differ only in this, that the more denſe the matter is that receives the fire, and the cloſer it is made up, the deeper burning it makes: Wherefore the matter may be varied with reſpect to the place affected, the age, ſex and temperament.

lib. de affect.

XXXVI. The Ancients made uſions in the Abdomen for the ſake of the Liver, Spleen and Stomach, which have grown out of uſe, ſeeing they are painful and obtain not their ſcope: For they

were made 1. to amend the cold and moiſt *intemperies* of the ſubjacent *viſcera*; but it is not adviſable to correct inveterate *intemperies* ſo haſtily, ſeeing a contrary *intemperies* may be eaſily induced thereby: And then an *intemperies*, diffuſed through the whole ſubſtance of the Liver, will not be amended by a ſmall burn with an Iron; for here-to are to be preferred ſuch fit Medicines as may be had. 2. They were made for the evacuation of vitious Humours: but although there be vitious matter in the *Viſcera*, yet becauſe the *Viſcera* are not contiguous to the *peritonæum*, the matter cannot flow out by the Ulcer that is made by the Iron. As to impoſthumes of the Liver and Spleen in particular, *Aquapendent* writes well, To burn the Skin and the Muſcles, that lie under it, and the *Peritonæum* with a red hot ſharp Iron, and to penetrate with it as far as to the Impoſthume of the Liver and burn it alſo, ſeems to me juſt like killing a Man outright that is almoſt dead already: commending that ſaying of our Maſter's, That in deſperate caſes 'tis better to let our Patients dye than to kill them.

in fine.

XXXVII. 'Tis a queſtion, where there be a Cautery without pain? to which it is rightly answer'd, if we ſpeak comparatively, That there is. For thoſe things that are of greater activity, and forthwith corrupt the part, cauſe little or no pain. Cryſtals of Silver afford ſuch a Cautery, that are made of Silver with *aqua fortis*. Moreover we ſee ſuch a thing in the Body not only outwardly in a Gangrene and mortification, where we may Mechanically and Elegantly as it were conceive ſuch a like cauſtick Salt; but alſo in a painleſs dyſentery, when ſo great an Acrimony comes ſo ſuddenly on the membranous parts, that it forthwith takes away all ſenſe, whence it is then abſolutely mortal.

Cephalicks, or Medicines for the Head.

(See Book 3. Of the Diſeaſes of the Head in general.)

The Contents.

The diſtinction of Cephalicks. I.
Which are thoſe that are called Volatil. II.
Which fixed. III.
Which of a middle nature. IV.
Cautions in their adminiſtration. V.
The hurt of Cephalick Waters, Spirits, &c. VI.

I. Cephalick Remedies reſpect either 1. the Membranes and Nerves, and their irritation, tenſion (which is very conſiderable in the Membranes) and twitching; and theſe are profitable in pains of the Head, Falling-ſickneſs, Tremblings and Convulſive motions; whether they be diſcutients; or demulcents with a Baſamick, Sulphureous vertue, ſuch as are *paregoricks*, Germander, Ground-pine, Vervain, Penny-royal, Betony, Roſemary-flowers, Caſtor, Amber, &c. or inverting, and abſorbing acrimony, as chiefly *Cinnabarines*: whence it appears how theſe very Medicines are good both in the Falling-ſickneſs, and Head-aches, and alſo in pains of the Joints, in Pleuritic pains, and ſo in the pains of any part of the Body: The more correct Opiats belong hither alſo. Or 2. they reſpect the Humours, eſpecially the *Lympha* or Serum, and withal the Spirits and Vapours, or thin Streams; and indeed if theſe exceed in quantity, then Evacuators and diverters, that are endued with a volatil oleous Sulphur, ſuch as are good in Catarrhs and repletion,

G. W. We-
del. de f. m.
ſac. p. 64.

repletion, in the Vertigo, Night-mare, for some sort of Epilepsie, in weakness of Memory, &c. as Peony, wild Thyme, Majoran, &c. but if they fail in their due quantity, then Restorers, Moisteners and diluters, as inwardly, watry Medicines, Liquids, Potions, Decoctions, drinking freely, which are necessary in Madnes, Melancholy, too much watching: if the Humours be acrimonious, thin and salt, then fixers and temperers. Or 3. they respect the Spirits, which failing require Restorers, volatil oleous Balsamicks, in particular, Ambergrise, Apoplectick Waters, distilled Oyls, &c. which are profitable for prevention of the Apoplexy, strengthen the Memory, restore the Planet-struck, &c. But if the Spirits are unruly and too plentiful, if they esuate and are enraged, they are tempered by moisteners, and restorers of the Serum, by acids that restrain rarefaction, nitrous Medicines that promote evaporation, Opiats that tye, as in Madnes and Phrensie: whence they are also good in want of Sleep. Or 4. the vapours or halitus, which being excessive, preternatural and extraneous, (inasmuch as the Blood being too halitious, or infected with a preternatural Sulphur, just as we see in People drunk, makes the Spirits turbulent) are corrected as well by gentle aromatics and strengtheners (such as are vulgarly called Hinderers of Vapours from rising up to the Head, and discussers of them, as Coriander, digesting powders, that help concoction and strengthen the Stomach;) as also by acids, which obtund the Sulphureous and Cholerick Humours, as in Drunkenness: But when these Vapours or halitus fail, then roscid vapours (all which yet is more rightly attributed to the Serum imbued with these qualities) are restored, both by moisteners, whence in burning Fevers it is advisable to prescribe Epithems either of Rose-water only, or Emulsions that notably moisten and cool; and also by such things as breed an halitious Blood, by gentle Aromatics, whence both Sennertus and Simon Pauli advise, and experience her self also bears witness, that want of Sleep in old Men is not so well helped by Opiates alone, or by refrigerating Medicines, as by sweet evaporating ones, and such as are endued with an oleous Sulphur; such as are species diambrae, diamelsbi, and Wine it self, which we have known some use with good success, to the end namely that the Serum may be brought to its proper state, and prevail by a resolvable Sulphur. Or 3. Cephalicks respect the pores of the Brain it self, either by opening of them when they are too much shut and obstructed, or by shutting of them when they are too wide and gaping. The pores of the Brain are opened by volatil Medicines, especially Urinous, if at any time they are depressed and closed up through the plenty of Humours, or by subsidence, compression or other causes, and grant not a free passage to the Spirits, as especially in the Palsie, Apoplexy, loss of Speech, thick Catarrhs, in which Distempers such Medicines as open the pores of the Nerves are of the greatest avail; also in immoderate Sleep and the like Diseases, Lethargy, Sleeping Coma and others; as for instance, the Spirit of Sal Armoniack, with which and the Spirit of the Lilies of the Valley I have cured a number of paralytick Persons: sometimes also discussers are to be added. And when the Pores are too wide, they are closed both by Medicines that increase the Serum in substance, and that bestow on the Blood a gentle resolvable Sulphur, whence they are good and are indicated both in want of Sleep, raging deliriums, Phrensie, and in other intemperatures.

II. Cephalicks Volatils are 1. such as are endued with an Oleous, Aromatick, sweet Sulphur, in one word Balsamicks; as the Leaves and roots of Angelica, the leaves of Rosemary, Majoran, Sage, Rue, the wood Sassafras, &c. and their Spirits, Oyls, and Volatil Oleous Salts. And these are withal Paregorick, and pacifie the irritated mem-

branes, and restore the fainting Spirits; yea they correct also the halitus or vapours, and widen the pores. 2. Urinous Volatils, as the most renowned Spirit of sal Armoniack, the Spirit of Urine, whence the tincture of the Sun and Moon (or Gold and Silver) do almost wholly borrow their vertue. 3. Acid Volatils, as the cephalick striated Spirit of Vitriol; Aqua Apoplectica Mulierum, &c. although these are more fixed as it were. Helmont was almost the first that observed, that Cephalicks commend themselves by their volatil Salt. So also Conserves, Condites and other preparations of Vegetables belong hither.

III. Fixed Cephalicks are either earthy, as Perles, Corals, Cinnabar; or Acid, or Nitrous, or watry diluters; and these are of use to absorb and dilute Acrimonious Humours that irritate the membranes, to bind, doze and pacifie the enraged Spirits, and to procure liberty to the pores, inasmuch as they absorb the Acrimony of the Humours.

IV. Cephalicks of a middle nature consist of these mixed, and are divers: The External are either moisteners and restorers of the Serum, as in melancholy, where (for instance) a decoction of the leaves of Lettuce is in use; or being of thin parts, do penetrate; or are refrigeraters and repellents, as in Hemorrhagies, deliriums, where Acids are also good, &c. or are discussers and evacuator, as sternutatories, apoplegmatisms; or anodynes, as *unguentum anabasin. populeum*; or strengtheners, as *lignum sapientie*, &c. oyl of peaches.

V. There lies a great deal in the right administering of these, and it is to be noted 1. in the manner of administering, Such as alter violently and leave an harm behind them, are either to be omitted, or to be used more sparingly: Thus, the too odoriferous dull the Head, especially where the Head akes and is affected by Vapours, whence Styra, Saffron, Myrrhe also it self, and Coriander not prepared molest the Brain, and by consequence all things that are too vaporous and endued with a preternatural Sulphur, do easily disturb the Spirits, and though indeed they shut the pores, yet they are to be used warily: whence also Opiats belong hither, which being given more heedlessly and frequently, especially in Children, do weaken the Head and render it muddy. So likewise very cold things are to be shunned; for although the Brain do bear well enough repelling frontals, yet care is to be taken that its tone be not vitiated, seeing all cold things are Enemies to the Nerves. In like manner it is never safe to heat and dry too much, for thereby the Spirits are enraged, and the pores are too much dilated; thus by the *confectio anacardina* some have been made mad. So in Topicks (which is Heurnius's caution, *meth. ad pr. l. 2. p. 118.*) we must use those sparingly that manifestly astringe, to which hot things are often added, that the rest may penetrate. 2. Neither moistening, nor too liquating and hot things are to be used in Catarrhs; and where the Brain is filled with Humour: hence in Catarrhs, washings of the Head, yea and baths also have no place at all, and some have been observed to lose their Smelling quite thereby. So those that use hot things (as the oil of Amber) whether inwardly, or outwardly, to anoint the Scalp in Catarrhs, by melting the matter and precipitating it into the Vessels, they often cause a Fever and other greater mischiefs. 3. Also Salts whether alkalis, nitrous or acids are less convenient in Catarrhal affections, for they make the Serum the more fluxile, whence it easily finds a way to the more noble Parts, which holds in general also of the other Parts. 4. Acids are good where the Pores are too full, or the Humours and Spirits too enraged and unbridled, as in soporous affections, Madnes, &c. but they are not so good where the Nerves and Membranes are weak, as in the Palsie, and worse yet

tico.

VI. Cephalick spirituous waters, as also *Aque aurea*, *vite*, and Elixirs are not so very safe, especially when they are taken on an empty Stomach, and, as *Crato* said, they have proved the Waters of Death to many; for they hasten forthwith to the *Viscera*, they harden the Glandules, amongst which the Brain is one, they hasten the Drop-sie and Apoplexy, as I have sometimes observed in Monasteries amongst the Confessors.

Chirurgia infusoria, the manner of its Administration, and Benefit.

IN our time has been brought to light an Operation of Infusion, or a new Clysmatick or sort of Clystering, when through an opened Vein, by putting a small Pipe into the Orifice, there is injected by the help of a Syringe or Bladder some Liquor that is either nourishing, altering, Cardiack or Purging, which passing to the Heart, and afterwards marching through the Arteries and all the habit of the Body, produces the same Effects, but in a shorter time, as if it had been taken in at the Mouth and let down into the Stomach. This Artifice was afterwards amplified by making a transfusion of the Blood of one Dog into the veins of another Dog; yea the Experiment was tryed in two Men, into whose Veins being emptied to some Ounces, was transfused the arterial Blood of a Lamb, who were also better thereupon. Another manner of transfusing Blood was invented out of one man into another. *Joh. van Horne microtechn. Part. I. Pag. 218.* ¶ *J. Jac. Sacks* writes thus concerning the same to the famous *J. D. Maj.* Of what moment the Circulation of the Blood is, says he, the most skilful Industry and Experience of the Experimental College in England does notably teach, which hath found out that Purgers, without ever putting them to the Mouth, do exert their virtues by the help of the circulated Blood: A Pipe is made of the little Bones of Larks thighs, of the shape of those Pipes that are fitted to an Oxes Bladder for injecting Clysters: A purging, or other altering Liquor is put into a small Bladder, especially that of a Carp; then a vein is cut in the Hand, Arm or Thigh with a small hole, and the Liquor is poured into it out of the aforesaid Pipe being thrust into the hole, pressing the Bladder lest the Blood spurt out of the Vein instead of the Liquor's entering into it: When the Liquor is poured in, the Orifice is closed and tyed up: Thus within an hour the Blood is impregnated with the purging Liquor, and communicates the virtues thereof to the Heart by means of the Circulation, and an happy Purgation is effected. The transfusion of Blood out of a mangy Dog into a sound was performed by *M. Thomas Core*, as the Transactions of the English Society in the year 1667. p. 75. relate it: Whereupon there followed no alteration in the sound Dog, but the mangy one in the space of Ten or Fourteen days was perfectly recovered. *Dr. Richard Lower* in his Treatise of the Heart, p. 190. delivers the Method that is to be observed: And the way of preparing the Vein in Man is shewn in the said Transactions from *Dr. Edmund King*, p. 246, &c.

Many things are objected against this Transfusion, but this chiefly, that there is a great difference betwixt the Flesh we feed upon, and the Blood that is transfused immediately into the Veins; that that undergoes great alteration, but this not. To which I answer, That of the three primary Digestions of the Aliment, the first that is performed in the Stomach is of no great moment in respect of the others

that are made of the chyle and Blood in the Heart, Liver, and all the Parts that are capable of nourishment: And although Blood poured in fresh, undergo not the first concoction that is made in the Stomach, yet it undergoes the other two through many Circulations that are performed by the natural Blood, and therefore there is no absurdity to hinder why it should not be transformed into man's substance.

D. Fabricius a Physician of Dantzick, that was greatly desirous to find out what such effects the operation of infusing Liquors into mens Veins had with it, meeting with three fit subjects in the Hospital made these Experiments: First he infused by a Syringe about two Drachms of a laxative Liquor into the *Vena mediana* of the right Arm: The Patient was a strong Souldier, very dangerously clapt, and suffering terrible exostoses or Nodes on the Bones of his Arms: The Cathartick Liquor being poured in he complained of great Pains in his Arms, the Valves wherein did so sensibly swell up, that we were forced by a gentle compression with our finger to straiten the tumour towards the Shoulders of the Patient: After about four hours the Medicine begun to work, not without great disturbance, and it continued its operation the next day, so that he had five large Stools after the infusion. Without the using any other Remedies those exostoses went away, nor remained there any footsteps of the fore-mentioned Disease. The other two Experiments were made the one in a Woman Thirty five years old, and the other in a Girl of Fifteen, that were grievously afflicted with the Falling-Sickness: Both these underwent this operation, whereby we poured into their Veins a laxative Medicine dissolved in an Anti-epileptick Spirit: The first some hours after the Injection had gentle Stools, and the day after her Epileptick Convulsions returned again, but much more gently, and at length they went off: The latter the same day had four Stools, and some the day after, but going abroad and catching cold, and not observing a right Diet, she kill'd herself. It is observable that it was common to all of them to vomit a little while after the Infusion, and that violently and often. The said *Fabricius* having obtained leave to try the Experiment in some that were very much infected with the *Poz*, opened a Vein, and infused into the Blood certain Medicines; which Experiment being made in two, the one recovered and the other dyed. He repeated the same Experiment, pouring altering Medicines into the Veins of the right Arms of three Patients, one whereof had his Limbs distorted with the *Gout*, a second was extremely Apoplectick, the third was brought to Death's door by the Polish *Plica*: The Gouty Person was pretty well the next day, and shortly after betook himself to work, professing himself to be cured: The Apoplectick from that time forward endured no Paroxysm; And many of the Ulcers that arose from the *Plica* were healed, and both these could go about their Business. But the conditions and requisits for this administration, required by the above-mentioned *J. Dan. Maj.* (who hath writ a large Volume of this operation) are 1. That the Physician be warranted by Publick Authority, let the event be what it will: 2. That some regular Remedies have been first used without success. See more in the aforesaid *Philosophical Transactions*.

Clysters.

Clysters.

The Contents.

They draw not only out of the Intestins, but reach further. I.

In what Posture the Patient is to take a Clyster. II.

One may be made drunk by a Clyster. III.

They require some strength of the Faculties. IV.

The too much use of them is to be avoided. V.

Of the four usual forms which is to be chosen, and when. VI.

The Body may be nourished by them. VII.

An indication for the injecting of them is to be taken from the usual going to Stool. VIII.

They are not to be injected cold. IX.

Their virtue in internal Inflammations. X.

Being frequently injected they cause the flux of the Hemorrhoids. XI.

Narcotick Clysters are safe. XII.

But with the addition of Correctives. XIII.

Let not the quantity of the Liquor be too great. XIV.

How to be injected in those that retain them not. XV.

What such they should be in weakness of the Intestins. XVI.

How those should be prepared that we would have to work strongly. XVII.

How to be called out when retained too long. XVIII.

A greater quantity is requisite in Women. XIX.

What Purging Clysters are to be made of. XXI.

They supply the place of Purgatives. XXII.

Stronger Purgatives, when they are boild in them, must be tied up in a Rag. XXIII.

Carminative Clysters are not to be injected all at once in flatulent Distempers. XXIV.

Mix not fat things with Clysters that are to provoke to Stool. XXV.

Emollient Clysters made of the common emollient decoction are often hurtful. XXVI.

Carminative Clysters are hurtful, unless Emollients be added. XXVII.

Tears are not to be added. XXVIII.

Sugar is to be boild in the Clyster, and not only dissolved. XXIX.

Whether Salt be to be put in them. XXX.

We must sometimes abstain from Fenugreek seed. XXXI.

Mercury (the Herb) is not to be reckoned amongst Emollients. XXXII.

The Emollient Herbs (of the Decoction) must be very fresh. XXXIII.

Clysters made of many Simples are hurtful. XXXIV.

When a Purge works not, whether a Clyster is to be administered. XXXV.

Clysters made of the Oil of sweet Almonds only their efficacy in mollifying the Belly. XXXVI.

A Clyster of Tabaco smoak loosening the Belly. XXXVII.

Clysters are not so convenient for Old Men. XXXVIII.

The efficacy of Clysters made of the infusion of Crocus metal-lorum in sundry Diseases. XXXIX.

I. Most deny that their virtue reaches further than the Guts, and therefore if Humours be to be evacuated from any higher or more remote Part, they advise to take Medicines by the mouth: But experience witnesseth that their efficacy is greater than so; for that assures, that the same Symptoms have followed the use of white Hellebore administered by way of Suppository, as if it had been taken by the Mouth; that three Grains of the glass of Antimony put in a Suppository, have caused two Vomits: For the Colon receiving the virtue of the Medicine, transfuses it by the Arteries into the trunk of the Aorta.

II. The most convenient posture for the Patient to take a Clyster in is learned from the situation of the Gut Colon; it begins at the right os Ilium; from whence ascending it joyns it self to the right Kidney: from thence bending it runs across the Belly to the left side under the hollow side of the Liver and under the Stomach, and so comes to the left Kidney, to which it is likewise joyned: then descending to the left os Ilium, it ascends again by and by towards the upper Parts, but after a short space bending down again, it begins the straight Gut: Let the Patient therefore be placed on the right side, left if he should be placed on the left, the weight of the Viscera should press together the straight Gut and the last part of the Colon (that descends under the Spleen and is knit to the left Kidney) so that the passage of the Clyster into the capacity of the Colon should be hindered, and it should stay all of it in the two lower windings of the Colon; where it will but stay neither for a short while: but if the Patient lean on his right side, the liquor will be easily driven to the bending of the Colon under the Spleen, and so proceed forward to the Valve at the beginning of the Colon.

III. I have seen an abstemious Woman drunk by injecting a Clyster of Wine, which those that were by not knowing, believed that some mistake was made either by the Physician or Apothecary. I saw the like in the year 1658. at Newenburg in a Noble Matron, who being troubled with the wind-Colick, and having a Clyster given her against wind which had a spoonful of Aqua vite in it (a lenient Clyster preceding) fell into a Melancholick Delirium: She forthwith caused all her Relations to be called to bid them the last farewell, affirming that her end was at hand: They all dissolved into tears; but I being satisfied there was no danger from the strength of her Voice and all her Faculties, burst out into laughter: And indeed in two hours time she was freed of both her Colick and Delirium, nothing remaining but Shame for her vain fear.

IV. Hippocr. lib. de v. r. in Ac. for the use of a Clyster requires that the Faculty be strong, and the Age firm: Indeed the Ancients used stronger Clysters; I mean such as were prepared of stronger Medicines, and were wont to inject far more than now, and therefore required more strength to bear it; and they relied on a Clyster as on a more powerful Remedy: for you may very often see Hippocrates (in Epidemis) to make mention of a Clyster as a most Sovereign Remedy in the difficult Cures.

V. We must diligently note, that we do not continue long to inject Clysters in Fevers, when the strength of the Disease is broken and its edge taken off, especially in hysterical Women or hypochondriacal Men, seeing the Blood and Humours of such Persons are easily transmutable, and are exagitated and estuate with almost nothing, whereby the Oeconomy of the Body is disturbed, and the febrile Symptoms afflict the Patients even beyond the usual Period. We must take heed of using them too much, because they make the Guts sluggish and neglectful of their proper Office: Besides that they draw down the Meat before its due time from the Stomach and Mesaraicks, so that the Party is deprived of nourishment and repletion, whence it comes to pass that those that take Clysters void nothing the next day, and therefore the ignorant vulgar think they bind the Belly.

VI. Seeing 'tis known there are four kinds of Clysters used at this day, of a different shape or form, we must inquire, which of them is the most convenient and safe. The first of the four, described by Hippocrates, is known to all, namely that which is made of an Oxe's Bladder, to which a Pipe made of Ivory or Box is fasten'd; which seeing some, especially Women, are through bash-

fulness unwilling to make use of, another second kind has been invented, which any one may himself alone put into his anus, the invention and description whereof we owe to *Gul. Hildanus Observat. lib. 1. cap. 77.* The third sort was first brought to us from France within these few years, made of Tin, and more like a Syringe than the two already described. The fourth kind, which is the latest of all, was invented by the English, being made of a Skin or Leather, but through which neither is Oil nor any Decoction injected into the anus (for which Uses the three kinds already mentioned are made) but any one that will may puff up the smoak of kindled Tabaco by the blast of his Mouth or upper Throat into the anus or lower Throat (that I may speak with *Plautus*) the accurate Description and Figure whereof the Excellent *Tho. Bartholine (Cent. 6. Histor. 66. Rissor. Anatomic.)* has given us. Now which of these would we commend to such as are afflicted with Colick Pains, especially, if we would not exasperate them? Indeed seeing 'tis observed that all Patients are not eased by Clysters, there is surely some choice of them to be made: I think it therefore most adviseable to use either the first or second sort when we are troubled with the Colick, for these are the fittest for moderating in a convenient quantity, and as it were ruling with our hand as we please, the Decoction that is to be injected: And if the *status* shut up in the *Cæcum intestinum* (which we have determin'd to be the receptacle of *status*) and in the cells of the Colon strive to get out, whilst the Decoction is injected by the Pipe, these *status* may conveniently be received into the Bladder that is now almost emptied of the Decoction; for which purpose it were moreover convenient (for 'tis easie to add something to Inventions) to tie to the Bladder a little Pipe, besides that which is thrust into the anus, whereby the *status* may break forth and vanish into the Air, as the smoak out of a Vent-hole or Chimney, which little Pipe is to be stoppt with a Cock (or the like) till there is occasion to turn the Cock and give vent to the *status*, which sometimes otherwise break forth with that violence into the Bladder (being almost emptied of the Decoction) that if it be not compact enough they break it, and flying out with the Decoction bespatter shamefully the face of him that administers the Clyster; or which, if they find no vent, are driven violently into the Intestines again: which when it happens, without doubt that Pain in the Intestines is exasperated which 'tis desired to assuage by the Clyster, but in vain: but the Belly being extimulated by a Suppository or Clyster, if the *status* find a passage, they go out through the freight Gut according to desire. When therefore any is ill of the Colick, the two kinds of Clysters just now mentioned may be advised. When any one is Sick of the Iliack Passion or *Volvulus*, the French Clyster is to be recommended to him, as whereby the Intestines are far more impetuously distended than by the former, which *Hippocrates* commanded to do, and made tryal with a Pair of common Bellows. As to the profit or Commodity of the English Clyster, I partly suspend my judgment, as thinking it not yet to be clear enough what I should pronounce of it; yet I deny not but that the smoak of Tabaco, being Acrimonious and Narcotick, when it is to be pufft up into the anus should affright many Patients, because of the Vessels of all kinds, Veins, Arteries and Nerves that end in the freight Gut and Sphincter of the Anus (to say nothing of the Bladder that grows so the freight Gut) of which consult Anatomists: What therefore will be done thereby in them who being in years expect both the external and internal Hemorrhoids, whose Anus or Womb is apt to fall out, who Piss in their sleep, or from whom the Seed is prone to issue? Whether may not these Parts mentioned be easily taken with a Palsie, when the Narcotick faculty of the Tabaco hath as it were bid

battel to them? Yet I deny not, though *Nardus Antonicus Recchius (lib. 5. rerum Med. Hist. novæ cap. 51.)* demonstrate Tabaco to be Narcotick, not because it is cold, but because it is hot, of an acrimonious taste, dry and hot in the third degree, and wonderfully drying up Phlegm; I say, for all this, I do not deny but European Women, that are subject to the more grievous Symptoms of the Womb, may by the help of the English Clyster assuage such their uterine Symptoms, putting it into the neck of their Womb and driving the Tabaco smoak into their Womb it self, without making use of that Chair which *Neander* describes in his *Tabacolog.* And the foresaid *Recchius* teacheth, that the smoak of Tabaco, breathed in, is not only a Remedy for them that labour under difficulty of breath, but that the same is exceeding good also for the Distempers of the Womb, and especially for the Suffocations that are wont to happen through its ascent; for by the application of this Remedy it is restored into its place in an instant, swooning and straitness of the Breast are removed, and Death which was in a great measure let into the sick Womens Body, is removed, &c. When therefore 'tis every where directed to fumigate the Womb by a Funnel in certain Distempers, the English Clyster is most to be recommended for that use: Likewise when *Hippocrates* in the *volvulus* or twisting of the Guts does therefore commend the use of a Pair of Bellows, that simple blowing (or wind) may distend the Intestines, and free them from the hard Excrement, no Instrument can be found more ingenious than this English one to distend the Intestines by mere wind, without any Tabaco smoak.

VII. *Laurentius* in his Anatomy discusses the question, whether a Clyster can nourish, and whether any concoctive Faculty is to be granted to the Intestines? But we must believe Experience, and yield to Reason which also consents; for there is the same condition of the Stomach and Guts; their neighbourhood and connexion persuade that. In *Hildanus (Obs. 30. Cent. 4.)* a Matron after a Sickness being on the mending-hand, for six Weeks was so averse from all Meat and Drink, that she could hardly take any thing by her Mouth; but by the advice of *Auberius*, Broth of Flesh, with the yelks of Eggs, was injected in at her Fundament twice every day; and by the help of these Clysters she was so nourished, that being with Child she carried her fetus to the appointed time, and was happily brought to Bed of it. In the year 1660. *Mr. Bourgeois of Neuenburg*, the Governour of the Alms-house, being ill of a Quinsey, and swallowing nothing at all, was by the same means sustained for eight days, till the way for Meat and Drink was opened again.

VIII. In all Clysters 'tis useful to consider mens wont, inasmuch as some go not once to Stool in two or three days or longer; others unless they go once or twice a day, their Head and Belly seem to be loaded: Wherefore according as one uses to go to Stool, or somewhat oftener, must Clysters be given, unless something hinder; as in Children, in whom the retentive Faculty is very weak, and therefore they endure not Clysters often; as neither can Men that have the same Faculty weak, or *Mercatus* the expulsive quick and sensible.

IX. One in a Barber's Shop complains of the fear of an approaching Disease; the Barber offers him his help, and prepares a Clyster, and injects it cold: The poor Man tells him that he's sensible of coldness in his Guts, and intreats him that he will give him an hot Clyster instead of it: the Barber does confidently tell him, that 'twas all one whether 'twas hot or cold: but the event shewed the difference; for being oppressed with a great weakness of his Faculties, he could not void the Clyster again either of himself, nor when provoked by another hot Clyster; and the next day being overcome with an eternal coldness, he died.

dripartit. Bo-
tan. p. 461.

Barthol.
Cent. 1.
Obs. 76.

X. *Adr. Spigelius* boasted that he had found by experience, that Inflammations of the Hypochondres in the Intestines may be digested the same way by Clysters, as external Tumours and Inflammations by Fomentations.

XI. *Vallesius* (5. *Epid.* p. 487.) says, that *Eudemus* of *Larissa* had the flux of the Hemorrhoids begin upon Purgations, because formerly for other Distempers he had used frequent Purgations, or Clysters, or Suppositories: to let us know, that many do deservedly shun their use, for fear of the Hemorrhoids.

River. Pract.
l. 1. c. 11.

XII. *Laudanum Opiatum* used even in Clysters procures Sleep powerfully enough, yea more safely than when given by the Mouth.

Frid. Hofm.
m. m. l. 1.
c. 10.

XIII. *Sennertus* (l. 1. *Pract.* in the Chapter of the *Phrense*) advises, in the greatest weakness of the faculties to mix Opiats with Clysters, when they cannot conveniently be taken in at the Mouth: But Correctives are not to be omitted, such as are the Oyls of Dill, Chamomel, Roses.

Flemp. in
Institur.

XIV. The quantity of the matter of the Clyster is commonly prescribed to fifteen or eighteen ounces, which is often too much, when the Intestines are filled with feces or wind, or the Patient is short of stature, or a little punch-belly; for then seven or eight ounces are enough: but when we inject them for absterision, as in the Dysentery, they may be given in a larger quantity.

Claudinus.

XV. Let Clysters be injected actually cold into those that are prone to part with them again presently.

XVI. In great weakness of the Intestines let the decoctions for Clysters be of broth.

Capivaccius.

XVII. Clysters that should work strongly must consist of a little broth and a good quantity of Electuaries, for so they are longer kept.

Wolf Gabel.
ch. v. Cent. 1.
cur. Annot.
62.

XVIII. If Clysters be too long retained, which often happens, inject three or four ounces of crude Honey with flesh-broth, or one Glass of Urine, and it will certainly bring out with it the former Clyster. ¶ If the Pipe or nozzle of the Syringe by which Clysters are injected, be put up the anus, and the Air be attracted by drawing out the stopple, by this means the wind is not only drawn out, but Clysters that have been too long retained are furthered in their excretion.

Platerus.

XIX. According to *Rufus* in *Oribasius* (8. collig.) the quantity ought always to be larger in Women: for Women are dull, of slow motion and cold: besides they have naturally larger Bellies for the containing of the feces.

Pharm.
Dogm. c. 17.

XX. *Quercetan* commands that there should be ready prepared in the Shops a Carminative oyl of *Coloquintida* that is Purgative; this oyl, he says, may be kept long; the Dose of it is one ounce, or two, accordingly as there is need of its stronger or weaker working, being mixed with fat broth: It would be a Sovereign Remedy against all soporiferous Diseases, Apoplexy, Lethargy, &c. Of the aforesaid *Coloquintida* boiled with lenitive oyls, as oyl of Earth-worms, Linseed, Lilies, Mistletoe-berries and Chamomel, one may make a compound lenitive Purgative oyl after the manner of the aforesaid Carminative Purgative oyl, which being mixed with the broth of a Sheeps Head, is an excellent Remedy against all pains: for the oyl does wonderfully temperate the acrimonious and poisonous quality of the *Coloquintida*, so that being thus prepared it is not hurtful or prejudicial at all to the Guts, to whose coats otherwise, though it be the most finely powdered and made up into Troches, a little is always wont to stick: which inconvenience we prevent by this preparation, and the mixture of oyls with its essence and propriety, and thus it becomes a Remedy less dangerous than *diaphanicon* it self, or *benedicta laxativa*. It will be useful in divers sorts of Clysters, and will exert notable effects with good success, especially in af-

fwaging the intolerable Colick pains that arise for the most part from glassie Phlegm that sticks to the Intestines, in which, Purgings lenitives given alone are found altogether ineffectual and invalid. The description of the first mentioned oyl is this: Take of the dried Herbs of Rue, Calamint, Organy, Penny-royal, of each an handful, of the Seeds of wild Carrot, Cummin, Fennil, Bayberries, of each an ounce, of oyl Olive two pounds, red wine one pound: boil them till the wine be consumed: Into the oyl thus prepared put two ounces of the pulp of *Coloquintida*; digest them by the fire in *Balneo Mariae* for twelve hours, then let them boil two hours, until the oyl have drawn out all the vertue of the *Coloquintida*, then press it and strain it.

XXI. In Clysters there are only two Purgers, *Scammony* and *Coloquintida*; other things are added for the more commodious evacuation: Oyl, that the way may be slippery; fat gemma, for the fusion of the excrements; Carminatives, for wind.

Walaeus
Meth. Med.

XXII. That Clysters may be substituted for Purging Medicines is clear from *Galen* (2. s. loc.) where in the pain of the Head, or a stroak or blow upon it, and in a fluxion upon the Eyes he proposes a strong Purgation, whether it be by giving a Purgative by the Mouth, or by strong Clysters. If two or three ounces of *agua Benedicta* be added, they purge very powerfully: They will become Purgatory also, if one dissolve in them two drachms of some Pills.

XXIII. Strong Purgatives, as Troches of *Agarick*, *Scammony*, *Coloquintida*, when they are boiled in Clysters, must be tied in a rag, lest the thicker matter of them stick to the Intestines and cause griping. Mercurials and Antimonials, seeing they easily settle, and send not forth their thicker parts in boiling, may be boiled without being so tied.

Fr. Hofmanni
m. m. p. 128.

XXIV. We must note in all flatulent Distempers, that Clysters are not to be given all at once, but first of all about a third part; and a while after give the remainder, for so the Patient will retain it the better.

Idem l. 1.
cap. 16.

XXV. To mix oyl or any fat thing with Clysters that are to purge the Guts, as is common, is contrary to all reason, seeing the vertue of irritating Medicines and the faculty of feeling are both of them dulled by nothing more than by oleous Medicines: Wherefore we must abstain from these while we endeavour to excite the sense only, unless when both causes concur to Costiveness; for then it is necessary to use both mixt together, namely such as may soften the excrements, and also others that may irritate the faculty. But when the faculty is dulled by any viscid Humour, and the clearness of sense is lost, so that the Patient is not at all sensible of the weight or acrimony of the Humours, it will be expedient at such time to use those Clysters first that absterge or cleanse, and afterwards those that irritate, that when the impediment is removed, the faculty may be rouzed from Sleep as it were and arise to motion.

Mercat. de
Indicar. Med.
l. 1. c. 3.

XXVI. We must know that fat Clysters, which are called common, made of Mallows, Marsh-Mallows, Beet, Prunes, Linseed, Fenugreek, are not profitable for all, though they are found useful to the most for procuring the usual stools; for by their nidour Womens Wombs are wont to be disturbed: their ill smell also affects some mens Heads, and in others the Mouth of their Stomach; in some likewise it corrupts the Spirits and Humours: hence it came to pass that the Ancients were content with Wine mingled with Honey and with Oyl only, that the stench and unprofitable burthen of Medicines might be avoided; for a thicker substance is not so fit to wash out the feces as what is more liquid.

rer. castigat.
cap. 24.

XXVII. Those things that powerfully discuss, often cause pains through the wrong using of them: for if the flatuous Spirit be dense and thick, and the matter

matter much or more dense than can be conquered by Carminative Medicines, rather more *flatus* are generated by them, and those that were there before are made more thin: and therefore it comes to pass that the distended and pained part is more stretched by the new propagation and attenuation of the *flatus*. Wherefore I think it more adviseable to mix with Carminatives, those things which have a vertue to mollifie the pained parts, that they may be the easlier distended: so that I like not the use of those things at the beginning which are called duscussory, until the Disease be increased, the matter being become thinner and the *flatus* dissolved.

cavel. l. 1.
Comp. Med.
c. 20.

XXIX. White Sugar or brown (which detergeth more) is added to the Clysters called common: But this unless it be boiled a little in the broth or decoction, being turn'd into *flatus* causeth gripes.

XXX. Whether is Salt to be put in Clysters? In Fevers the use of Salt mixt with an absterging decoction is more fitly omitted, especially when Solvents are added; for without Salt they stay longer and are reduced better into act in the Intestins: for Salt is only good in those that cannot endure a Clyster should stay long; or where we would stimulate and irritate the expulsive faculty, if it be dulled.

Zacut. Pr.
Hist. p. 546.

XXXI. I have sometimes observed, that although Fenugreek-seed be indifferently commended to either Sex to loosen a cative Belly, or to ease gripes, being used in Clysters; yet some women are offended with its smell, and especially those that are subject to fits of the Mother: wherefore for the most part I refrain from it in prescribing those Clysters that are appointed for that Sex.

S. Pauli
Quadrup.
Botan. class. 3.

XXXII. Mercury is reckoned by some amongst Emollient herbs, which *Hofman* (following *Marc. Virgilius* and *Brassavolus*) thinks it ought not to be, but he will have it to be put in the rank of indifferent purgers. But commonly, says he, 'tis put in Emollient Clysters? True, but that it may be, though it be no Emollient, but do only help the Emollient action by absterſion: For like Beet, Colewort and such like, it has something nitrous whereby it stimulates the Belly: Hence *Cartes* observes that the leaves of Mercury will do the same thing as the leaves of *Senna*; and hence also it is that Clysters of *mel Mercuriale* have a notable vertue to provoke to stool: therefore 'tis better to use that Honey than the dry leaves.

Lib. 2. de
Medic. offic.
cap. 147.

XXXIII. In making decoctions of Emollient and cooling Herbs, we must see that they be newly gathered. Two years ago upon taking a Clyster in a Fever, whose decoction was made of herbs gathered the day before, I had presently a great pain arise at my Stomach, which was followed by a swooning: Of which I could gather no other reason, than the nidour and stench (ascending up my Guts) that arose from the Herbs that were musty and half rotten.

S. Pauli Qua-
dr. Bot.
p. 398.

XXXIV. As to the manner of composition, it is to be noted that there is no need of any curious composition, seeing the too great variety of Roots, Leaves, Seeds, Flowers and Fruits, to which afterwards oyl and other things are added, makes the Clysters have a bad smell, and so by their nidour they disturb Womens Wombs, and affect also Mens heads and the Mouth of their Stomach, whence at this day we see the most famous Physicians do often profitably prepare Clysters of one Plant or a few Seeds.

Sennert. In-
stit. l. 5.
Part 3. Sect.
3. c. 24.

XXXV. When Purgers do not their office, Practitioners inject a Clyster, neither rightly nor safely, says *Oribasius*; for the Guts being distended

with the Purge, and the Humours rushing thither, the Remedy is forbid entertainment: wherefore, by his advice, it will be better to put up a suppository, made of Honey with half a drachm of Salt, or however let the Clyster be but very little in quantity.

Heurn. m. m.
1. 2. c. 21.

XXXVI. It is almost incredible how effectual Clysters made of the oil of sweet Almonds are against the Colick and *Pareſis*: Yea when strong and irritating Clysters have been given in vain after the Belly has remained obstructed for five or six days, I have often commanded when people have been delirious in the acutest Fevers, to administer nine ounces of that oyl alone in a Clyster, whereby the hard *faeces* being softened and evacuated, the Belly has sometimes been rendred so quick afterwards as if they had drunk Hellebore or other the strongest Purge, yea it has still continued loose, otherwise than it use to do after other Clysters, which (not being fatty) are injected in acute and Malignant Fevers, in all which I think we should obtain from Purgers.

S. Pauli Qua-
drup. Botan.
p. 14.

XXXVII. That Tabaco has a vertue to purge upwards and downwards those experience that against their will swallow its smoake. If the same smoak be puff'd into a glass full of Beer or Wine, it does the same: Hence an ingenious person instead of the decoction for Clysters learned to put this smoak up the fundament, and happily procured stools in all distempers where a Clyster is needful. Let two Pipes be filled with Tabaco after the usual manner, then light them and turn the Mouths of their Heads one upon the other; then put the smaller end of one up the Fundament, and holding the smaller end of the other in your Mouth you may blow the Smoak up into the Guts. By which artifice any one may give himself a Clyster, and there needs not such a potter with Decoctions, seeing by this Smoak Nature seems to be solicited to excretion happily and readily. The Smoaks of other powders also might be injected in this manner according to the necessity of the urgent Diseases in the Guts. *T. Barthol. Cent. 6. Hist. 66.* where also a more convenient instrument is described. A like instrument may be made for the Womb, for modest Maids and Women, that they may themselves, as there is occasion, either purge, alter or strengthen it. *Idem ibid.*

XXXVIII. It is to be remembered here, that Clysters are not wont to have that good success in old Men they have in young, as *Sydenham* (*tract. de febr.*) has observed, on the account that their Nerves being weaker may easily be hurt and resolved by Emollients: Yet that holds not universally, if we regard also the strengthening of the Nerves, and prescribe them not oftner than is fitting.

Wedel. de
comp. med.
ext. p. 90.

XXXIX. Medicines fetched from the Class of Minerals, do far exceed other Purgers that come into the composition of Clysters; whether we would assuage pains raised from cold causes, crudities, *flatus*, Mucilaginous, Tartareous and Gritty Humours; or would expel Worms, draw forth the stinking filthiness and putrefaction of the Humours; or would more strongly purge all Humours, but yet without too much heating, such as is wont to be caused by *Hierk Logadii* or *Pachii*, *diacolocynthis*, *benedicta laxativa* and others of this kind, which most use to rouse up their Patients in comatose and sleepy symptoms and affections, whereas the exceeding heat of these Medicines rather strengthens the Disease, and fills and wearies the Brain with a greater quantity of Vapours rather than lessens them by scattering of them. This happens not in those other Remedies, which being wholly destitute of those manifest and hurtful qualities do put forth rather formal and spiritual effects than material. The Medicine which I speak of is *crocus metallorum*. If any be fearful of these Medicines,

dicines, because he has not tryed them nor understands them, and therefore do not approve of giving them by the Mouth; yet I think he cannot be so stupid, as to be against the giving of them in Clysters, especially if he be acquainted with the very notable effects, which they perform gently indeed, but most sovereignly, and in the mean while give no disturbance, either by the ingrateful smell of oyls, or by any thing else, as for the most part happens in the vulgar Clysters. Their price is also less: for half a drachm or at most a drachm of the before-mentioned Remedy is enough, which is to be steeped in four or five ounces of some convenient Water or Wine for a night or longer; and so mix the clear infusion with some broth in a sufficient quantity to make a Clyster. If you please, you may keep the same infusion (made in Wine or Water) ready prepared, and so make it in a large quantity, increasing the dose of each: This you may keep very long and make use of it, always observing the aforesaid dose. Instead of *crocus metallorum*, though not with so great emolument, you may use *Antimony vitrificated*; which yet being infused, strained and given in Clysters is less prejudicial than *diaphanicon*, and is far more profitable and effectual than that. Experience and daily use recommend such kinds of Clysters. See *Riverii prax. c. de Apopl.* and others.

Dog. c. 17.

Cosmeticks.

The Contents.

The use of them is hurtful. I.

An internal Cosmetick of the infusion of Vipers. II.

Respect is to be had to the inner parts. III.

Some are convenient for the fat and others for the lean. IV.

Mercurial Cosmeticks are hurtful. V.

I. Cosmeticks corrupt the Skin, 'tis better to use none: but those Cosmeticks that have sublimite in them are pestiferous and deadly; for they cause a stinking Breath, blackness and falling of the Teeth, Deafness, Stupidity, Palsie, Falling-sickness, and Apoplexy.

II. Some English Women of the better rank (as I have it from the faithful relation of some English Men) drink Wine wherein Vipers have been drowned, for an internal Cosmetick to procure pulchritude of Body and beautifulness of the countenance and all the Skin, without any detriment to their health.

III. If the Skin be stained through the fault of some internal part, as the Stomach, Liver, Spleen, those parts, are to be strengthened, the Concoction of the Stomach is to be helped, the fordid recrements of the Skin are to be deterged by Baths or Stupes.

IV. A Stupe is more convenient for Fat People whose Skin is foul; but a Bath is fitter for the lean or squalid, whether from the Sun, or from labour, or want of virtuales. There is the same reason of Topicks: for, convenient for these latter are oyls or ointments, or some water that has a deterging faculty, 1. the Decoction of spelted Barley, or the infusion of white Bread to wash the face withal; 2. ointments, the oyl of sweet Almonds, &c. For the former, viz. such whose faces look fat and moist, stupes and baths that deterge and dry much are more profitable. *Lignum f.* excels others in a deterging faculty, which will be a proper Remedy for the lean also, if Lilly roots, and white and fat Figs be added in its decoction, &c.

Rondelet.

V. Women that are more curious and pretend to the greatest Skill in the Cosmetick Art, are hardly content with any cutaneous Remedies but Mercurial; wherefore the following water is commended for all turpitudes of the face, and is sold at a great rate by Empiricks. Take of Mercury sublimated an ounce, being powdered put it in a Tin Vessel with three pints of Spring Water; Let them stand for twenty four hours, stirring them now and then with a wooden stutula till all the liquor look blackish, which yet being strained through brown paper will look clear: let the face be gently wet with this, by a rag or feather, once in a day or two. This Medicin helps notably any cutaneous turpitude whatsoever; namely inasmuch as it rids away the Humours that are settled within the pores and little holes be they never so small, it dissolves the inveterate and stubborn combinations of the Salts or Sulphurs, and all the Skin to which it is applied, has its passages restored by it to their due shape, and it self is rendered of a good colour. Wherefore it is not only profitable for clearing the face of stains or spots, but also for taking away the pustules and redness thereof, and other affections thereof of the nature of *Erysipelas*. Moreover it sometimes happens that most parts of the face, but especially the Nose and fore-Head, are thick beset with black specks, as if they had been burned therein with Gun-powder; which yet proceeds from hence, that the sweating holes are sometimes filled with a thick black Humour, and sometimes with little worms having black Heads (which little animals being squeez'd out of the pores and held up to the Sun, may be discerned to live and move themselves) and when the Skin is so affected, no washings or besmearings do any good except Mercurial: Yet there is often present a too malignant sting under this Honey; for the particles of the Quick-silver being applied to the Face together with the Salts whereby they are divided into those particles and sharpened, do rid and drive out of the pores the offending and defiling matter; but they follow it being driven inwards, and by and by do easily insinuate themselves into the Blood and nervous liquor, (whose crases they hurt) and by their means they often imprint afterwards an indeleble virulency upon the Brain, and sometimes upon the *precordia* and other parts. Hence it is a frequent observation that Women or Men that have long and much used the Mercurial Cosmetick, are subject to the Vertigo, Cramps or Convulsions, and Palsies, and that their Teeth are black and sometimes drop out. See § I.

By what means they may attract also the thicker Blood. IX.

Whether

Whether they are to be covered with a linnen Cloth, that they may attract the more strongly. X.

Cupping-glasses that draw by the sucking of the Mouth. XI. Whether dry Cupping-glasses be of any use to call out Malignity. XII.

The black Spots left under the Skin are no tokens of Malignity. XIII.

I. THE use of Cupping-glasses with scarification is Evacuatory, Revulsory, Derivatory and Attractory. It is reputed by some to be a general Evacuator, supplying the place of Venesection, and serving to lessen the Plethora of the whole: But I can hardly admit it this office, but with good reason do rather assent to *Celsus*, who says (l. 2.) Cupping-glasses are of use, when there is a fault, not in the whole Body, but in some particular part, which part it is convenient to exhaust for the confirmation of health. Thus he. And then, A Cupping-glass is to be applied to no other part but to that which is to be Remedied. *Gal. l. de hirud. &c.* Cupping-glasses are profitable after the Body is evacuated; we use them not in the Plethorick. The Egyptians use not Cupping-glasses with Scarification for taking away a Plethora in the beginnings of Diseases; for they cannot supply the place of Venesection, as appears, 1. Because the small extremities of the Veins and Arteries of the scarified part, do not satisfie an universal evacuation; and 2. They evacuate only the thinner Blood, the thicker being left behind.

Rolinc. meth.
gen. & part.
p. 393.

II. Vulgar Physicians now a days fearing the use of Cupping-glasses, and never using to apply them but in those that are ready to dye, and that can by no means be recalled, have made that Remedy infamous, whereas *Hippocrates* used them frequently, and perhaps as often as Venesection, as also in most pains, and in others in whom evacuation is only designed, as in those who have had falls. But what is it they are so much afraid of? Left, say they, Humours should be drawn from all about into that part upon which 'tis fixed. But *Hippocrates* speaking of one that had a pain in his Hip, says, that upon fastning a Cupping-glass upon the Hip, the pain fell down into his Leg and he grew better: So far is it from drawing always to the part it is fastened upon. What therefore, did the Cupping-glass thrust down the matter in this Man? No indeed, for how could it? but drawing it from the depth to the skin and digesting it, it gave Nature an opportunity to thrust it down the more easily. Is it a small matter for the Cupping-glass to draw from the part affected, that lies deep, to the Skin, unless it call the Humours thither from all about? Cannot the part that was preternaturally distended, be evacuated, but as much must be received from otherwhere? Cannot the parts subside? Certainly they are greatly deceived; for there is no present Remedy in all great pains, nor any that will sooner cause the matter to depart out of the part affected into some more ignoble.

Vallef. l. 4.
Epid.

Idem lib. 6.
lib. 2. Epid.

Hippoc. (as we may see *lib. de med.*) used many, and those differing in shape according to the diversity of pains: namely for pains that are situated deep, to make a great and strong attraction there is need of the frait-mouthed; but of wider, for pains that are spread as it were through the Skin. As for my own part, 'tis seldom but I use Cupping-glasses, either with Scarification or without, when any parts are pained, and the pain yields not to general evacuation as they call it.

III. We must fasten the Cupping-glass after such evacuation of the whole Body has preceded, as the Disease requires and the Patient can endure: for we must neither come in the first place to any Remedy that resolves powerfully; nor yet must we tarry so long till the whole Body be emptied and juiceless, as most Physicians do at this day,

who think no evacuation almost enough in order to the evacuation by the Cupping-glass; but we must consider how urgent the passion of the part is: And as we administer resolving Medicines to the Body that is begun to be evacuated, and stay not away till the evacuation be ended; so when the passion is urgent Cupping-glasses are often to be interposed amongst evacuations, that the Disease which cannot tarry for the whole evacuation, seeing 'tis needful to divide it, may be Remedied by using Venesection and Cupping-glasses by turns. For where the Body is not very full, or it is not the first invasion of the fluxion, we need not suspect that the traction will be so great, that the fluxion should be moved or encreased from the whole Body upon the part affected; for it will be enough if it be drawn from the internal seat of the pain to the Skin. For to fasten them upon the Hypochondres, is not to fasten them upon the Liver Spleen; nor is the fastning of them upon the Hypogastrium, the fastning of them upon the Bladder or Womb; nor if one fix them upon the Loins, does he fix them upon the Kidneys: for there are the Muscles and many other things between them: But if after Cupping-glasses have been applied, the pain and affluxion shall return again, what will hinder to derive again from thence by letting Blood? For in other cures, when we have some way satisfised the urgency, we return to the legitimate indications that arise from the causes.

IV. We must note, that if upon removing the Cupping-glass, even although the Skin be cut, yet the place still appear lifted up and tumid, we must apply it again: otherwise it might come to pass, which sometimes happens, that the Blood drawn and driven thither might cause an Inflammation, and sometimes beget a Gangrene.

Rub. in c. 11.
l. 2. Celsi.

V. The Story of a Courtier in *Hildanus* makes it plain, that the application of a Cupping glass upon the region of the Liver is dangerous: This Man bleeding much at the Nose, the Surgeon fastened Cupping-glasses upon the region of his Liver, whereupon it inflam'd, and was very hardly Remedied.

l. 2. de morb.
& l. 2. de affect.

VI. *Hippocrates* in the Quinsie fastens them upon the second vertebra of the Neck, then upon the Head being first shaved, and near the Ear on either side: In the Inflammation of the *Wolta* he applies them behind on the shaved Head with Scarification: In pains of the Ears, he fastens them behind the Ears, without incision, only that they may draw: All which must be done seasonably and with reason; for being applied to the Head unseasonably, they breed Lethargies, and stupors of the Body and mind, and if the Patient escape these, he falls into some continued Disease of the Head, as is delivered by *Aetius* (*Serm. 3. c. 20.*) and *Rubeus* in c. 11. l. 2. *Celsi*. An aged Woman labouring under an inveterate Head-ach and Dimness of sight, having while her Body was foul and unpurged, caused Cupping glasses to be applied, was shortly after taken with a Palsie of her Arms; however she recovered, but with much ado. A Potter being disempered in like manner, upon the application of them fell into a Palsie, but could never be cured.

Fab. Hilda-
nus Cent. 5.
obs. 71.

VII. The Wife of N. having her Terms stopt for three Months, was reckoned by all to be with Child; betwixt whiles crying out she complained of a great pain about her *Precordia* and a great difficulty of Breathing, many things being administered against Hysterical fits for Fourteen dayes. These proving little, I commanded the *Saphena* of both Ankles to be opened to revel the Blood from the oppressed *Precordia*; but the attraction of it towards the upper Parts was so great, that there flow'd not above an ounce by this passage that was opened in the Feet. Wherefore the Surgeon fixed six dry Cupping-glasses on each Thigh, and

and being so fasten'd he drew them from the uppermost part of the Thigh down to the Knee; in the evening he repeated the application and traction of them so often, till the inside of her Thighs appeared very red through the Blood that was drawn thither. After the use of these her pains presently seem'd more mild, the following night they decreased by degrees, and the next morning her Courses flowing they vanished wholly.

Soult. Ch.
Obf. 85.

VIII. When the Blood is not fibrous enough, 'tis very dangerous to draw it out by Cupping-glasses with scarification. *Prevotius* saw a Girl who upon the fastning of Cupping-glasses in that case, died of a pertinacious flux of Blood which could not be Remedied by Art.

Rhod. Cent.
3. Obf. 69.

IX. That the thick Blood may also flow out, according to *Avicen's* direction (*c. de ventosis*) we must bathe and stay an hour. Wherefore in Practice this is to be observed, that the part where the Cupping glass is to be applied, be fomented with a Sponge dipt in sweet warm water, that the Blood may be attenuated and fused.

Capivac.
pract. l. 6.
c. 16.

X. Cupping-glasses attract for the avoidance of a vacuum, on this manner: A piece of Tow (of Flax or Hemp) is kindled in the cavity of the Cupping-glass, then the Mouth of the glass is fasten'd upon the Body, and so the flame is smother'd and goes out: by and by the contained air, that was much rarefied by the flame, grows more dense, and takes up lesser room; therefore, lest there should be a vacuum, the Skin must needs be lifted up, to fill up that space that before was possess'd by the rarefied air: whence Cupping-glasses draw by so much the more, by how much the ambient air is the colder: And those mistake who cover them with Linen Clothes, &c. for the colder the ambient air is, the more is the included air condensed, and the more it is condensed, the less space it possesses, and so the Skin that is comprehended by the mouth of the glass is raised the higher. This reason is ingenious indeed, but experience refutes it: Those that have stood by when Surgeons have applied Cupping-glasses do testify, that if the ambient air be cold, they draw nothing forth, yea scarce raise the Skin at all: but on the contrary if the Patient sit by an hot fire, or be diligently covered with hot cloaths, they draw effectually & speedily.

Plemp. in
Indic.

XI. Of Cupping-glasses drawing by the sucking of the Mouth, see Book I. under the title of the *Atrophy*.

XII. Reason perswades and daily experience demonstrates that Cupping glasses, not only with scarification, but the dry also, supply the place of Venesection, for derivation and revulsion, when the weakness of the strength or faculties do not permit this latter. Dry Cupping-glasses, perform this without any loss of Spirits, for the Blood that is revelled or derived by them from any part, is only drawn for a little while into the dilated Vessels under the Cupping-glass, and as soon as the Glass is removed, it will return again by and by into the larger Veins: now in this case the Glass chiefly benefits, if it be removed, after the part, which is a receiving the fluxion, or has already receiv'd it, being freed from the influx of Humours, has restored it self to a better state: this, I say, is manifest. But it is not so certain that any thing can be called out by the application of dry Cupping-glasses: For whether you place the Patient in a warm Bed covering him well, or give him a strong Diaphoretick, you shall thereby procure sweat, but by such Remedies you shall not presently draw the Morbifick matter from the Patient along with the sweat, however not considerably, unless it be concocted and separated from the Blood, or be nearly disposed for separation. Although those things which being taken inwardly provoke sweat, have a faculty also to separate those things that are foreign, from the Blood; yet they produce

not such an effect being given at any time or after any manner, but only when given in convenient circumstances, without which they hurt more than benefit: That the like happens about Cupping-glasses I think can hardly be doubted; when *fluxus* afflic't, dry Cupping glasses being applied bring sudden benefit; for seeing *fluxus* are freed from the mixture of other Humours, they are not hindered from passing out through the open pores of the parts that lie under the Cupping-glasses: but such things as are mixt with the Blood, although together with it they fill the Blood-vessels expanded under the Cupping-glasses, yet they forsake not their companion in whose embraces they are straitly detained, but as soon as the Glasses are removed they return with the Blood into the larger vessels, unless through the vehemence of the attraction, the capillary vessels being opened, and the very substance of the Flesh gaping, they stick with the Blood in the *rimulae* of the Flesh or Skin, their return into the vessels being stop't after that those upon taking off the glasses have restored themselves to their former situation, and then the extravasated Humour concreting, it stains the Skin with black or livid spots (of which in the following section.) If therefore the malignant particles be exactly mixed with the Blood, and be not easily separable from it, dry Cupping-glasses are applied in vain: If they be separated, or be nearly disposed to separation, in my opinion 'tis better to administer diaphoreticks inwardly, and outwardly to use gentle frictions: By the former Remedy the poisonous infection is not cleared from any particular portion of the Blood, but from its whole mass; and by the latter not any particle of the Skin, but the whole habit of the Body is prepared to yield a ready exit to the poison: both of them benefit without any trouble to the Patient, or loss of his strength. But with a portion of the Blood to call out a small part of the poisonous infection to certain places, that it may return back again with the Blood into the Vessels, I see not what benefit can accrew from hence with respect to the Malignity, whose expulsion is here chiefly sought: But I am only certain that the Patient is vexed with an incommodious situation of his body and a distraction of his flesh and skin, especially when many Cupping-glasses are applied at once. But when the matter that partakes of Malignity is a separating from the Blood, or already separated, the ways by which it is cast forth are very rightly loosened, whether such relaxation be by Cupping-glasses, or by anointings, &c. The Serum, in which the poison is chiefly lodged, is always fitly cast forth by Vesicatories, not only because these open the pores of the Skin and of the glands that lie next under it; but because by their volatile Salt they attempt a separation of the Serum from the Blood. Some will object, That in malignant Fevers the Patient has presently manifest relief upon the application of dry Cupping-glasses? I answer, that that often happens, not in respect of the Malignity that is called out, but by reason of the revulsion of the Humours from the inner parts, the oppression whereof is suspended for a time, and the Patient gets leisure to recruit himself and to recollect his Spirits, that he may thence forward more strongly bear up against the fluxion: and that Remedy is chiefly convenient, when the weakness of the faculties hindreth revulsion or derivation by venesection: and on this account Cupping-glasses are called the Deputies of Venesection, especially when they are applied with scarification. Cupping-glasses may be also profitable on other accounts, though they draw none of the poisonous infection away.

XII. If dry Cupping-glasses be applied with a large flame, there must needs be a strong attraction, as they commonly speak, or rather a

ZZZZ

compul-

compulsion of the Humours because of the Cupping-glasses, and the flesh must be raised into a great Tumour under the Glasses, and thereupon the Skin must be vehemently distended, and the capillary Vessels spread through it distracted, and their Mouths loosened, their Sides broken, the Blood contained in them poured out, and when it is out of the Vessels, contract a blackness; seeing in a warm place, by the contact of the Air, by little and little it coagulates: These things happen not only to the Sick, but to the most Healthful. Therefore the blackish Spots that are bred of the Blood poured out in this manner under the Skin, do not denote the malignity, but the strong drawing of the Glasses, by using a great flame. Nevertheless those Spots are more easily raised in some, through the thinness of their Blood, the softness of their Vessels, the laxity of the Parts, &c. of which the Physician ought to judge from the different Circumstances.

The benefits of Sleep procured by Art. XLII.

I. **T**HERE are two chief Scopes upon which the Eyes of the Physician are fixed, The Faculty, and the Disease; the former requires to be preserved, the latter to be removed: the Faculty requires Meat, by which it self is preserved, but the Disease encreased; the Disease requires Remedies, whereby the Faculty is weakened. But because the Business cannot be done without both, a Diet is to be found out with Method, whereby the Patient may hold out till the crisis of the Disease. Now it is clear that the more Meat a man needs, the less can he bear the subtraction of it: And that one man stands more in need of Meat than another, happens either from the Disease, or from the Man, or from Externals: And in the Disease it self, either from its Constitution, or its Species: From the Constitution, because the longer it will be, the thicker Diet is necessary, namely that it may suffice for many days. Therefore he that would prescribe a right Diet to his Patients, must learn the Art of foreknowing the constitution of every Disease; and then must know also, that the longer the Disease is like to be, he must be the more indulgent from the beginning: Otherwise than improvident Physicians do, who having no foresight of future things, and observing that in acute Diseases the Faculty is sooner and greater affected, and urged with more frequent Symptoms, being afraid of the Faculty, begin presently to cram their Patients: and on the contrary, in the beginning of Chronical Distempers being affrighted with no Symptoms, and seeing but a small dissolution of the Faculties, they dare too much extenuate the Diet: And afterwards, when they see the Diseases continue longer than they had reckoned upon, fearing the length of Abstinence, they are forced to encrease the Diet; first indeed by the subtraction suffering the Faculties to be debilitated before the time, and then by the addition hindring the concoction of the Humours. Whereas they should do on the contrary; I mean, in the beginning of the Disease they should allow a fuller Diet, but when concoction is proceeding and the Disease passing to a crisis, they should withdraw it by degrees, with the same swiftness whereby the duration of the Disease it self is contracted: For those parts of the Disease wherein the concoctions do more employ Nature, do more forbid a full Diet: Therefore because of the alterations of the Humours the beginnings of Diseases (when Nature has not yet entered upon concoction) permit to give more meat than their increasings, and these than their heights. Nor must we act as we have said, only because of the concoction of the Humours, but in respect to the Faculty it self, because this is in so much the greater danger by subtracting Viſuals in the beginning than afterwards, by how much the more remains to be transacted. The Faculty therefore alone requires that Meat should be granted: but as for its quantity, that is shewn not only by the Faculty, but also by the time of the Disease; which indicates it, not indeed for it self, as begging, but for the Faculty, and permitting. From the Species of the Disease also there is some indication of the quantity of Meat; for seeing Meat is given for the Faculties sake, Diseases do by so much require the more Viſuals to be allowed, by how much the stronger in their own nature they require the Faculty to be, that they may be overcome: And the less the Parts affected can endure Meat, the less they permit it to be given. Therefore in those Diseases whose matter is within the Thorax, we must sometimes be more free in our allowance, than when the Natural instruments are filled with Excrements,

crements, because in those not only the Natural but the Animal Faculties also are defective: If therefore you let those who are so affected, languish too much through the withdrawing of Vi-
 ctuals, it will come to pass that though the matter be concocted, yet they will die, only by not being able to cough it up. For this cause 'tis clear that more Victuals should be allowed these; but for those that labour under Diseases of the Hypochondres and other Parts, less: And amongst these the least is to be given to those whose Distemper lies in their Stomach, because seeing the Part affected it self is to work the first and greatest change of the Meat, and to struggle with it when it is most crude, it is clear that it will be the most hurt by Meat. These are the Indications from the Disease; In the Man himself there are two things which indicate the quantity, his Nature and Custom: For those who have much natural heat, the same need much Food, and are soon brought low by a little; and therefore in Sickness the less is to be withdrawn from them: but from the contrary, more. Now those are soon brought low by a small allowance, in whom the Faculty of altering Meat is strong; because seeing that Faculty is natural, and cannot cease when there is matter present to act upon, when but a little Vi-
 ctuals is allowed, it parches the Excrements which must needs be in some quantity in the Publick Work-houses, by which by and by the substance of the Body is parched and melted, and the Meat it self being so little, instead of being concocted, is corrupted and vitiated. The disposition of the substance in Children requires also much Meat. Likewise great respect is to be had to the Custom, nor is that ever to be changed in sickness or in health, but by little and little, and when a man is unemployed. Which the generality of Physicians not considering, allow the same Diet to all their Patients. External causes are also to be considered, as of Time, to which the difference of Countreys is like: Thus the Winter and Spring make Mens bellies the hotter, &c.

II. The variation of the quantity of Meat is necessary, both in regard of the alteration of the Disease, and also of the different strength of the Faculty. For 'tis consonant to reason, that less should then be allowed when the Disease is greater: So in the beginnings of Diseases, when the Patients are however the more moderate, more Vi-
 ctuals may be allowed; but in the state, because of the vehemence of the Symptoms, 'tis clear that nothing should be given. Yet 'tis doubtful, whether we may always in the beginning of any Disease, be the more liberal in our allowance? I Answer, That it is not always true, but while the Body is affected with no other morbid apparatus: for if the first region be foul, or there be crudity, a thinner manner of Diet is better, till the crudity be overcome and spent by the sparseness of Diet; and Celsus's counsel holds, The beginnings of Diseases do in the first place require hunger and thirst. Let Hippocrates be consulted, Lib. 1. de viſ. Acut. 1. 32, 42. and 45. For both of them suppose that never any lived so moderately and sparingly, but that he takes somewhat more than is fitting, so that there remains something that is crude or excrementous: in respect whereof in the beginning of a Disease we must use sparseness of Diet. We must also take heed of the beginnings of all Inflammations, especially of the principal Parts, and of those which have a Fluxion joyned with them, wherein we must allow less in the beginning, and more when the Mouth begins to fill with Phlegm: for you erre very much if in the beginning you allow much Meat, as we find when the Humours are turgent, which suddenly pass into a Phrenſie, whence the Disease will perhaps last longer than the strength through the abstinence in the beginning can hold out.

III. Whether is it better to offend in too thin or too full a Diet? I distinguish (with Mercurialis) betwixt the Dose of Meat in respect of its virtue, and that in respect of its bulk; and answer, If one offend in a thin Diet in respect of its virtue, that is certainly a greater fault than if he offended in a fuller, because the Faculties being once cast down through want of sustenance, can hardly be recruited: But with respect to the bulk, 'tis far worse to erre in a full Diet than in a spare, because more Vi-
 ctuals being thrown in than is fitting makes the Disease, as Hippocrates writes; for there are more Excrements bred; whence there is not only afforded food for Putrefaction, but the Native heat is also dulled and the preternatural increased: Moreover Nature, which ought to be wholly employed in concocting the morbid Humours, is wholly called off from that work to the Meat to the very great prejudice of the Patients. ¶ Seeing we cannot always come to so clear an understanding of the Faculty, as from thence to prescribe a just form of Diet; and Patients use otherwise to offend in this matter, it is queried, Whether be the greater error, that, when too full a Diet is allowed; or that, when one too spare? But Hippocrates resolves this, saying, That the errors which are in any manner committed in a thin Diet, are worse than if they had been in a little too full: For many things may happen in the Patient beyond expectation, as sudden watchings and too great evacuations, Passions of the Mind, whereby the strength of the Patient may be cast down, so that he cannot hold out to the state of the Disease with this form of Diet: wherefore when the state of the Disease is approaching, 'tis then necessary to change the Diet, and to allow it a little fuller, which yet is very inconvenient, because through a fuller Diet, Nature is called off from her fight against the Morbid matter to the concoction of the Aliment. From all which 'tis clear, that 'tis safer to allow a too full than too spare a Diet; though, as to the quantity, we must rather look to subtract. Which being observed, the two places in Hippocrates which seem to contradict one the other, may be easily reconciled: the one is 2. de viſ. rat. Acut. where he says, We must much less intend the addition of Meats, but it is often altogether expedient to subtract: And the other 1 Aph. 5. Sick Persons offend in a thin Diet, whereby they come to be more hurt, inasmuch as any error here is wont to be worse than in a little too full a Diet. For in the former place Hippocrates speaks of the quantity, in which the same form of Diet being observed it is always better for us to be more sparing: but in the latter he speaks of the form of Diet, which if it be thinner than it should be, it brings greater inconveniences than if it were a little too full.

IV. Some have thought that it is the same thing in Acute Diseases to give a little of some more solid and stronger Meat, as to give such a quantity of some thinner Spoon meat, as yields so much nourishment as the little solid Meat that is taken in its room. But their opinion is refuted by Hippocrates, (Lib. de Veter. Medic. v. 91.) Whosoever, says he, take dry Meat, Hasty-pudding or Bread, although but very little, they are ten times more, and more manifestly hurt, than if they had used Spoon meat, for no other reason, but because of the strength of the Vi-
 ctuals in respect to the Disease, and in respect to him for whom it is convenient to sup, but not to eat. Here Hippocrates manifestly affirms, that when we eat something that is stronger than the condition of the Disease, and the nature of the Patient require, it always does harm; though in a small quantity it does less harm than in a greater. Which I would have common Practisers to note, who use so readily to allow both Bread and Flesh, and other solid food in acute Diseases.

V. Whether is Meat therefore to be detraſted, because there is a necessity to evacuate the Body? I answer, Though Meats are taken to recruit the Blood that is contained in the Veins, yet the Blood

that is stored up in the Veins takes not away the necessity of eating afresh; otherwise Athletick Persons, &c. should need no Meat, but might be long preserved without eating, which they cannot: Their Bodies namely, for retaining their strength, need some profitable juyce for the nourishment of the solid Parts, and fresh Meat and Drink for the recruit of the Spirits, otherwise they faint in their Mind and all their Faculties, though they are full of Humours. 'Tis not therefore because evacuation is needful, that there is no need of Meat; nay perhaps sometimes there will be need of grosser Meat, that the Faculty may sustain the Disease and the Evacuation. It would be strange if you should bid your Patient eat nothing because he must be let Blood; for by this means he will come to languish before so much is evacuated as is expedient. What is, that therefore which Hippocrates says, (*Lib. 1. de Vi&. Acut. l. 19.*) *Whoever use Barley-broths in these Diseases, let them not permit their Vessels to be emptied one day, as I may say, but let them use them without intermission, unless it be convenient to intermit them either for a Purge or for a Clyster.* Certainly it is not convenient, that that meat which is fitting for the Disease, should be let alone even for one day, unless some other thing intervene, which may cause an intermission; as if at the hour the Patient was to Dine, there unexpectedly happen a rigor or chillness through the beginning of another invasion of the Disease, it is manifest that Dinner is to be omitted for that time: So if, when as the Patient used daily to eat at Noon, some certain day he takes a Purge, he must be dieted on that day, not as he was wont, but as the Purgation indicates. The same thing may happen when a Clyster is to be used, namely when the former meat is not descended, the disposition requireth that the Clyster be injected and meat intermitted.

Valles comm.
in præd. lo-
cum, pag. 19.

VI. When the Crisis is at hand, Hippocrates withdraws Spoon-meat, lest Nature be diverted from her work and the Crisis hindered. But because by a Crisis Hippocrates commonly understands any solution of the Disease, and not only that which is made to health suddenly and with some sensible evacuation, Spoon-meat is not to be withdrawn before every Crisis, but only in that which happens by the means of some sensible evacuation, which he intimates a little after, *if the Patient be disturbed*: For when there happens a disturbance upon the Diseases proceeding to its highest vigour, then there is to be expected a Crisis with a sensible evacuation, according to *Aphor. 13. 2.* From which opinion of Hippocrates there may be easily gathered a reason why in Diseases of the Breast 'tis convenient to encrease Spoon-meat about the Crisis, namely because in those Diseases there is no Crisis that has a disturbance preceding it, and indicating a sudden Crisis with sensible evacuation, seeing the matter is brought out by little and little by spitting, which Spoon-meat will not hinder, yea it will further it, both by moistening the Parts of the Breast, and also by strengthening the Faculty.

Martian.
comm. in v.
138. V. Acut.

VII. There are different opinions whether the reason or manner of Diet should proceed by *incrassating*, or *extenuating*. I shall make appear which is the truest by two Conclusions: The first is, When the Disease is known, is simple, and the Faculty strong, the indication being taken from the Disease, if that keep the matter for one critical evacuation, the reason or manner of Diet ought to proceed by extenuating: The reason is, because all the times fall in together; for the Disease, when it is in the beginning, state, augment, as to the alteration of the matter, is in the beginning as to its Essence and as to its Symptoms. Seeing therefore the Disease and Symptoms are less in the beginning, and greater in the augment, and yet more vehement in the state, the indication being taken from the Disease it self, we must feed more fully in

the beginning, more sparingly in the augment, and the most thinly of all in the state. The second Conclusion is, When the Disease keeps not the matter from the beginning, but that begins to be Purged out by degrees, the manner of Diet ought not to proceed by extenuating, but by incrassating: The reason is, when the Disease is in the augment, or in the state as to the alteration of the matter, the Patient hath now escaped the danger, and the Disease hath had a *Crisis*, because it is in its declination as to its essence and as to its Symptoms: Therefore the Patient is to be dieted more fully then than before. But, How can the Disease be in its augment, or state as to the alteration of the matter, and not as to its Essence and Symptoms, seeing the coction that is made in the Veins partakes of Putrefaction, and is like to that which happens in Inflammations, according to *Galen, 1. de Diff. febr. 5.* therefore if the Putrefaction be increased, the Disease with the Symptoms will be increased also? I answer, In the internal cause, which begins, cherishes and increases the Disease, two things are to be considered, the *quality* and *quantity*; The first is acrimony, heat, or an evil quality arising from Putrefaction and Corruption; the second is either the same and equal, or is greater and lesser. Quality alone cannot bring on a determinate Distemper without a certain quantity, and the greater this is, the greater is its effect, because there is no Agent so prevalent that can impress its effect without a certain quantity; hence a spark of fire warms not, much less burns. From this cause although in the augment and state the quality of the cause be strengthened as to the alteration of the matter, yet seeing the quantity is diminished, it cannot make the Disease greater than it was before through the defect of the quantity. You will object 1. The more the Disease recurs, the fuller Diet we must use, because the Faculty being made weaker by the Disease and the Remedies, seems the more to be recruited. I answer, 'Tis true that the Faculty is weakened in the Progress of the Disease; yet if the Diet be prescribed as it ought, then in a Disease which terminates in health the Faculty is always superiour to the Disease; for, that the Disease may not encrease with greatness of Symptoms, we permit the Faculties to be a little dissolved, because we must not provide only for the Faculty, but also for the Disease. You will object 2. In the beginning of the Disease there is greater plenty of crude and rebellious Humour, therefore a thinner Diet is then convenient, that Nature may not be diverted from the concoction of the morbidick matter that is crude and untamed. I answer, in the augment and state the Faculty is more hindered than in the beginning, for the heat and acrimony of the Humour, now boiling and rarefied, irritates more, and therefore Nature being provoked uses greater endeavour than in the beginning, and therefore is not to be diverted from that work. You will object 3. from *Aph. 1. 1. 1.* In the beginning of a Fit the Patient ought to abstain from Meat, and therefore he is to be more sparingly dieted in the beginning of the Disease also, if there be the same reason of general and particular times. I answer, That there is great disparity between them, for in the general or universal beginning the Disease and Symptoms are always less, but in the particular greater, for it is the worst time of all the Period, and therefore the more unfit for giving of Meat. Obj. 4. In an unknown Disease, according to *Avicenna*, we must shorten or thin the Diet; but the Disease is less known in the beginning. Answ. The Conclusion is to be understood of a known Disease, for when it is not known, a due regiment cannot be prescribed: but if it be known in the beginning we must feed more freely, and afterwards more sparingly. Obj. 5. Hippocrates 1. de Vi&. Acut. l. 21. where he treats of the Pleurisie and acute Diseases, says, Neither

Hist. 1. 144

Neither much nor thick Spoon-meat is to be offered in the beginning: And Text. 23. If the Mouth, says he, wax moist, and there appear an evident and perfect concoction, the quantity of the Spoon-meat is to be encreased. *Ans.* Hippocrates discourseth there of a moist Pleurisie, in which the matter is purged out by degrees, in which case the Diet should be fuller and fuller. If you say that every Pleurisie does not terminate in a gradual evacuation, seeing it often ends Critically, as in *Anaxion, tertio Epid. 3. 79.* who was twice cured by a Critical Sweat. *Ans.* 1. *Anaxion* labour'd under a double Disease, one from the Humour contained in the Veins, (and from thence the Fever sprang) of which he was cured by the Sweat; the other from the Humour settled in the *Pleura*, whose Crisis was by spitting. 2. In the Pleurisie and all internal Inflammations, a most thin Diet is convenient in the beginning, that the Fluxion may be stopped which will give an encrease to the Inflammation; for the Parts through Abstinence becoming needy, they retain their Humours, and suffer them not to flow together to the Part affected: But when there begins to be an Expurgation, a fuller Diet must be prescribed, that the Patient may cough up easily, and his animal Faculty, which it needs, may be strengthened.

Hist. 50.

VIII. Whether is it worse to offend in Meat or in Drink? *Celsus* answers, l. 1. c. 2. *Often if there be any intemperance in the case, 'tis worse in Drinking than in Eating.* Reason confirms it, 1. Because the immoderateness of Drink is commonly greater, seeing drinking does much burthen the Belly. 2. Because Drinking is more opposite to the innate heat, and by its plenty the heat is sooner extinguish'd than by Meat, like fire. 3. Much Drink is not concoctible, and it is hardly superable by Nature, yea it is an hindrance why the Aliments are not concocted, because it is mixed with them, and makes them slippery before concoction: Hence it comes to pass that the more men abstain from Drink, the more healthful they live, and less liable to Diseases: but through immoderate moisture a man is greatly subject to Diseases from Putrefaction.

Zacut. Pr.
Hist. p. 544.

IX. *Galen* (*Aphor. 17. 1.*) intending to cure corruption of Humours, the Faculties being weak, has these words: *If the Faculties of the Sick Person be weak, and that disposition which is in the Body, be from corruption, or defect of Humours, we will give to such a little sustenance: and often: little indeed, because the weakness of the Faculties cannot sustain the whole multitude of the Aliment together; but often, because the Disposition needs many things, inasmuch as the defect requires addition; and the corruption contemperance.* By which words he affirms that corruption of Humours requires many Meats, and that it may be corrected and cured by them. This Doctrine seems to be contrary to Hippocrates, (*Aph. 10. 2.*) *The more you nourish foul Bodies, the more you hurt them:* And 7 *Aph. 67.* *If any give Meat to one in a Fever, 'tis Strength indeed to the healthful, but a Disease to the sick.* Solve the contradiction by saying, When the Faculty languishes, Dieting may be proposed two ways, either with evacuation, or without it: this latter way it is not granted according to *Aph. 10. Sect. 2.* But with evacuation frequent eating is prescribed as profitable and necessary, for the corruption needs many things, that is, addition of Meats, because instead of the vicious that ought to be evacuated, that which is profitable ought often to be put into its place by allowing Aliment; which curing of the vicious Humour Physicians call *Epicrasis*. Or say, That the Cure by *Epicrasis* may also be effected by Aliments, and refrigerating and moistening Medicines, that can dull the edge of the acrimonious and biting Humours: which seeing they are temperate (called by the Greeks *Eicrasica*) do blunt the acrimony of the Humours, drive away Putrefaction, are rightly concocted, recruit the Faculties and are in no wise

corrupted, especially if their quantity be lessened; otherwise they increase it; for *Galen* (2. *Simpl. c. 12, 13 and 14.*) teacheth, that when acrimonious Humours abound, temperate Aliments do not mitigate their biting, but they are rather corrupted: yet on the contrary, if their abundance be evacuated, they contemperate them, because they are not then corrupted by them, seeing they are the more prevailing.

Zacut. Med.
Princ. lib. 2.
Hist. 91.

X. Hippocrates (2. *de Vill. Acut. t. 24 & 25.*) saith, that those who are wont to make two Meals aday, if they dine not, are made weak and infirm, and are affected with many Symptoms, even when in a state of Health: Hence he concludes, *a majori*, If such things come to pass in the healthful through the unaccustomed omission of a Meal in the middle of the day, what shall we think must happen to sick Persons? Physicians therefore erre, who after they have starv'd the Patient for many dayes, do suddenly again recruit him, against the Aphorism, *To empty or to fill much and suddenly; &c.* is dangerous.

Vallecomm.
in cit. loc.
p. 69.

XI. The Prudence of the Ancients is to be consider'd about the Diet of debilitated Persons, who gave a little thin food to the newly Purged, or to such as had otherwise been exhausted of their own accord: So Hippocrates 5. *Epid.* durst give to one taken with a cholera, nothing but thin Gruel made of Flowr and Water. Otherwise than the vulgar Physicians do, who allow a great deal of gross food with Wine; as if that which hath been spent in many dayes, they would restore in one.

Vallecomm.
in cit. loc.
p. 469.

XII. It happened that a Countrey-fellow that was taken with a very acute Fever, being brought to the Hospital could hardly be cured by D. *Gisbertus* with any Remedies: At length when he was even ready to dye, he askt him whether he desir'd any thing, what kind of Diet he had used formerly? He answer'd that he wholly loath'd that Meat and Drink, Syrups, &c. and that his Bed was too soft: that he had used to feed upon Onions, Cheese, Flesh of hard concoction; and to sleep in the open Air with his Cloaths on. Then D. *Gisbertus* let him lye one Night in Straw, and permitted him to have an Onion and Salt and cold Water; believing that this would presently dispatch him out of the way, whereas he found him next day standing by the fire. ¶ In the year 1668. a Gentleman at Geneva was ill of an acute Fever, who had lately left the Wars; his name was *Debulet*: He had no Sleep for eight Nights, nor could I procure it by any Remedies. His Wife tells me that her Husband desired to lie one Night in Straw, thinking that perhaps he might sleep there: I would not deny his request; knowing how great the strength of Custom is: So we put Straw under him, upon which he was hardly well laid, but he fell fast asleep, and shortly after recover'd his Health.

Sect. 16.

XIII. Although a more plentiful Diet is to be allowed in the beginning of a Disease, according to the precept of Hippocrates 1. *Aph. 8.* *When the Disease shall be in its vigour, the thinnest Diet is to be used;* both because the Disease is less and does more permit food, and also because the faculties are stronger; and less intent upon the concoction of the Morbifick cause: yet sometimes a thin Diet is profitable in the beginning, and a more plentiful in the state. 1. *Galen* (12. *Metb. 6.*) when the Humours that raised the Fever are coming to concoction, grants flesh, which he permitted not before. 2. In 1. *Acut. ult.* in the beginning he orders Barley-cream, and then Barley and all. 3. *Celsus* 2. 16. says, that the beginnings of Diseases require hunger and thirst. 4. Hippocrates, *Galen* and *Avicen* affirm, that if the Patient be to be bled, or purged, or to have some pain allayed, no meat is to be given till these things be done, and they are to be done in the beginning

of

of almost every acute Disease. (1. *Apb.* 24. and 2. *Apb.* 24.) 5. When the Disease does so afflict with plenitude, that there is fear it should choak the Patient presently, then he is to be Dieted sparingly in the beginning. 6. In Wounds and Ulcers, according to *Hippocrates* (*lib. de ulceribus*) and in Inflammations; for in the beginning of these there is need of greater attenuation than in the progress of the Disease; because in these we endeavour to restrain the defluxion, for which purpose great abstinence is very profitable, otherwise there is danger of a Phrensie, Convulsion, &c. 7. If in the augment of the Disease, or in the very state there happen any Symptom that destroys the faculties, we must presently endeavour to strengthen them by a fuller Diet, and yet as soon as the Symptom is allayed, the reason of the state of the Disease admonishes to return to the former thinner Diet. 8. In Fevers that are fierce and vigorous in the beginning, and about and in the crisis are lessened, (of which *Hippocr.* 1. *Epid.* 3. 1.) then in the beginning we must Diet more sparingly to lessen the cause. 9. In Malignant Pestilential Fevers, wherein the faculties being wasted by the poisonous Air are near extinction, a fuller Diet is to be allowed in the state: For Patients that have eaten and drunk stoutly in the Plague, have escaped from it, says *Galen* 3. *Epid.* 3. 77. On this account in colliquating Fevers, in which the faculties are greatly enfeebled, he allows a fuller Diet in the state, 12. *Metb.* 3. lest they fail; for the hurt that springs from a full Diet in the state is less to be regarded, than death which is certainly at hand from the total loss of strength and the resolution of the whole habit of the Body. 10. In the state we must sometimes Diet more fully, when there is fear of arefaction or falling into an Hætick Fever: for when the primigenial moisture of the Parts is by little and little and insensibly digested by the febrile and roasting heat, then we must use in the state a moistening Diet, and that full, which may correct or prevent the future driness. 11. The Physicians of our dayes order a thinner Diet in the beginning of Diseases, because it greatly conduces to the concoction of the remainders of the half concocted aliment which sticks in the Stomach and first ways; for then for this reason 'tis good for a day or two to use a thinner Diet, and then if debility of the faculties follow, to use a thicker; yet with this consideration, that as soon as the faculties are recruited by this means, the Diet be lessened again even till the state; Wherein although there be need of an attenuating Diet, yet if through preceding evacuations and the vehemence of Symptoms, the faculties be more languishing, then being driven by necessity we allow a fuller Diet in the state.

Zacut. Pr.
Hist. p. 537.

XIV. Although when Chylification is hurt, the other functions that follow that first, will become vitious also; yet we must not deny the whilst that it sometimes happens, that the sick not only receive no prejudice thereby, but rather that their lost Health is restored by the vicious Chylification itself. But as often as that happens, it happens either by chance, or by art, because from aliments that are not so very laudable, and which one would hardly allow to the well, there is prepared such a chyle in the Stomach as serves instead of a Medicine to correct and amend the vicious Humours in the Body of the Sick. Hence it is that they are sometimes cured by eating some food that is hurtful in it self, and yet Medicinal to them, and is potently, or impotently craved by I know not what instinct now and then.

Fr. Sylv. Append. Tract.
3. § 42. &c.

XV. Seeing the Physician cannot always obtain of his Patient to abstain wholly from hurtful food, he must diligently endeavour to be well acquainted with Medicines that may remedy the hurts arising therefrom. Thus, for example, if any Pati-

ent's belly used to be extended upon the taking of certain aliments, as suppose Milk and the like, and the Physician know that such tension depends on flatus raised from the Milk, things that disperse wind shall withal be prescribed the Patient; and of the number of those let the Physician select such as he has learned by experience serve for discharging flatus raised from Milk.

From this Foundation sprang the Art of seasoning meat, but in tract of time, as most other things are wont, it degenerated into abuse. For the various seasoning of Meats seems to be invented not so much for the sake of correcting aliments that are vicious in some regards, as for the sake of divers relishes grateful to the taste and apt to excite Men to gluttony. But when aliments are seasoned according to the prescript of the Medical art, not a few harms that are otherwise to be expected from them, are shunn'd and prevented.

Idem tract.
5. § 222.

XVI. As many as after the manner of the Ancients commit the greatest part of the cure of their Patients to a Chimerical or I know not what Nature, and then, excepting the Diet, which they order after a fort, are only Spectators of the fight, which they Romance to be raised between Nature and the Disease, and so are judges of the Victory, which one while is on the Diseases side, and another on Natures, such Persons indeed offend in defect: But as many as, besides Diet which consists in the six non-natural things duly administered, do moreover think that Medicines are to be prescribed by understanding Physicians, at least in most Diseases, which may correct or cast out all that which is apprehended to be besides Nature in the Sick, these would have Physicians to be not only Spectators, but Actors also. And surely that Physician seems not so well to satisfy his own office and the expectation of the Sick, who performs only one part of his office, which consists in a due ordering of Diet, while he neglects the two others that consist in the right direction of Surgery and Pharmacy. For I think a case cannot easily happen wherein there is no place for prescribing some Medicines. Indeed I deny not that the Sick may be cured, nay that they are often truly cured, though no Medicines were prescribed them by Physicians; but none shall easily persuade me, that the same are cured so soon, so safely, so easily and pleasantly, as if convenient Remedies had been administered to them. For one may have often observed such Sick Persons as have been helped by Diet only, that they have been longer ill, have often suffered dangerous relapses, or have not escaped from their Maladies but with difficulty and irksomeness; when on the contrary those to whom fit Remedies were administered, have been cured both shortly, and safely, and pleasantly.

Idem tract.
8. § 199. &c.

XVII. On the contrary vicious Humours are often amended, not only by the vertue of Medicines, seeing often none are taken, but by the help of Diet alone, namely such as is apt to procure that emendation; not indeed such as is temperate, and is owing to healthful Persons, but such as departs from temperateness and mediocrity; yet so that it be somewhat contrary to the fault of any offending Humour, and therefore convenient for correcting and tempering of it; whether such Diet be prescribed by the Physician, or, which happens oftener, chosen and used by chance by the Patient himself: for in furnishing of it chance oftener has place than reason.

And indeed I deservedly wonder that from Diet so often changed by chance, there should be so great changes not only for the worse, but also for the better; and yet that the true reasons and causes of such mutations are not observed by Physicians: seeing Patients do far more easily suffer themselves to be governed by Diet than by Medicines. Which Diet if it be prescribed them, and be

Idem tract.
10. § 245.

be not morose and disdainful, (yea often fanciful enough) but easie, grateful and taken from experience, by the help thereof very many benefits redound to sick and recovering Persons.

XVIII. Know that in the time of pain all meat whatsoever is not without fault, especially that which easily waxeth sour, or turns into fume; for on both accounts it encreaseth the pain. For Ptisan or Barly-broth, which is received by Hippocrates as the most convenient food for those that are sick of an acute Fever, is rejected by him in the vehemency of pain, 1. de viſit. Acut. Except, sayes he, you ease the pain either by procuring stools, or bleeding, accordingly as either is requisite, and shall give Ptisan to those who are so Distemper'd, you shall drive him head long to Death. Concerning other meats in the time of pain he sayes, These things seize on him, not only if he use ptisan unseasonably, but much more if he eat or drink any thing that is more inconvenient than ptisan. You will object, that Hippocrates has there forbidden ptisan, as also other Meats, not account of pain, but of the Inflammation of the membrane that cloaths the Ribs, which he was speaking of, and which he called pain. It is so indeed, and yet that stands good which we have said, That in the time of vehement pain all meat whatsoever, even the lightest, is not without fault, yea is very prejudicial. For pain is one of those things which do most of all cast down the vigour of the Body, so that neither does the Stomach concoct aright, nor the Liver or Veins turn it aright into Blood: neither moreover is the distribution, apposition, expulsion of excrements, or any of the natural actions performed duly because of the pain hurting the actions, and especially for that Nature being intent upon that which grieves her, sends the Blood and Spirits, which are the common instrument for all actions, to the place of the pain: whence it comes to pass that the parts appointed for concoction suffer a want of them; which is a cause that the Meat is ill concocted in the Stomach, Liver and Veins, and easily acquires thence a foreign or preternatural heat, & at length becomes a cause of the encrease of the pain. When therefore the parts appointed for concoction suffer a want of the influent heat, and the object on which it is to work, remains on that account liable to a foreign heat (Nature being intent upon another work) Physicians do advisedly to let Blood: in a great pain, that as much as Nature fails of her wonted care, so much the Blood may be lessened; Nor is Blood to be let only, that we may preserve the Humour that is in the Liver and Veins safe from a preternatural heat, but we advise provokers to vomit for the meat that is in the Stomach: It would be mad advice therefore to administer meat at that time, wherein the emptying of it out of the Stomach is a Remedy for the pain. But seeing there are many differences of pain, so that some invade and remit by turns, some torment continually, and of these some have got such a vehemence as to bring the Patient into watchings, and others into inquietudes, the same course of diet is not to be taken in them all. Whosoever are disquieted with continual pains and watchings, must abstain from all Meat and Drink; for the Disease to which a continual inquietation is joined, is terminated within four dayes, for its vehemence, and therefore a total abstinence is convenient. Those pains indeed are the most vehement, that bring the Patients into inquietude. Hence Galen l. 1. Those that are ill of pains, are often without a pulse, and fall into faintings, and can be moved no manner of way: The like things to these happen from the acuteness of a Disease: But there are some whose faculty is not affected hereby, but through an evacuation of the vessels made some manner of way. Whether therefore it be through an excretion manifest to sense, or by perspiration, or through fasting, these indeed need nourishment and refreshment quickly: But

on the contrary if it be through pain, or acuteness of the Disease, they stand more need of some evacuation than addition; yea he that gives food to these, does them the greatest mischief. From Galen's words a strong argument is taken, that no food is to be given to one labouring under a vehement pain, with strength of the faculties, seeing he writes that it does much mischief to those who are made very weak through pain, so that they are without pulse, and are taken with swooning. In those pains that are next to the most vehement the Patients can keep one posture of lying, but can take no sleep; wherefore such a Diet is to be granted to these as we said was convenient for those Diseases that terminate on the seventh day; for continual watchings are one of the three Symptomes that terminate a Disease on the 7th day. For those therefore who through pain endure continual watchings, such sustenance as is to be drunk is convenient: So Hippocrates: But we must use Drink, if there be any pain, vinegar and Honey (or oxymel) hot in the Winter and cold in the Summer; but if there be much thirst, Water and Honey, and Water alone. In which place Hippocrates hath defined the form of Diet from the reason of the two Symptomes, from pain and much thirst; whence gather, that when there is any pain, we must use something to drink for our food, and that there is no place for such things as we use to sup.

XIX. Hippocrates sayes, Ptisan (or Barley-broth) seems to me to be rightly preferred before all food made of Bread-corn in these acute Diseases; and indeed I commend those who prefer it: for its lentor (or clammy glibness) is smooth and continued, and pleasant, slippery and indifferently moist, &c. Note that Hippocrates does not say that Ptisan is better than all other food, but that it is deservedly preferred before all other food made of Bread-corn: Therefore every Physician will prescribe to his Patients that are ill of Fevers rather Ptisan of Barley than of Wheat or any pulse: yet it is not therefore worse to give them Hen or Chicken broth, boiling such things therein as are proper for the Fever, viz. cooling Diureticks, &c. And not this only, but there are other things that are every whit as good, as potcht Eggs, and small Fish that live in clear stony Rivers: for the Diet of Feverish Persons is not defined by any certain matter, but that it be thin and moist, easie of concoction and of good juice. The most ancient, that were not far removed from the first Men, lived more upon pulse, fruits and herbs, and were not so accustomed to Flesh; and therefore Physicians used rather Pisans in acute Diseases than Flesh: But now Men are such eaters of Flesh, that from the indication of custom, Physicians have deservedly turned to thin flesh and omitted Pisans. ¶ The Marrow or crumb of a white loaf boil'd in broth, is a frequent dish in our dayes: whether it ought to be had in the number of meats, or Spoon-meat, is not clear: for Hippocrates (lib. de Affet.) hath placed it among meats, when he commands it should not be given to Persons in Fevers: We give it to such instead of Spoon-meat; and if such crumb by long boiling in broth be reduced to smoothness, so as it may be sup't, it is placed in the rank of Spoon-meats, and may be given to Persons in Fevers: And this is it which we commonly use, and vulgarly call Pap. If the said crumb be only wet in Broth, it ought to be ranked amongst meats, in which form Hippocrates will not give it to Feverish Persons. ¶ The many benefits that are ascribed to Ptisan, agree to this; yet that heat which it acquires from the ferment seemeth to be somewhat contrary, so that upon this account it is hotter and drier: But according to some Mens opinion it is not unprofitable to wath the Bread once or twice in pure water, and then to boil it in good broth, especially that of a Chicken, which attemperates all the Humours and brings them to an equality: long boiling is to be added, which procures equality of substance

substance as to Ptisan, so to Bread; so that it becomes most easie of concoction, and most agreeable to Nature.

Foris conf.
82. cent. 9.

XX. *Ptisan* is not generally good for any unless those that are in Fevers, or that have an estuating Stomach or Hypochondres: it produceth a thick juice, especially joyned with Pine-apples; and being endued with a deterging vertue, it also hurries the meat off the Stomach sooner than is fitting.

XXI. Many things are deliver'd concerning the choice of water, and how to know which is better and which worse; Some approving most of all of *Rain-water*, as being thinnest and boiled as it were by heat; others greatly dispraising it, as partaking of all Malignant qualities, inasmuch as it is drawn out of all things, even the most hurtful and fordid. Some preferring before all other *Well* or *Conduit-water*, as being the best cleansed by their percolation through the Earth; others thinking these to be the most thick, crude and flatuous of all: and some lastly esteeming *Fountain* or *River-water* the best. I think it is consonant to the opinion of *Hippocrates* and *Galen*, and so to the truth, that *Summer Rain-water*, that descends with Thunder and Storms, is the best of all; inasmuch as this is not truly made of Vapours that are thick and that ascend with abundance of moisture, but of such as are thin and are hardly extracted by the force of the heat: but that other *Rain-water* which descends from thick and very opaque Clouds, and is foggy, is the worst of all, fordid, partaking of evil qualities, and easily putrefying. Moreover *Well* or *Conduit-water*, that is sweet, and is known to be derived from the next River or Spring, is better than River or Spring waters themselves, unless the Ground that lies betwixt the Wells, and the Rivers or Springs partake of some foreign quality: But if the *Well-water*, as it commonly does, proceed from that abyss of waters that is every where under the Earth, it is certainly the thickest and most crude. Seeing therefore the best *Rain-water* cannot be procured without too great curiosity, and *Rain-water* is seldom to be had from a River, and has that danger with it which we spoke of the ground or soil, it is better to use Spring or River water, the best that is in or near the Town we live in; especially seeing that vertue which is in the *Summer Rain-water* you may impart to *Spring-water* by boiling it, and that vertue that is in *Well* or *Conduit-water* you may impart to *River-water* by barrelling of it up: For both by barrelling up, the water is purged, and by boiling, it is moreover attenuated; but *Spring-water* cannot be kept so well as *River-water*: Yea and besides the boiling, that *Water* which flows out of Springs that are high and exposed to the Sun, that run down a steep place towards the Rising, or Noon-Sun, is wont to be more concocted and better than that which runs out of dark and foggy places towards contrary places.

Valle Comm.
in l. de vit.
Acut. p. 127.

But because one *Water* differs so much from another, *Spring* from *Spring*, *River* from *River*, and *Well* from *Well*, that many *Spring* and *River Waters* are worse than most *Well-waters*, 'twill indeed be better to try by proper Notes the very *Water* by it self, omitting its manner of breaking out of the Ground, and in every place to use that which Nature has provided the best there, whether it run along the Ground, or spring up in a *Fountain*, or be drawn out of a *Well*: That is best which is most simple and thin: you may know its simplicity, from the greatness of its want of taste, colour and smell; and its thinness, from the quickness of its growing hot or cold, as it is said in the *Aphorism*: for you will find this a better and more exact sign, than that which is taken from its weight.

XXII. *Hippocrates* adds, In acute Diseases I have no other operation to attribute to the drinking of *Water*, that is, *Water* performs nothing else for the Body than to serve for drink; and to serve for drink, is nothing else than to be a vehicle for the Aliment. You will object that it is said 6 *Epid. f. 4. Water is devouring*, that is, it stirs up an appetite to meat; and that *Galen* (*m. m.*) reports very many things of plentiful drinking of cold *Water*, namely that it extinguisheth burning Fevers, if it be taken seasonably, and by a fit Person, namely by such an one in whom there is neither crudity, nor any inward inflammation, nor weakness of any principal Part, nor too much leanness of Body: for these things are not to be remedied by drink only, but by the best Medicines. But inasmuch as it is said to be *devouring*, that belongs not to acute Diseases, but to the Diet of healthful Persons. As to what we said of its extinguishing of burning Fevers, *Hippocrates* does not deny the first vertues of *Waters*, that is, those which are in them in respect of their first qualities (for he will not gainsay that they cool and moisten) but only the second and third: for *Water* neither incides, nor cleanseth, nor doth any other thing in a Man which belongs to the second faculties; nor does it either astringe, or loosen, or draw, or repel, but as it refrigerates, and therefore it neither asswageth a Cough, nor brings up *Phlegm*, nor loosens the Belly, nor provokes *Urine*, nor does any other thing that belongs to the third faculties; nor does it draw forth sweat, or breed Milk, nor lastly is any other faculty attributed to it than to convey the aliment, and to cool and moisten, and by cooling and moistening it extinguisheth a Fever. Idem.

XXIII. But a little water, adds *Hippocrates*, if it be supt betwixt *Oxymel* (or Vinegar and Honey) and *Melioratum* (or Mead) brings up *Phlegm*, because of the change of the quality of the Drinks: That is, if he that useth *Oxymel* or Mead made with Wine, do betwixt these sup a little water sometimes, even the water will further the Coughing up; not indeed as if that were proper to the *Water*, but because seeing it is void of all faculties, it easily receives the vertues of all the things wherewith it is mingled, or which are boiled or steeped in it: When therefore it is drunk betwixt Mead and *Oxymel*, it makes an inundation, and moves the other drink and is mixed with it, and encreaseth the fulsity and therefore the Coughing up. Idem.

XXIV. *Hippocrates* in the foresaid place, sayes, that water is *Cholerick* to a *Cholerick* Nature; and therefore such as have a *Cholerick* Nature, it cannot quench their thirst, but rather irritates it. But how is *Water* *Cholerick* to any, that is so greatly contrary to *Choler*, seeing it is cold and moist? Not surely as if it self were turned into *Choler* (for so it cannot be) but because making an inundation of *Choler* it does after a fort encrease it, and causes it to redound this way and that way, like indeed as he that pours *Water* into Wine, makes there be more Wine, namely such as is dilute: Indeed nothing is more known by experience, than that by drinking water the bitterness is increased in their Mouths that abound with too much *Choler*, namely the *Choler* being diluted floats even to the Mouth; and therefore in such, thirst will be irritated by *Water*. Idem.

XXV. In the same place *Hippocrates* speaks thus of water, Neither does it quench thirst, but encreases it; for it is of a bilious Nature (as was said before) and is naught and very bad for the Hypochondres, and does greatly cast down the faculties when it enters into the vacuum, and encreaseth the Spleen and Liver when they are scorched, and it fluctuates and swims atop, for it is of a slow passage, because it is coldish and crude. That is, it is very bad for the Hypochondres, because it is very cholerick, and encreaseth the cacochymie: And if it slide into the

vacuum

vacuum that is there betwixt the Bowels and *Peritonæum*, it casts down the faculties, as in hydropical persons, and swell the Liver and Spleen when they are scorched, because it passes not through, but fluctuates there and swims atop: and those viscera swell from the water that abides in or upon them, especially when they are hot with much choler which the water increases; and it passes not through because it is cold and crude, for those things that are such, are of slow motion. For this cause it neither provokes to stool nor Urine, because it stays long; and it does some hurt on this account, because Nature is without excrements; it is *ἄσπερον*, which term some think is given it because it causes no defection, but I think it rather signifies either the Intestin that wanteth excrement, or the food of which no dung is made: here it is spoken of water, and therefore it signifies that no Dung is bred of water, and that for this reason it does some hurt. But what can the hurt be, that it is without Dung? *Galen* interprets it, that to be without Dung, is, not to cause defections, as if *Hippocrates* by these words should give a reason why it causeth not defection: but its not causing of defections is but a weak argument that it self is without Dung; for many things have more Dung, and yet cause defections less than even water, as black and thick Wine: Therefore I suppose, that as he said before that oxymel does greater harm to the Intestin when it is *ἄσπερον*, that is void, of excrements, because these fence the Intestins; so water hurts something because it is without feces, more than it would do if it bred some, for these would fence the Intestins. But *Hippocrates* will seem to affirm falsly, that it causes no defections, because many mens bellies happen to be loosened by drinking of water: but that happens not from any loosening quality that is in the water, but because by cooling and moistning it hurts the retentive faculty in the Guts.

XXVI. The ignorant vulgar suppose that all waters are to be boiled for sick persons, to make them thinner and purer; but the Nature of the thing is otherwise: for by insensible *halitus* or steams, what is thin transpires from the waters in boiling, and that which is thick remains: besides that waters are thereby rendred less grateful to the taste by a certain ineffable and musty relish. But they defend themselves with the authority of *Aristotle*, who (4. *Meteor.*) teaches, That all things wax thick by boiling except water, which because it is simple, its parts can by no means be separated by boiling, as they may in other things that consist of mixture: But I question not, but if water be long boiled, it will grow thick after a sort; for it is not altogether pure and sincere, so that with making a resolution of it by boiling, it cannot be made more sincere, and by consequence thicker, its areal and thin part, whereby it looked thinner and clearer, being resolved. For as it is made worse when it is frozen by the strength of the cold, so also by the strength of heat, which *Hippocrates* proves (1. *de aere, aqua, et locis*) where he says, that all waters from Snow and Ice are bad, because what is clear, light and sweet in them, is separated and lost: Wherefore it seems to me safer to allow to sick persons very clear, pure and long-kept water, than to make it perhaps worse by boiling. But that I may not seem to depart from the received custom, I say those only are to be boiled that have some fault in them which may be amended by boiling: Thus we observe that boiling is good for three sorts of faulty waters, 1. for the fenny and muddy, which *Galen* commands to boil, because when they grow cold, they lose their ill savour, their earthy part subsiding, which before was confused with the whole. 2. That water which displeaseth neither by its taste nor smell, but by its stay in the Stomach is grievous to it and the hypochondres; if it should

not be boiled, ought however to be heated according to *Galen's* precept, as having some fault from the mixture of corrupt air, or containing something that proceeds from an unknown cause, for that is very well put to flight by the vertue of the fire. 3. The last sort is the crude; for as we prepare many, yea most other things that are fit to eat, in like manner we change some waters also into a better Nature, by boiling: *Hippocrates* calls such untamed, as having the sun averse from them, and are taken out of wells, &c.

XXVII. Seeing *Hippocrates* (1. *de morb. mul. sect. 2.*) grants the use of Eggs to Child-bed Women when their purgations flow immoderately, it is a plain argument that they have a faculty to stay or stop, so that the purgations may be suppressed by them: Hence gather, that they are unfit in those Diseases wherein 'tis fitting that the passages of the Body should be open, and wherein the Humours are prepared for an exit: And moreover gather, that their astringent vertue is not obtained by boiling only, seeing *Hippocrates* (in the place quoted) uses rear Eggs and not hard ones for astringing: So 4. *Acut. v. 390.* he prescribes Eggs that are not hard, but betwixt hard and soft, for those who are troubled with a looseness. But the indifferent parts which an Egg consists of are to be noted; the Yelk, whether it be given raw, or roasted, or potcht, does always bridle the motion of the Humours and astringe by incrassating: but the white, whilst it is taken liquid, whether it be boiled till it become like milk, or be raw, does loosen the Belly; for by the vertue of the white, potcht Eggs do loosen the Belly in some: *Hippocrates* uses a raw one out of water in a burning Fever, (3. *de morb.*) because, as he says, it cools and loosens the Belly: Wherefore those do not well for their Patients in Fevers that throw away the white, and use only the Yelk.

XXVIII. Those who generally forbid Fish in sickness, go contrary to the Ancients, Experience and Reason. *Galen* (1. *ad Glaucon.* and 8. *m. m.*) in the cure of an exquisite Tertian and Quartan grants Fish that live in stony Rivers: Likewise (in his Book concerning meats of good and bad juice) he commends them so, that it is certain they cannot hurt sick people; he says they are grateful to the taste, breed good Humours, and that their frequent use is very safe, which he confirms also in lib. 3. *de alim.* *Hippocrates* that is more ancient than *Galen* (lib. *de Affection.*) does also very much commend Fish: the chiefest Physicians have followed these, granting them in sundry Diseases: Reason also consents; for Fish that are easie of concoction, and brittle, do not easily putrefie, nor burthen the Stomach, and by their quality resist a Fever. Some Interpreters of the Arabs say, they are good in Fevers, especially in Cholerick, by reason of their cold and moist temperament; and yet they are not good, in that they easily corrupt and putrefie: which distinction is vain, if so be good Fish and such as live in stony Rivers be chosen, for these are not so easily corrupted, but afford a laudable juice; nor do they nourish very much, but yield a thin aliment to the Body, such as is agreeable to many Diseases; In those Diseases namely wherein meat may be granted, Fish are often to be preferred before Flesh that nourishes more, is more hardly concocted, and yields a more Acrimonious juice to the Body: I mean not every sort of Fish, but the best and the well dressed, as our age knows how to dress them well: and I prefer broild Fish, with the addition of vinegar, juice of Lemon, &c. before broild or fry'd.

XXIX. That which some expect from Crab-fish, Cochles, Snails, Calves, Lung, and other parts of Animals, the more sagacious Practitioners reject; because the natural Balsam that glues the Lungs in Phthical persons, and refreshes the juiceless Body of the Hectick, is not placed in a volatil

Spirit or Salt that is raised by distillation, but subfides in the bottom like earth or fixed Salt, is corrupted and becomes unprofitable. Distillations of flesh *per descensum* are to be preferred, which are fit for the recruiting the Spirits. Let a well flesht Capon be cut into pieces, throwing away the fat, Skin and extreme parts; add, if you please, Veal or Mutton cut likewise, separating all the fat from them: Cast these into a glazed pot, laying under them a wooden grid-iron, that the bottom may be empty; close the pot with a cover and lute it on with dough; boil it in *Balneo Mariae* (or a Kettle of Water) for 5 hours: three or four times a day give two or three Spoonfuls of the clear Liquor that distills out of them either alone, or in some other Broth.

XXX. Our Ancestors used to prepare *Restoratives* on this manner: They took the flesh of a Capon, rejecting the fat, and having cut it into bits, and washed it in Wine, or some Cordial Water, they mixt with it Conserves accommodated to the Distemper or part; also Powders and Waters, adding sometimes some Gold money or a Gold-chain: all which being shut in a glazed Vessel they boiled in *Balneo Mariae*, till the Leg of the Capon were boiled in the Kettle. As for example, in burning Fevers, Take of the Conserves of Violets, Bugloss and Water-Lilies of each an ounce, of the powders of *diamarg. frig.* and *de gemmis* of each two scruples, and six leaves of Gold: put them all in a glazed or glass Vessel that is carefully closed and well stopped with paste or lute, which being put in another Vessel full of water, is boiled till the Leg that was put in that other Vessel be boiled. But there is an error in this manner of composition, in that no respect is had of the Medicines; for they mix raw flesh with Cordial powders and boil them together, forgetting the theorem of him that commands, That such things as require long boiling are never to be mixed in decoctions with such as are more thin and light: For if one boil the Flesh thoroughly, the powders will be burnt; but if they would not have the Cordial and odoriferous powders to be destroyed, the flesh must needs remain raw; and therefore they will never make a good Medicine. Nor is that token of boiling enough to be received; for seeing the Leg is to be boiled a good while, because of its hard and carnos substance, the Powders will not only be spoiled by this token, but the flesh also it self will be too much boiled and dried away. And those that boil Gold-chains, dissolve nothing therefrom but the Quick silver or *fordes*. But we instead of raw flesh take that which is half boiled, or broth boiled for a quarter of an hour, and let them heat and thoroughly mingle in warm water, and then administer the strained liquor: Being thus prepared, it will neither be crude, nor roasted nor boiled too much; as in Diseases of the Breast: Take of the broth of a Capon thoroughly boil'd half a pint, of the water of bugloss and Violet Flowers of each two ounces, of the water of Maiden-hair three ounces, of the Powder of *diamarg. frig.* and *diarr. simpl.* of each two drachms, of *julv. de gemmis* one drachm, and two leaves of Gold, mix them and boil them in a double Vessel for a quarter of an hour, then strain them. &c.

Pondeler.
p. m. 988.

XXXI. It is not good to use *Emulsions* alone either for Meat or Drink. I knew two Infants that died by this means, viz. by giving them always and only all the day long *Emulsions* instead of Drink, with an intent to strengthen and nourish them. Hence I use not even in general to prescribe easily for Infants *Emulsions*, or however not to be taken in any great quantity; for Infants are endowed with a plentiful moisture, a weakly Stomach, fermentiscible and often bilious Humours bred of Milk or Meat corrupted: So also if Patients presume to use *Emulsions* alone, thereby to quench thirst, they easily fall into the other extreme; for it holds

universally, Aliments are not to be confounded with Medicines. Wedel. de
med. comp.
ext. p. 66.

XXXII. Seeing your *fructus horarii* (such as Cherries, Plums, Apricocks, &c.) are profitable to temperate the Summers heat, but are hurtful and dangerous through their easie corruption, they ought to be taken as much cooled as may be; because seeing corruption is wrought by external heat, being cooled they will continue without putrefying till they are concocted, and will temperate much more: On the contrary being hot they do not temperate at all, and easily turn into a salt Phlegm or a serous kind of Choler: whereby it comes to pass, that almost all that eat hot fruits, commonly fall into Tertians or other worse Fevers, and not a few into the *cholera morbus* (or Vomiting and Looseness:) whereas many by cooled fruits are freed from Agues, though otherwise they be occupied in Business and Exercises. All therefore, I think, will greatly commend the custom of cooling your *fructus horarii* by putting Snow to them: for if any find his Stomach offended by the coldness of the fruits, he may know for certain that he needs them not, nor must such an one be advised to eat them hot, but to eat either very little, or none at all. But it is otherwise with Drink, for many are offended by cold Drink, that nevertheless stand in need of that which is as cold as Ice: whence it is manifest that Snow is far more necessary for horary Fruits, than for Drink; though for this also it be profitable for many during the Summer and a good part of the Autumn, but at other times though it may be pleasant to some, yet it is hurtful to all. And therefore I would both begin and end the use of Snow with horary fruits, and in the mean while very much cool the fruits with it, and would have every one take as much as he needs, according to the nature both of the whole man, and also of the Belly alone, which nature is either hot or cold, dry or moist, or some mean between these, and according to the Custom and Experience that every one has of his own Body: But Drink is not alike convenient for all, but for every one his own way, consideration being made according to the same scopes, for thus many things would be profitable that most now dispraise.

XXXIII. As to Fruits, Avicenna pronounces generally, that they are all bad for Persons in Fevers, whom yet all the Greeks oppose. Galen (1. ad Gl.) grants such in the cure of a Tertian as are easily concocted: *Trallianus* prescribes Peaches both raw and boiled, Musk-melons and (*Melopepones* or) Cucumbers, and chides some Roman Physicians that abstained from Pompions because they bred choler, from Gal. 2. de Alim. when yet Galen says in that place, that Pompions breed the *cholera morbus* if they be eaten too plentifully: Yet he prescribes Pompions an hour before the Fit, and also orders the Patient to drink after them a good quantity of temperate Water; for much choler being thereby evacuated by Stool or Sweat, the Ague has ceased: Therefore he adds, In every hot intemperies of the Kidneys, Liver, Stomach, Head, in a Tertian Ague or continual Fever, nothing is better than a Pompion or Cucumber, which latter also he prefers before a Pompion, because it is altogether harmless. Hippocrates himself (in Lib. de Affect.) writes thus of Pompions: The Cucumber-Pompion provokes Stool and Urine, and is light; and the other Pompion does in some kind cool and allay thirst: both of them afford but a thin nourishment, and yet no harm that's worth speaking of proceeds from either. Besides, the sweetness of Musk-melons and their grateful Scent commend them: But we at this day know not what are the *Pepones*, *Melopepones* or *Cucumeres* of the Ancients, and therefore to come to our own: Our Musk-Melons, which many esteem for a dainty, for their admirable sweetness of taste and smell, are yet unwholsom; they easily putrefie in an hot Stomach, for they are very moist, as appears in that from

from a small root they grow into a great bulk; they are presently corrupted by every quality of the Air, and they alwayes lie upon the ground, whence by eating of them, putrid and serous Humours are by degrees heaped up in the Veins, whence Fevers or Agues encrease and are lengthened out, or if they be not present, they are procured, so that these are accounted the most unwholsom of all horary fruits. What some alledge of their sweetness and grateful odour, makes nothing towards their commendation; for this ought to be meant of the same kind of meat, and not of divers, for very many that are most grateful, are more pernicious than those that are less grateful. But our Cucumbers that use to be eat young and unripe, though they cannot be called wholsom, yet they ought to be reckoned less hurtful, both because they have a kind of sowness, and also because they are corrected with Vinegar and Salt; but in the plenty of so many Remedies 'tis better to abstain from them than to run the hazard. To come to other fruits; They are various, hot, cold, moist, easily corruptible, horary, acid, sweet, fresh, dry: The *hot*, when the indication is taken from a Fever, are wholly hurtful; yet in respect to the febrile cause or some Symptom, they may be granted, as *Figs* to cleanse, or if the Colick accompany: The *cold* are good with respect to a Fever, and they profit the Hectick and those that are taken with an *Ephemera* (or a Fever that lasts but for a day;) but though by cooling they may benefit in putrid Fevers, yet in regard of the putrefaction they hurt, because they are easily inflamed and boil in a hot and foul stomach, which is chiefly to be understood of the *borai*, such as Straw-berries, Mulberries, Plums, Peaches, Cherries. Now *borai* (from whence *boraxis* is derived) is the Summer, and the Fruits that are gathered in that Season cannot be kept for their great moisture, but are suddenly corrupted unless they be dried or preserv'd; and all those Fruits that the Latins call *fugaces*, are of a bad juice, and windy, and when they are corrupted, become like to Poisons: But the Fruits which may be kept, as Grapes, Almonds, Damsons dried, and Prunes may be allowed: as also all acid Fruits, as Lemons, Oranges, Pomegranats, for they temper the febrile heat, allay thirst, stir up an appetite, hinder the ascent of vapours: But yet the too great plenty of acid Fruits is to be avoided, because if one take too much of them, or unless they be temper'd by boiling, as they are wont to be when made into Syrups, they breed great Obstructions; otherwise they profit very much by cooling, inciding, resisting Putrefaction. Some also of the *borai* may be granted because they are corrected by boiling and by putting Sugar to them; from which yet if we abstain in bilious Fevers, or at least use it sparingly, it will be better, because it heats and turns it self into choler, as sweet things are wont. So in an exquisite Tertian *Avicen* commendeth sweet Pomegranats, Prunes, the Indian Melon, because it loosens, provokes Urine, allays heat, and moves sweat in some manner. Fresh Fruit also in some particulars is better than that which has been longer gathered, for some Fruits grow musty in time, as Almonds, Pine Apples; likewise these when they are long kept, become oily, and therefore are not so fit in acute Fevers, because the oily part is easily inflamed and turned into choler, and therefore in the Milk which we call Almond-milk we must have great care that the Almonds be not rancid or musty, for the fresher they are, the better. Some boil that Milk, but the raw is better than the boiled, for it cools more because of the admixture of much watriness, which is consumed by boiling, and therefore it alters less and is made thicker, and less apt to temper the febrile heat: On the contrary some Fruits are the better for being cold, as Raisins, Prunes, and all such as abound with too much moisture when they are new, and may

be reduced to a more wholsom nature by being laid up.

XXXIV. *Pot-herbs* and others are profitable in Fevers to alter, 1. Cold, as Lettuce, Endive, Spinach, in bilious Fevers; 2. Hot, as Tyme, Hyssop, Majoran in Phlegmatick; but we must not use them alone, for they have no nourishing vertue in them; or but little; they are rather Medicinal, therefore they are prescribed to be boil'd in Broths, that there may be Medicin with Aliment. The Sick therefore may not have leave to feed upon Herbs and Roots; for most of them use to be turned into a porraceous (or leaky) choler in the Stomach; and *Galen* having dispraised almost all Herbs in relation to food, seems to grant Lettuces only, as being less hurtful: Let them therefore be taken boiled with other Aliments for alteration.

XXXV. Moreover *Salads* are not disallowed of some. *Galen* (1. ad *Glaucon*, cap. 9. and 10.) grants not only Lettuces, but also Garden orach, Mallows, Sorrel: and if Vinegar be added, it will stir up the Appetite, resist Putrefaction, cut tough Humours, open Obstructions: yet but a little Oil is to be added, because it is easily inflam'd in Fevers. But Vinegar being used with Salads or other Meat, in a little quantity, cannot dry much, but rather, according to *Galen*, resists Putrefaction, stirs up Appetite, makes Victuals pass down well, colliquates and attenuates the thick; and so *Olera*, as Cabbage, Spinach, &c. with Vinegar are not so hurtful; they nourish but little, are cold and moist, excite appetite, and being boiled in Broth and prepared or dress'd with Salt and Vinegar, may be good.

XXXVI. *Galen* (in *Arte parva*) commends *Wine* as a Restorative for old Men and such as are recovering from Sickness; but so it is that Wine dries and does not moisten? I answer, that *Galen* allows of Wine of an indifferent age, such as is pure and clear in substance, namely that which is a little yellowish or whitish, smells well, and as to the taste seems neither altogether watry, nor exceeds much in any quality, whether sweetness, or acrimony, or bitterness; but such Wine as this does not dry, but moisten. This we note from this place against almost all the Moderns, who think that all Wine dries: for if the Wine described by *Galen* dried, doubtless it would be bad for Persons recovering from Sickness, and old Men, who are already too dry: therefore we say that the Wine proposed by *Galen* for taking away the dry disposition of Persons recovering from Sickness and old Men, has a faculty to moisten substantially, and is temperate as to heat, and dries not; for no temperate quality can dry or moisten, heat or cool.

XXXVII. It is observable that *Hippocrates* used *Water* for drink in a *drying Diet*, and neither Wine, nor Wine and Honey, though both of these moisten less than Water: which he did, not that he suspected Wine for any reason; for besides that he grants black racy Wine in an exulceration of the Womb, if he had suspected Wine, he should have prescribed some other Drink, and not simple Water. *Hippocrates* therefore approves of Water, inasmuch as it affords very little or no nourishment to the Body, the principal action of which nourishment is to recruit and moisten the radical moisture of the Body which is continually spent, and so it happens by accident that water dries. Add also that Drinks that nourish the Body are sooner distributed through it, and by consequent moisten it, than Water; which because, as *Hippocrates* said, it stays longer in the Hypochondres, it does not proceed so to moisten the Body, as other Drinks that are more pleasant to Nature.

XXXVIII. *Santorellus* (Lib. 26. *Antepr.* c. 8.) admires that *Avicen* has written that *Snow-water* is good, where he says (2. 1. *Doctr.* c. 16.) But *Snow* and *Water* turn'd to ice, seeing it is clean and not mixt with any other thing that

has a bad quality, whether it be melted and Water be made of it, or other water be cooled by it by laying it on the outside of the vessels, or it self be put into water, it will be good. But the admiration will fall, if you understand Avicenna of a Morbous state, wherein if you give Water diluted with Snow, as a Medicine, you will not err.

XXXIX. Those do ill that let many enter into the Patient's Chamber, because the breaths of many People corrupt the Air. Galen (10. Meth. cap. 8.) says that a crowd of Friends heat the Chamber. On that account the Windows are to be kept open, for by shutting them the Chamber is not only heated, but seeing the Putrid steams are not ventilated with the inspiration of pure Air, the Patient falls into a worse condition. And let none object that the Skin is made dense and obstructed by the colder Air; for by the inspiration of cold Air there arises greater benefit to the Patient, than there does hurt by densifying the Skin. But though the condensation of the Skin be the cause of heat, this inconvenience may also be avoided by covering the Patient, and the cold Air being breathed in will cool the internal viscera, for nothing sooner changes the temperatures of the Humours than the Air, as Galen says 3. de humor. comment. 2. Indeed in malignant and continual Fevers there is perhaps no error greater, than to keep the Patients in close hot places, and such as are full of a crowd of People.

Sanctor.
Meth. Med.
V.E. l. 13. c. 4.
See Gal. in
m. m.

XL. To change the Patient's Linnen often seems a hainous thing to the vulgar; for they think that Sick Persons are made weaker thereby. But Hippocrates commands all things to be kept clean about the Sick, and Galen endeavours by all means to keep transpiration free, that cold Air may be breathed in and steams excluded, especially in continual Fevers, which happen for the most part through constriction of the Pores: And therefore when they are obstructed both by the sordes and Sweat, there follows a retention of the vapours and steams, whence the pre-existent Fever is increased, or a new one is kindled: on the contrary that man shall hardly fall into great Diseases whose Body has a good perspiration. In which thing (says Vallesius) vulgar Physicians offend, who will not permit their Patients either to put on a clean Shirt, or change their Sheets, or wash their Face or Hands, or to do any thing else that belongs to cleanliness, not though the Disease be long, or as if this did not encrease all Putrefaction.

Comm. in
l. 1. de vict.
Acut.

XLI. In some Diseases great respect is to be had to the Patient's manner of living, otherwise they will be very hardly cured. A cleanser of Jakes having smelt too good odours, fell Sick, and was at length cured by the smells he had been used to. Zacutus placed a Patient that liv'd by the Sea-side, in the Sand and cover'd him with it, that he might cure him. A Physician cured a Countrey-man, that others had given over, by allowing him Pulse and Rye-bread. And that the Region wherein we live makes many impressions upon us, which we must have regard to, I have observed, that as we that live upon the Land grow nauseous, and vomit in a Ship, which Symptoms cease when we are returned to our accustomed Land; so I have seen a Seaman, namely a Venetian, that endured the same Nausea by riding on Horse-back that we do on the Sea.

P. Boerhaave
Obf. 59.
cent. 3.

XLII. Sleep procured by Art gets the Physician great esteem. A certain Physician said, that the way whereby he curried favour with his Patients, was, that they might have quiet rest the Night after he was called; which he procured with the Syrup of red Poppies, which he prescribed for that Night: I my self also being delighted with this Stratagem, often please my Patients by giving them a magisterial Anodyne. But how comes it to pass that Sleep coming either of its own accord, or procured by

the use of Soporiferous Medicines, is often very offensive to the Sick, who when they awake complain of a great weariness and uneasiness, and find fault with those that wait upon them for letting them sleep so long, desiring them to waken them if perhaps they should drop asleep? I answer, that even the healthful when they sleep immoderately, are said to be soakt, because their flesh is made more moist, and the habit of their Body puff up or bloated, through the suppression of the fuliginous Excrement which ought to be digested and exhale by waking: and the same thing happens sometimes in Persons ill of Fevers: yet we must not therefore abstain either from spontaneous Sleep, into which a man falls when his Spirits are enervated with heat, or from that which is procured by Art; for all the uneasiness goes off in a little while, and the Spirits are refreshed.

- When Sleep does good, when hurt. XXIV.

I. IN an Ague-fit food is not to be given, according to Hippocrates aph. 11. 1. For Nature (as Galen in comm. teacheth) by the concoction of the new aliment is called off from the concoction of the morbidick Humours: And besides, in the Fit all the Body is defiled with an impure vapour, which taints and in a great measure corrupts the meat that is newly taken. But if the Fit be so long, or the Body of the Patient so hot and dry, lean and of so thin a texture, that it is easily dissolved, and cannot hold out to the end of the fit, he must eat somewhat even in the fit it self, which will be better done in the state than at other times, although even in the beginning and augment meat may be given if necessity urge. So Galen. 10. meth. c. 5. in Agues was forced to allow victuals even in the beginning of the Fits, to such as were of an hot and dry temper, who can least indure fasting, lest they should faint away. In imitation of him Amatus Lusitanus (cur. 68. cent. 4.) gave to one in the beginning of the Fit, that vomited clean Choler, (upon

Valle. in m.
l. 1. c. 9.

See Zacut.
P.H. p. 139

R.
iver.

on which he swooned) bread soaked in water and sprinkled with Vinegar and so he hindred the foresaid Symptoms. That hurt which may happen from giving of meat in such like cases, is obviated by giving some Veal or Chicken broth cold; (in France they call it Veal or Chicken water, because it has a middle consistence betwixt mere water and broth thoroughly boiled) for by this means the acrimony of the heat is attemperated, and the imminent driness is hindered; and yet Nature is not called off from her office of concocting the Morbifick matter, which she more easily conquers when the acrimony of the Humours is mitigated, and the fear of driness avoided.

Hippocrates sayes, (aphor. 1. 11.) It is hurtful to give meat in Fits; we must therefore abstain the whole Fit, if it may be; but if not, then till its declension: but if we may not do that neither, however we should avoid the beginning and three hours before, unless in *picnobolus*, or those who vomit up Cholera, who faint away through the acrimonious Cholera that at that time flows plentifully towards the Mouth of the Stomach, unless there be some fresh food there, by the mixture wherewith, it may be dulled; for if meat be put off in these, as it is wont to be in other febricitant Persons, of an intermittent there is often made a continual Fever, and for a simple one, and one that would end with sweat, if meat should be given in the beginning, there ensues a syncopal or swooning one, and for one that would end in health, a mortal. But if meat be given even in the very time of the Fit, it sometimes not only hinders these dangers, but also prevents the Fever it self, which chiefly happens in those that vomit Cholera: Yea and moreover in others in whom there begins to be moved a Cholera that is not so much, thick and putrid, as little in quantity, thin and very adust and fumous, through the twitching whereof the sensible parts begin in many to be pricked and quake; and yet this Cholera, by taking something to eat presently, or perhaps by drinking some Wine diluted with water, is so attemper'd, that they give over shaking or to be feverish at all. But it is certain that this happens seldom, or scarce ever, but in those that are very hot and dry by Nature, for it seemeth to be agreeable to this nature only. ¶ *Oribasius* speaking of old Men says, that when they have Agues, they must necessarily have food allow'd them in the very Fit: for they abound with a glassie Phlegm which in them passes not into aliment; and therefore they must often and importunately be refreshed with meat, though there be instant danger of death.

II. Some Practitioners prescribe *Ptisana* (a very convenient aliment, which tempereth the Blood and Cholera, cuts and detergeth viscid matter, allayeth thirst, takes away the roughness of the mouth and, in general, of all the Pneumatick Organs, makes the Breath ease, &c.) I say they prescribe ptisana with sweet Almonds bruised; yea at the same meal they allow an Egg, Panada and Flesh, against *Galen's* opinion (l. 2. de v. ac.) who sayes that manifold meats and such as are of different faculties cause a perturbation of the Belly. But 'tis answered, those things which are given, either all of them come under the notion of meat, (or at least one;) Then, the Fever is either short, and then 'tis better to give simple meat, or at least to mingle meats together, that are of a simple faculty; or Chronical, and then it is best to give fewer sorts of meat: at the same time yet because the Disease is long, and the Patients cloy'd and queasie-Stomach'd, several meats, as Eggs, Panada, Flesh, Fruits, may be allowed at several times: or some of them come under the notion of sauce which may be mixed with the meat; for the aliment keepeth its proper vertues, and by the sauce is made more

pleasant to the smell and taste, and more effectual against the morbidick matter.

As to the quality of the food, *Hippocrates* declareth (aph. 16. lib. 1.) Moist food is good for all febricitant people, &c. For seeing a Fever is an hot and dry Distemper, by the rule of contraries it requires coolers and moistners: for according to *Galen* (lib. m. m.) cooling is most proper for Fevers; inasmuch as heat is wont always to offend in them, but driness is not always troublesome; and *Hippocrates* himself (lib. de morbis) in several places directs, to cool a Fever as quickly as we can: Seeing this is manifest to all, he makes no mention (in the foresaid aphorism) of a cooling but only of moist food, because it is not so plain, that moistning is convenient for Fevers. By moist food we may either understand that which is moistening, or that which is liquid and may be suppd: That which is moistning is very profitable for Fevers, both because it corrects the driness which the febrile heat accelerates, and also because it tempers the preternatural heat, for driness is the file of heat, and moisture blunts it: That which is liquid and may be supd is alwayes prescribed by him, *Galen* asserting, both because it is the most easily concocted in the Stomach, and also more easily enters into the rest of the Body and into the remoter Veins; for the natural heat being tainted by an extraneous, concocts more weakly, nor is it to be wearied with more solid meats, lest if they remain crude, they be corrupted, and thence encrease the Fever: for which cause we must beware of either roasted or boiled Flesh, which although perhaps they may be potentially moist, yet their substance is too hard to be well enough concocted by the weak heat of febricitant persons; whence Flesh-broth is better than Flesh it self. But though the food ought always to be such as may be supd, yet it should not always be cooling and moistning; for in regard of the cause which is joined with the Fever, or of some other Disease, or Symptom, it should sometimes be hot, sometimes dry, as in Fevers proceeding from Phlegm and Quartans, Pepper is allowed; also if the Fever be accompanied with a Dropsie, the Colick or obstruction, herein we must not use moistners and coolers, but hot openers according to *Galen's* comment on the foresaid aphorism.

IV. Whether are their meats to be seasoned with Salt? *Capivaccius* is against it (l. 6. c. 28.) and altogether rejects Salt: but I think it may be granted, if it be so administered as not to make the meat Salt or powder'd, but to take away its unfavoriness and unpleasantness. First, because that which refresheth, nourishes, according to *Avicenna*: and most meats are unsavory without it, whence they do not only not nourish, but they also cause a nausea, whence other harms spring. Secondly, Salt Meats, according to *Galen* (3. de al. fac.) cause dejection and open obstructions: Himself (7. m. m.) in the cure of a dry Stomach grants salted Bread; and by a stronger reason it is agreeable for febricitant persons. Add hereunto Aphor. 2. 38.

V. Whether is Milk to be granted? It seems to be hurtful, both by reason of its cheesie substance which turns into nidour, encreases thirst, fills the Head with vapours, encreases the fervour, and causes obstructions; and also of its Buttery part which is apt to be inflamed through its fatness; *Bilious* proceeds from fat, says *Hippocrates* (6. Epid. 5. 14) and lastly of its serous part which partakes of a nitrous quality. Milk is either used as nourishment, in which sense it is condemned by *Hippocrates* aph. 5. 64. or as Medicine, especially that of Asses, for this being more watry may be drunk even in a burning or continual Fever, according to the prescription of *Hippocrates* (l. de rat. vict.) or it is used for refrigeration, or for evacuation by stool, but in a great quantity, for so it descends more quickly, and makes

Capivacc.

P. H. p. 539.Pri airof. lib.
de feb. p. 153.

makes no stay in the Stomach, so that hence it is neither concocted nor assimilated; It washes down the choler, purges out the fifth of the Guts, moistens and greatly cools.

VI. 'Tis doubted whether *Fruits* be good. *Avicenna* says they all do hurt by their ebullition and corruption in the Stomach: *Galen* writes that no Fruit almost is of a good juice, but that the *fugaces* or horary have plainly a bad juice, so that unless they be quickly cast out by stool, or if they be corrupted in the Stomach, they breed a juice not unlike to poison: others on the contrary grant several Fruits, especially the cooling, as Melons and the like. But we must know, that if any fruits are granted, they are granted rather as Medicine than Aliment: And it cannot be denied that most of them are easily corrupted, especially in a Stomach indisposed by a febrile heat, and that vicious Humours are thence generated that very much encrease the Fever: And by how much any fruit is otherwise the apter to be corrupted, by so much the easilier is it corrupted in Fevers: for most of them do not transpire well, yea hinder transpiration, as Melons: but if our Patient be so dainty that we must indulge them, we must rather permit them to taste them than to eat them freely according to *Galen* (1. ad Gl. 9.) otherwise that food is to be appointed which *Hippocr.* prescribed, viz. of the juice of *Pistia*, till the crisis, or some such like. Yet acids may be granted more easily, to extinguish too great thirst and heat, such as are Pomegranats, Citrons, Lemons, Barberries, or their juice, Gooseberries, Cherries; all which yet are rather aliments than Medicines. *Sennert.* See *Zac. P. h. l. 4. c. 3.*

Sennert.

VII. Some quite reject *Fish*, as easily Putrefying, others admit them: but here is need of a distinction of Fevers and Fish; for Fish are more fitly given in Choleric Fevers: Yet alwayes such are to be chosen as yield a better nourishment, as those that live in stony Rivers.

VIII. *Saxonia* says, 'tis a heinous thing at *Venice* to give febricitant People Eggs: And of Flesh 'tis observed, that those who eat it in Fevers dye, in *Crete* and other places of *Greece*. *Sennertus* grants them both; Eggs, because they are of easie concoction and good aliment, and because Men in these Countreys, being not accustomed to that thin Diet to which the Ancients were, do bear them well enough, without any encrease of the febrile heat, or avocation of the natural, if so be they be given in a little quantity and in due time: And he rejects not the use of *Flesh*, although it hurt in *Greece* because of the notable heat of that Country, and because Men there do easily tolerate a thin Diet, whereas the more Northern People that are accustomed to a thick Diet eat it without harm. Yet *Dr. Tho. Willis* has observed that the eating *Flesh* and Eggs prolongs Fevers. Likewise *L. à Fonte* (Conf. 5.) disallows of Eggs, 1. because, according to *Hippocrates*, a full Diet (such as Eggs afford) is not convenient in the beginning, augment and state; 2. because foul Bodies are not to be nourished with meat that easily putrefies; but Eggs are such because of their too great moisture; 3. because, according to *Alexander 2. Probl. 84.* the yolks of Eggs heat, &c.

IX. There is no reason Physicians should stick so much at granting crude Lettuces to febricitant Persons, and make them eat them alwayes boiled, especially in the Summer: for indeed they have hardly any hurtful quality but cold and moist, whence the too great use of them may fill the Belly with too much moisture and weaken the Stomach; and perhaps they will sooner do this harm boiled than raw, contrary to Coleworts, Bete, &c. for these having a malignant and nitrous quality want boiling to correct them; but Lettuce having

none, it needs not so much as washing to prepare it for eating, and it is made looser and exsolvent by boiling. *Galen* (2. de alim.) having for a long time formerly used raw Lettuce, says that he began to use boiled for no other reason but that his Teeth were worse.

Vallef. 7. Ep. p. m. 881.

X. Those who advise to pour upon their Meats the juices of Pomegranats, Citrons, Lemons, unripe Grapes and other things of like quality, are not approved by me, because these things have no regard to the obstructions which are the chief both cherishing and efficient causes of the Fever.

P. Salus D. de feb. pestil. c. ult.

XI. But as these astringents are not approved by me, so are sweet things condemned; both because these destroy the Stomach, and also easily turn to Choler, whereby the internal burning may be encreased: wherefore let all things that are prepared with Sugar be here omitted; and let that great and continual use of Sugar, which is ordered by many that Practise Physick ill, be avoided.

idem ibid.

XII. *Pistia* or Barley-broth is greatly commended by the Ancients in acute Fevers, not only because it cools and moistens, but chiefly because it takes away that asperity or roughness that is introduced into all the Body by the febrile heat. That a Remedy may be able to take away asperity, 1. it must be moist; 2. it must not be biting; 3. it must have a lentor or clamminess: and such is *Pistia*: hence Vinegar, though cold, is not good for febricitant Persons, because it exasperates, whence the Fever becomes harder to cure.

XIII. Wine seems not to be good in Putrid Fevers, because it nourishes very much, encreaseth thirst and pains of the Head, affects the Nerves, &c. yet *Hippocrates* was very daring in the use of Wine, as is manifest in his Book *de acut.* and in other places. *Alexander* (2. probl. 62.) grants a little and thin; and not undeservedly, for White-Wine, that is thin (especially in those that are used to it) when there appear signs of Concoction, is good, after other evacuations, to concoct the remainders of the Humours, to provoke Urine and Sweat, and Sleep. *Galen* (2. de acut. 8.) writes that it was a custom in *Italy* to grant *Sabine* Wine, that was thin, to all febricitant Persons: yet in the same Book 1. 40. he confesses that he used to indulge to his Patients a little Wine diluted with clear water, though 11. and 12. meth. and 1. ad Glau. 14. he admonishes to forbear, if there be a suspicion of a *delirium*, or if there be an heaviness of the Head or a Catarrh, or the Morbifick matter be crude, or be concocted but plentiful, no evacuation preceeding, especially in continual Fevers, unless the Patient be ready to faint away. And we must not chuse red, but white, and that not yellow, but thin, watry or diluted with water; not sower, or sweet, or thick; and 'tis rather to be granted to those that are accustomed to it, than to the not accustomed: In slow or intermitting Fevers more liberally, but in others more sparingly and very watry; not for the Fevers sake, but the cause, whilst by accident the more intense heat attracts to it self the more remiss, and consumes by inciding and dissolving; or for the accidents, as to strengthen the faculties, &c. *Galen* in his Book *de cib. boni & mali succi*, c. 8. says, *White-Wine that is harsh, hath a sensible vertue to cool.* Which is to be understood, not in respect of other Wines but absolutely. Therefore all Physicians almost now a days do err that will not allow any Wine to febricitant Persons. Let other places of *Hippocr.* and *Galen* be considered, as 3 de rat. v. 7. and 8. and 6. Epid. 4. t. 15. and elsewhere *Galen* commends watry harsh Wine to People in Fevers: where it is forbidden when the Disease is crude, it is to be understood of the yellow, and not of the white and watry. As for my self when I find a small thin Wine, I allow a little to my Patients, although febricitant, safely and with

Horst. de febr. quest. 9. exercit. 4.

idem ibid. 2.

with great benefit. *Sanctorius* (art. parv. cap. 100.) gave it even in a malignant Fever: *P. Poterius* (cent. 1. cap. 81.) says, because there are many Fevers, for which Wine is not at all ill, especially for those which have their seat in the Stomach, if so be such Wine be given as disturbs not the Head, though in a pretty quantity, it sometimes effects a cure, according to *Primrose* l. 3. de vulg. err. in Med. cap. 18. The same person adds: The propriety of a man has great power in the cure of all Diseases; and there are some so very much addicted to Wine, that even in the extreme Sickneses they cannot abstain from it. Add to these *Canonberius*, of the admirable vertues of Wine, who (Lib. 1. cap. 3. §. 18.) writes thus, We may use Wine in Fevers and as Aliment; and §. 25. Wine procures Sweat, and by it not a little of the serous matter is carried forth by Urine. Let the Reader compare with these, *Costeus* in *Tract. de Potu in morbis* lib. 2. *Hippolyt.* *Obicius* & *Hipp.* *Antonellus* in *apparatu Animadv.* upon the same.

XIV. *Hippocrates* greatly disallows of Water for ordinary Drink, and as much commends it as a Medicine, namely when drunk in a large quantity. Now he says it hurts in ordinary drink, because it is thick, passes not through the Hypochondres, and in cholerick Persons easily turns into choler, for being conquer'd by the febrile heat it easily Putrefies, otherwise because it is cold and moist it is wholly contrary to the Fever, and therefore is good for it. In those therefore who are used to drink Water, I see no reason why it may not be granted; but it will be better if it be corrected with the mixture of other things, yea it may be boiled to make it the thinner: Some will have it distilled, and then to be temper'd with the mixture of cooling and opening Syrups; some would have Bread so soaked in it that it may a little imbibe the vertue of the Ferment; others would have Cinamon infused in it, &c.

XV. Beer, although it be small, yet it always has some faculty to heat and make drunk, although that vertue be less and weaker in small than in strong; whence it is not so good for those that are in acute Fevers and whose Head aches, because it inflames and causes thirst if it be drunk plentifully, as Febricitant Persons use to drink that are very dry. You will object that Beer is only Barley-water, nor does it acquire any quality that is adverse to a Fever from the addition of Hops, seeing Hops are usually prescribed to deplete the Blood. But Experience teacheth that there is a great difference betwixt Barley-water and Beer, seeing the Water cools, and drink as much as you will it never inflames nor disturbs the Brain, nor causes thirst; which cannot be said of Beer even though it be small. And the difference depends upon this, that Beer is not made of simple Barley, but of Mault, (which is Barley steep'd and dried) and dry Hops are added which heat sufficiently; then it is fermented, whence it acquires an hot quality, which is not in Barley-water nor Ptisan; and therefore it seemeth to me not so good: Yet its use is better to be born with than that of Wine, because it is less hot, and is Diuretick. Add, that a Spirit is drawn even from small Beer.

XVI. In giving Drink to People in acute Fevers, 'tis fitting to use a measure, lest on the one hand by too much moisture, which is improper for Febricitant Persons, there spring either a greater crudity, or a fouler and longer Putrefaction; or on the other side by too much driness the accidents be increased and the Body consume: Yet this one thing is worth noting, that Drink being mixed with Meat is easier concocted, doth sooner refresh, and doth less burden weak Nature; whence it comes to pass that on the first day of an acute Fever we may forbid all moisture, unless the Patient be so weak that on that account Food is necessary: but on the last days, when driness and burning are urgent, we must give Drink more freely, especially if there shall be manifest concoction.

XVII. Drinking in the Fit of an Ague is very hurtful, for hereby just like as when Water is thrown upon a red hot Brick, there is caused such an ebullition of Humours, as that both the Disease and the Symptom, thirst, are increased. ¶ And yet we ought not pertinaciously, as some do, adhering to the indication from the cause, neglect the intemperature; for it is better sometimes to let the Disease be prolonged, than that a man should be presently burnt up. ¶ I have found by Experience that hereby there have often sprung continual and mortal Fevers of intermittent ones and such as have been void of danger.

XVIII. In continual burning Fevers, the effect is commonly more urgent than the cause, the Symptom than the Disease: when therefore burning, and troublesome thirst are grievous to the Patients in those Diseases, it seems reasonable to give them their Drink cold, and in that plenty, that it may temper the boiling Humours and extinguish the fervour of the Spirits. To this *Hippocrates* has regard, whilst in many places he commends cold Drink: thus l. de vict. ac. both in the *Causus* or burning Fever and *Quinsy* he gives cold Water: In lib. 4. *Epid.* he says that in acute Fevers 'tis profitable to give cold Water: In 2. de morb. On the second day after the beginning of the Fever, you shall give him as much cold Water as he'll drink: again 3. de morb. he prescribes cold water even that hath been exposed to the open air. But l. de Loc. he says, For Drink you shall give warm water, and water and Honey, and Vinegar with water: for if the drink be not received in cold, being and remaining warm it will detract from the sick Body, or either will eject by Urine, or will dry: There namely he is more intent upon the cause of the Disease. For drink is given in Fevers upon a double account, either that it may be a vehicle for the food it self; and this should be cold: or for the alteration or exclusion of the Humours, and here warm drink is commended, as also if the Body have not been accustomed to cold, or if the Stomach be cold.

XIX. Give cooling potions to drink in burning Fevers, when you will, says *Hippocrates* 3. de morb. v. 69. Note that *Hippocr.* said not, when the Patient will, but when you, the Physician, will, that is, according to the regulated will of the Physician, and not the perverse will of the Patient. Now these potions are of different operations, for some cause pissing, others going to stool, some both, some neither; some cool only, like as when one pours cold Water into a Vessel of boiling Water, or exposes the Vessel it self full of Water to the open air: Therefore you shall give some to one, some to another; for neither are the sweet, nor the bitter agreeable to all, nor can all drink the same. *Hipp. ibid.* For those sick of a burning Fever do not always require the same way of cure, seeing some want greater cooling, as being of an hard and dense habit of Body; others less, as being of a soft and rare habit: the same coolers are not fitting for all, but one must be given to one and another to another with respect to the Disease, and according to the diversity of the habit and other circumstances. Which opinion of *Hippocrates* if those that commonly practise Physick would attend unto, they would not always inculcate the same things in the same Diseases to all Patients; but when the poor Patients from their proper Nature do often refuse either sweet things, or sharp, or sour, and are set against them, they should lay aside their pertinacy and indulge their Patients Nature and will with variety of pleasing Medicines. Amongst the various drinks prescribed by *Hippocrates*, this is remarkable: Put three or four whites of Eggs in a gallon of water, and having shake't it well, use it for Drink: it cools greatly, and inclines the Patient to stool. Perhaps these whites of Eggs do the same thing here, as they do in Wines when they become too thick, and putting off their proper Nature grow vappid: for

Primros de febr. p. 146.

Idem.

Merc. lib. acid. 1. 2.

for if Eggs being well beat in a good deal of Water, be poured to such Wines at first, they notably rarefie and attenuate them and restore them to their pristin Nature: namely being put into the Wine they cool it, and by drawing the thicker parts to the bottom of the Vessel they attenuate it. The like whereto I suppose to be done in a burning Fever, because they cool by contempering, and by drawing down the excrements to the lower parts they loosen the Belly: but let them be crude, for the boiled have less of the foresaid faculty.

Morb. p. 339.
and 347.

XX. I know the use of Barly water is condemned by some very famous Physicians, affirming it to be the invention not of the Greeks but Arabians, that it is windy and offensive to the Stomach. 'Tis apparent such are little versed in reading Greek Authors, from lib. 3. de morbis where Hippocrates advises to take about a pint of large and full Achillean Barley, and when it is dried to take off the hawns and wash it well, then to put a gallon of water to it which must be boiled half away, and when it is cold given to drink. It is not true that this drink is windy, seeing the *flatus* are in the substance of the Barly (which being not well concocted reserves its *flatus*) and not in the water; but the water and not the substance of the Barley is given: and if there were any fault before in the water, it loses it in boiling, for boiling takes away the malignity of many things. Whereas it is said to be offensive to the Stomach, it is not so to all Stomachs, but only to those which are more cold; but it will not be hurtful to others, but rather a safeguard and shield, when the febrile heat abounds and is fervent: wherefore such offence will not be on the part of the water, but of the Physician that administers it without distinction, and has no respect to the Stomach of the Patient. I declare that I have found the use of this water profitable in our art, and have given it plentifully, but not to all alike and without distinction: I have given it in burning Fevers, when signs of concoction appeared; cold, when the Stomach was strong; warm, when languid; and in great plenty, even as long as they would drink it: In other bilious Fevers in the last part of the state, more willingly in the beginning of the declension, especially if the Intermissions come every third day.

de Morb.
p. 342.

A. Ferrer.
castigat.
cap. xi.

Fennert. lib.
de febr. c. 9.

XXI. I wonder what some mean in giving Water in Fevers; when they order it to be boiled long and much; seeing as Galen testifies (which sense also confirms) by long boiling it acquires a Saltiness, and at length, like other things, a bitterness; whence it will happen that the febrile heat will not be extinguished, but rather encreased by it.

XXII. Those err who grant Water through the whole course of the Disease; for then it hinders the concoction of the Humours, it is difficultly concocted, and stays long in the Belly before it be distributed; it neither cuts, nor cleanseth, nor of it self loosens, nor provokes Urine; therefore it is not to be granted save in the acute, in the state, when concoction is finished.

XXIII. 'Tis a doubt whether the Sick should be nourished more in Winter than in Summer. For Hippocrates 1. apb. 18. and 3. de dieta hath expressly taught, that febricitant Persons do easily endure Meat in the Winter, not so well in the Spring, least of all in the Summer and Autumn: In the Summer namely the Sick do worst of all endure Meat, because not only the Belly is rendred more sluggish in respect of its office, through the driness of the Disease; but the natural heat is then at a low ebb: but in the Winter most easily; for though the Belly be then also rendred sluggish, the Disease remaining dry even then, yet the natural heat is increased, whence Meat may be more easily endured in the Winter than in the Summer and Autumn. On the contrary

Avicen (1. 4. Cap. de cib. agrorum) says, that the Sick are to be fed in the Winter, but more in the Summer: he gives a reason, because in the Summer there are greater resolutions, whence consequently for the restauration of what is lost, there is need of more Aliment. To resolve this, we must note from Mercurialis (1. 5. de febr. c. 8.) That Aliment may be said two ways to be more or less; either as to its vertue, or as to its bulk: In the Winter indeed our Bodies should be nourish'd more as to the vertue and strength of the Aliment, but more in the Summer as to its bulk. The reason is, Because the substance of the natural heat is greater in the Winter, and less in the Summer (1. apb. 8.) because then much (Pituita or) Phlegm is collected, which is the Aliment of the Blood and natural heat: Hence Galen hath placed the substance of the natural heat in the Blood and Phlegm; therefore strong Aliment is fitter in Winter than in Summer: But in the Summer when the preternatural heat is greater than the natural, and upon that account there are great resolutions of the Body, it comes to pass that it needs Meat indeed for the recruiting of the wasted strength; but that Meat ought in no wise to be so strong: Which when Galen saw, he said that our Meat was to be divided into divers Portions, which Avicen also approved of; but that in Winter it was sufficient to eat once or twice a day, because in that Season it is better concocted, and the Excrements are generally fewer.

L. de placit.
Hipp. & Gal.

1. apb. 18.

Gr. Horstius
Exerc. 4. de
feb. qu. 3.

XXIV. Concerning Sleep we must note 1. That Sleep is always hurtful in the beginning of a Fit, because then the faculty is strong, and the cause of the fit intire and not evacuated as yet nor lessened; wherefore it neither needs retraction of the heat nor union: nay if the heat be then withdrawn, the faculty is more oppressed through the multitude of the Humour, and the heat is made more preternatural, and is defiled through the commerce of the Humour and vapours, and by this means the Fever is prolonged, because its cause is not dissolved, yea it remains in the Body too fixed and rooted when it does not exhale to the outer parts. But in the declination it is always good, for the faculties being dissolved and wearied from the foregoing terms (viz. the beginning, augment and state) they desire rest and firmitude: moreover the cause of the Fit is now overcome, dissolved and turned into vapours, which when they are dispersed to the outer parts and are distant from the principal parts, are not so easily retracted. If sleep therefore come upon the Patient then, it refreshes the faculties, seeing now that the load is taken off they are not oppressed; yea by the Blood and Spirits retiring to the inner parts, the faculties being collected and more brisk end the Fever, or stoutly shatter the reliques of the Humours. Sleep in the state is doubtful, for it sometimes does good, sometimes hurt, which flows from the various disposition of the Body and diversity of the Fever: for if the Body be hot and dry and prepared for resolution, then sleep is profitable in the state of the Fit, for it moistens, refresheth the faculties and makes the fit shorter: On the contrary if the Body be hot and moist, of a dense habit, sleep is unprofitable, for then there is neither need of refection nor moistening, yea if it come, the resolution of the morbid cause is hindered, and the state and declination are prolonged. In like manner we must think as to the diversity of the Fever, for if the Humour do more offend in quantity than in quality, such as are the Phlegmatick, the Melancholick or the bastard Tertian, then sleep profits not, but hurts: On the contrary if the Humour offend and urge more in quality than quantity, as a bilious Ague that springs from sincere choler, so that by its thinness, heat, and Acrimony it presses and wearies the faculty, then sleep is profitable. The same is to be said of the last part of the augment,

ment, which 'tis certain represents the nature of the beginning. We must Note 2. That this doctrine is to be understood not only of the particular termes of every Fit, but of the universal : for in the beginning, because Nature is oppressed, Sleep is not so convenient, but 'tis more convenient in the augment, and far more in the state, but most of all in the declension, for by its help the Spirits are refreshed, and the reliques of the Humour are concocted and wasted. This is the cause why the longest Sleep is granted in the declension, in the beginning very short, and in the middle terms indifferent : But if sweat be at hand or break forth in the state, Sleep helpeth greatly, if signs of concoction go before : for Sleep hinders all evacuations except sweat, which it promotes.

Diaphoreticks.

(See Alexipharmacks and Sudorificks.)

The Contents.

How they act. I.

Such as absorb. II.

Such as make the Serum fluxile. III.

Such as hinder its coagulation. IV.

A Diaphoresis is not to be procured by externals alone. V.

The same are not convenient in all cases. VI.

The more temperate are sometimes the more available. VII.

They are sometimes hurtful. VIII.

They are to be avoided where the Serum is either too little or too much. IX.

What things hinder their use. X.

Acids help the vertue of Sulphureous. IV.

I. **D**iaphoreticks and Sudorificks differ from one another in degrees ; the former discuss halituous excrements by insensible transpiration, and promote the same transpiration and ventilate the Blood ; the latter do this also, but leave a more manifest effect by a dewy sweat. And they operate inasmuch as they fuse the Blood, and procure a separation of the Serum from it, that it may be expelled through the pores of the Skin in the form of Vapours.

II. Both 1. by absorbing, and resolving that which binds the serum and makes it more fixt, as the more fixed alkaline, and earthy Medicines, for instance, Antimonium Diaphoreticum, Shells, Harts horn burnt, the Bezoar stone, Bole-Armene, Bezoardicum minerale, &c. these do greatly precipitate the fermentation of the Humours, and set insensible transpiration free and at liberty.

III. And also 2. by making it fluxile, whether by rarefying of it, and inducing a new fermentation on the Blood : Thus 1. lixivial and nitrous Salts, Salt of Wormwood, Carduus Bened. Centaury, which both absorb, and also make the serum fluxile ; thus 2. Volatils, the Spirit of Harts-horn, of vipers, of Ivory, do very powerfully drive forth sweat ; or by yielding an halituous vehicle and volatility, such as are 1. the aqueous, as divers distilled waters, and especially some decoctions that enjoy also a certain volatility ; also 2. those that are easily resolvable because of their watry and Gummy substance, as the rob of dwarf-Elder, Elder, &c. but chiefly 3. those that are indued with a volatil Salt intimately mixt with a Sulphur, the bitter resinous, &c. so card. bened. opium, Camphor, the Wood Guaiacum, and amongst compound Remedies Treacle, Mithridate, and the rest mentioned in the first class, these promote the sluggish motion of the Se-

rum, and put nature upon discussing superfluities, opening the Pores, and vigorating the mass of Blood. And these have place chiefly in a Rheumatism, or any flux whatsoever of the Blood and Serum, for instance in the Inflammations of the Pleura, fluxions of the Joynts, &c. whence they are good in the Pleurisie, which has often its Throat cut as it were by some eminent Sudorifick in the beginning ; in the Gout, which is helped most of all by the same sweats ; in Tumours of the Groins, Tonfils, Armpits and the like ; in Fainting, Swooning, both solitary and hysterical ; and when the Small Pox or Measles come not out well.

IV. Likewise 3. by inciding the curdled serum and promoting the fermentation of the Blood also by this very means. Those Medicines that perform this are chiefly acids, and alkalines also after their manner, to wit in a different respect : hence vinegar as likewise other acids, are deservedly reckoned among sudorificks. For it is an observation not to be slightly esteemed, that Sulphureous Medicines by the accession of acids do far more readily act, and procure sweat more than when left to themselves : the *mistura simplex* alone may serve for an instance ; for neither the Spirit of Treacle of it self, nor the Spirit of Tartar do so readily procure sweat, as when the Spirit of Vitriol is joined to them, for this doth promote both their activities : So also the tincture of Bezoar without the addition of the Spirit of Salt, or some other acid, is less apt to cause sweat. Now when the Blood curdles, it becomes more gross, viscid, thick and glutinous ; whence acids, by taming the Sulphur, and hindring rarefaction as much as may be, do in such case promote the separation of the serous Humour, and by this means promote also its halituousity. Whence these and the Diaphoreticks of the first class are profitable (being choicest according to the diversity of Indicants) even in divers kinds of Fevers, especially also in the Pox, Scurvy, Leprosie, and the like, where the Blood being much too glutinous doth necessarily import a weight and pain of the membres. These very Medicines also of this class have a great vertue to take away the grumousness of the Blood ; whence also the *mistura simplex* has no contemptible use in the palpitation of the heart it self, also in the scab and many other maladies. In a word, in any faults of the mass of Blood, arising from the quality and vitious excesses in motion, ebullitions, despumations, &c. diaphoreticks bear away the bell, both restoring and depressing the ferment.

V. But inward Impellents have need of externals ; whence it is not enough to take a Diaphoretick Medicine, but at least there is need that the ambient air should be warmer than usual and that the Body be cover'd, as also that the pores be more dilated and the Humours fused : But the business is never accomplished by externals alone, unless when the matter sticks more betwixt the Skin and Flesh ; for in that case external impellents do more good : Likewise when a particular tumour exerciseth and wearies some membre, the same are useful.

VI. Nor avail they only in the abundance and repletion of Humours and impurities of the Blood ; but they also make the sluggish Humours more brisk and lively ; but they are chiefly good for resolving and attenuating of serous Humours, and evacuating them by the pores : whence the fixedness or volatility of the Medicines, and the different state of the Blood varies their use. There are some who always use antimon. diaphoret. only ; others cry the Spirit of Harts-horn up to the Sky ; others use the tincture of Bezoar, especially the camphorated, almost for all cases : All these offend, but chiefly the last ; for all cannot endure alike camphorated Remedies, at least in so great a dose as greatly rarefies the Blood. Camphor hath a no-

B b b b b

table

table place in invigorating the motion of the Blood, but not where it is too much rarefied and Boils, for in such cases it makes the watching, thirst and heat to be greater; whence it is better to use the tincture of Bezoar not so much camphorated, or rather to have some other milder at hand.

VII. Whensoever therefore resolution of the strength is feared, and the Blood stands more in need of a Bridle than a Spur, the more temperate bear away the bell and are to be preferred; and on the contrary. So especially *Hofman* observes, that in a certain Epidemical Fever, joined with a colligative Sweat, Bole-Armen, and sealed Earth were the only Remedies. But if any should give the same alone to promote the motion and fermentation of the Blood, he would make himself ridiculous.

VIII. Where there is more need of Precipitation than Discussion, the Patients are to be less compelled to Sweat; yea Sweat being too much forced does less good, even in continual Fevers. Hence those do egregiously err in their Practice, who in Tertians and Quartans by giving a febrifuge Powder before the Fit, do continually prompt and almost compel their Patient to Sweat; from whence we have observed that a fear of a Consumption and other no light Symptoms have sometimes arisen. Hence in driving out the Small Pox, also in malignant Fevers it is never adviseable to force the Patients too strongly to Sweat, for by this means the Serum is too much consumed, the Blood it self is more excited to ebullition, and the endeavour of Nature that is acting aright, unseasonably precipitated; and therefore 'tis better to continue a Diaphoresis or gentle breathing, and to give Nature time, than spoil all by forcing; it is better to follow her, to lead and not drive her: that which Sweat performeth not, a thin dewiness does.

IX. They are less profitable wheresoever Serum is wanting; yea and if it exceed, they are not so good neither: for as, when it fails, Hydroticks do more exhaust it; so when it is superfluous, they cannot alone conquer and evacuate it: Hence for example, in the distracted and other cholerick Persons also the rule now given holds: whence in that case either the more temperate only are to be chosen, or they are not to be given without watry vehicles that increase the Serum substantially; which very thing holds of the drier sort of People in general: Hence in hydropical Persons Diureticks and Purgers do more good than Diaphoreticks.

X. In Phlegmatick Diseases, and where the first ways abound with vicious Humours, and these are fixed there as it were, they are not so good. Hence Purgers and Vomitors are more universal Remedies as it were; and after these, when the thicker and more viscous Parts are taken away, the thin that remains is more fitly evacuated by Diaphoreticks. Hence in all Fevers indeed Diaphoreticks profit greatly; but in the intermitting that is diligently to be observed, especially in the Quotidian: The same thing is to be noted also in the Scab it self; and in a Cachexie Diaphoreticks have but a secondary place, lest they coagulate the Phlegm or Serum more that is already coagulated and too thick, lest they disturb the Humours, and more increase the impurities of the Blood, which they should take away.

The efficacy of volatil Salts. XXIV.

Tartar requires but small Preparation. XXV.

How the Roots of Alarabacca become Diuretick. XXVI.

Some are gentle, some strong. XXVII.

When the stronger are to be used. XXVIII.

I. **T**HE Origins of many Diseases happen for want of a due separation of the Serum: but as to this separation, seeing there are faults of divers kinds, the offence is for the most part either in defect or excess: for sometimes the Serum does too pertinaciously adhere to the Blood; and on the contrary, sometimes it parts too soon from it, and in this regard the Blood being not able to contain the Serum doth spue it out of the mouths of the Arteries in many places and almost every where; and so depositing it in the viscera or the habit of the Body, procures an *ascites* or *anasarca*, and sometimes sending it off immoderately to the Kidneys it causes a *diabetes*. When the Blood is too tenacious of the serum, for the most part it is either over hot through a Fever, having its compages too strict, and the thicker Particles so incorporated with it, that the thinner cannot easily get therefrom; or being filled with scorbutick Salt and Sulphur, it becomes very clammy and tenacious, so that the serosities do difficultly slide out of the embraces of the rest. And seeing the departure of the serum from the Blood is hindered or perverted so many ways, Diuretick Medicines also are of a different Nature and Operation, which yet may be distinguished 1. as to the End, according to which they respect the mass of Blood, or the Kidneys, or both together; 2. as to the Matter, in which respect they are either Sulphureous or saline: And these again are various, according as the saline Particles are in a state of fixity, fluor, or volatility; or are moreover nitrous or alkalizate: 3. As to the Form, these Medicines

Medicines are of divers kinds, Drinks, Powders, &c.

II. When the Blood, through an incorporation and mutual combination of the fixed Salt with the Sulphur and Earth, becomes so thick and tenacious, that the watry Particles do not easily part from the rest, the Diureticks which may loosen its compages and fuse the serum, must be of such a sort, as are endued with a volatil or an acid Salt; for such Particles do chiefly dissolve the combination that the fixed Salt has entered into: And seeing this disposition is common both to the Fever and Scurvy, in the former the most proper Diureticks are both the temperate acids of Vegetables, and also the Salt of Nitre, the spirit of Sea-salt, of Vitriol, &c. likewise those endued with a volatil Salt, as the spirit of Hartshorn, of Sal Armoniack, the Salt of the juice of Vipers. In a scorbutical Disposition, when the Urine is both little and thick, the juices of Herbs, and both acrimonious and acid Preparations are of notable use: also the salt and spirit of Urine, of Sal Armon. of Tartar, &c.

Idem.

III. Sometimes the Blood keeps not its serum long enough within its compages, but being subject to fluxions or rather coagulations, and depositing the serum here and there in great plenty, it raises Catarrhs or Tumours in divers places: Or the Blood being habitually weak and withal dyscratick or intemperate, namely inclining to sowness, is apt to coagulate as to its thicker Particles; so that in the circulation the thinner being thrown off every where, and falling upon the weaker Parts, cause sometimes Cephalick or Thoracick Distempers, sometimes an *Ascites* or *Anasarca*; and from a like cause we think a *Diabetes* also springs: For many dangerous Diseases, which are mistakingly ascribed to the dyscrasies of the *Viscera*, arise from this cause: namely inasmuch as the Blood being of an evil temper, and liable to coagulations, cannot continue the thread of the circulation entire, but in divers places deposits the Serum that is too apt to depart from it. The Diureticks to be administer'd in this case are such as do not fuse the Blood, but take away its coagulations, as are those endued with a fixt, volatil, and also an alkalizate Salt; moreover those that strengthen and restore the Ferment of the Kidneys, as some sulphureous and spirituous. For these purposes are sulphureous, and mixt Diureticks, the lixivial Salts of Herbs, Shell-Powders, the Salt and Spirit of Urine, &c. Hog-lidge, the roots of Horse Rhadish, the seed of Smalledge, Nutmeg, Turpentine and its Preparations, the spirit of Wine, the vertue of all which is not to fuse the Blood, and to precipitate the Serosities out of its mass (these things acids chiefly do, and in those cases often hinder making water) but to dissolve the coagulations of the Blood, so that its compages recovering an intire mixture, and being circulated more quickly through the Vessels, it reabsorbs the Serum that was every where extravasated and deposited, and at length delivers it to the Kidneys to be sent off. We shall shew afterwards how the Diureticks of every kind operate according to these two almost opposite ends of curing.

IV. As to saline Diureticks, we must know, that what Salts soever of a different state are mixed together, do catch hold of one another, and by and by are joined together; and while they are so combined, that other Particles which are loose from the mixture, do retire by themselves or fly away. This is seen when a fluid or acid Salt is joyned to a fixed or alkalizate; also when a fluid or fixed is put to a volatil or acrimonious. From this affection alone of the Salts does all the matter of all Solutions and Precipitations whatsoever depend. Wherefore seeing the Blood and Humours of our Body abound with very much Salt, which uses to be diversly changed from one state to ano-

ther, and thereupon to acquire a morbid disposition; and seeing moreover there are divers kinds of saline Diaphoreticks, namely such as are endued with a fixt, fluid, nitrous, volatil and alkalizate Salt; there will always be need of the great discretion and judgment of the Physician; that the saline Particles in the Medicine differ from those in our Body: In what manner this should be done, we will set forth by running through all the kinds of saline Diureticks.

1. Amongst the Diureticks imbued with an acid Salt, are the Spirits of Salt or Nitre; also the juice of Lemons and Sorrel, White Rhenish Wine and Cyder are of greatest note with the vulgar, and often perform that intention: For these alone fuse the Blood and precipitate it into serosities, as when an acid is poured into boiling Milk: But this happens not alike to all, nor equally to every one. In an healthful constitution the Salt of the Blood is partly fixed, and partly nitrous, and partly volatil: Also in some Scorbutical and Dropical it becomes commonly fixt: wherefore in all these cases Diureticks endued with an acid Salt are given with success. But in catarrhus Distempers and in some Dropical and Scorbutick, when the saline-fixed Particles of the Blood are promoted to a state of fluxion, and the volatil are depressed (as often happens) acetous Remedies use to do more hurt than good, inasmuch as they yet more pervert the Blood that is already degenerated from its right crasis: So that Medicines endued with a fixed or volatil Salt will be more profitable for these: As for example: Take of choise white Tartar, of Crystallum Minerale of each a Drachm and half, of Crabs Eyes a Drachm; make a Powder, the Dose whereof is from half a Drachm to two Scruples, in a fit vehicle, repeating it once in six or eight hours.

2. That Medicines endued with a fixed or lixivial Salt provoke Urine, appears plainly enough from the vulgar and empirical Remedy that is wont to be given for the cure of Dropies; namely it is usual in an *Anasarca*, and sometimes in an *Ascites*, when the Bowels or Flesh swell very much by a collection of Water, to give to drink a Lye made of the ashes of Wormwood, Broom or Bean-stalks infused in White-wine; whereupon it often happens that there follows a plentiful Pissing, and the Disease is cured. Yet I have observed that in some that Remedy has not proved Diuretick, and has rather increased than cured the Dropical disposition; the reason whereof if it be inquired, appears from what has been said above, That lixivial Salts do not fuse or precipitate either Milk or Blood, and therefore are not Diuretick in their proper Nature: nevertheless that effect sometimes follows, inasmuch as a fixed Salt being taken plentifully destroys the energie of an acid and coagulative Salt prevailing in the Blood; so that the Blood, being before too apt to be fused, and not able to retain its Serum, but throwing it off in every place, does by the advent of a fixed Salt recover its due crasis, and therefore reabsorbing the extravasated Serum and conveying it continually to the Kidneys, causes a plentiful Pissing. As for Example: Take of the Salt of Tartar or Wormwood two Drachms, of Coral calcin'd to whiteness a Drachm and half; of Nutmeg half a Drachm; make a Powder, of which the Dose is to two Scruples.

3. For the same reason as a fixed Salt, is sometimes also a volatil given with success for provoking Urine in an acetous dyscrasie of the Blood: namely inasmuch as its Particles being admitted into the Blood, destroy the prevalence of the fluid Salt therein; whereupon the Blood recovering its due mixture, and being freed from Coagulation and Catarrhs, reabsorbs all the Serum that is extravasated, and delivers what is superfluous, to the Reins, to be sent

B b b b b 2

off

off by the Ureters. To this class of Diureticks ought to be refer'd not only the pure and mixt volatil Salt drawn from Animals or Minerals by Distillation, but also the integral parts of Animals and Vegetables, (such as are the acrimonious Powders and Extracts of Insects and Vegetables.)

4. *Nitre* appears to be a certain kind of Salt, yet it is different from any other Salt, and is neither acid, nor fixt, nor volatil, but as it were in the mean betwixt both states. Thus far it partakes of a volatil Salt, that while it is made, when it should be lixiviated with the ashes and joined with the fixed Salt, it acquires a certain concretion: moreover when it is melted, it is presently set on a flame and flies away upon throwing any kind of Sulphur upon it. But in this respect it communicates with a fixed Salt, that being melted in a Crucible it endures a long and it may be a perpetual fusion without any notable loss of Parts or Particles. Indeed *Nitre* is that by which all Plants vegetate, all Animals live and breathe, and all sublunary flame or fire is kindled and fed. Now 'tis well enough known, that the Salt of *Nitre* cools the Blood, and powerfully provokes Urine, but the reason of both effects appears not so clearly; inasmuch as *Nitre* is so far from containing cooling Particles in it self, that on the contrary nothing is more igniparous or a greater breeder of fire. Nor is it less wonderful how this, whose nature is so fiery, should dilute the Blood so, and fuse it into aquosities for procuring Urine. As for my self, I think that *Nitre* contributes thereto, both as it is a Salt somewhat akin to both a fixed and volatil, and also as it is a thing combustible. As to the first, we observe that *Nitre* (like fixed and volatil Salts) being put in Milk, does hinder or remove the coagulation thereof; likewise that Blood as yet hot being poured upon this, is preserved from coagulation and discolouring no less than when it is poured upon those: So that the Particles of *Nitre* being taken inwardly keep the mixture of the Blood intire or restore it, inasmuch as they prevent or take away the fusions and coagulations of the same from which an *astus* (or heat) and *ischury* often spring. And moreover *Nitre*, as it is fiery, being taken inwardly cools the burning Blood and provokes urine, inasmuch as by its advent kindling more the flame of the Blood that before was turbid and mixed with *sinuok*, it makes it more clear and pure, and therefore more mild: and so seeing the Blood, while it is made by the *Nitre* to burn more clear, is loosened more in its *compages*, the serous Particles are easier disentangled and more plentifully depart from the thicker.

Willis.

5. 'Tis known that *Shell Powders* and some *Stones*, being endued with an Alkalizate or Petrefying Salt, do sometimes provoke Urine, seeing in great *ischuries* (or Stoppages of Urine) the Powder of Eggshells, of Crabs Claws or Eyes, hath been a present Remedy to some: The manner and reason of whose operation if it be inquired, it is very clear that these Medicines do not fuse, nor sensibly precipitate the Blood; and therefore we must say that these things are sometimes Diuretick in an acetous dyscrasie of the Blood and Humours, inasmuch as by their combination they tie and bridle the acid Salts, so that the Blood being freed from fluxions and coagulations, reforms the extravasated Serum and carries it to the Kidneys.

V. *Eur Seline* Medicines are not only reckoned for Diureticks, but justly also some *Sulphureous* and *spirituous*, because these often produce that effect. Most Medicines derived from the Pine or Larch-tree, especially Turpentine and its Preparations, the distilled Oils of Juniper, of Nutmeg, of Wax and other fat things taken inwardly, cause in most a plentiful Urine, and that endued with a violet-like smell. I have known in some hydropical and

scorbutick Persons, that the Spirit of Wine and Strong waters, yea generous Wine it self being drunk largely has promoted Pissing; the reason of all which is, that when the Blood being weak, or growing sower, does not, either through the defect of Fermentation or the dominion of an acid and coagulative Salt, circulate briskly enough and equably, and so keep the superfluous Serum so long within it self as till it may deliver it to the Kidneys, the foresaid Remedies, by keeping the mixture of the Blood intire, or restoring it when it falters, conduce to the provoking of Urine.

Idem.

VI. *Helmont* in his Treatise of the Stone (c. 5. Sect. 17.) thus distinguishes Diureticks as to their effects: 1. Some sharpen the Urine with a corrosive Poison, as *Cantharides*; 2. Others provoke an acidity, and leave it in the Urine and raise a Strangury, such as is new Beer or Ale; 3. Others make the Urine absterfive, as *acidule* or Mineral waters, *Vitriolum Martis*, Crabs eyes; and also the Herbs that every where are called Diuretick, and do all of them contain a volatil alkali, or at least acquire it in Digestion: 4. Some stimulate the sluggishness of the *Archeus*, and increase in it the expulsive Faculty, such as are Horse rhadish, *Asperagus*, &c. 5. Some refresh the Urine and Kidneys with a grateful smell, as Mace, Nutmeg, Turpentine, Mastich, Juniper, &c. as if the Kidneys being comforted by the Odour, became mindful of their office: 6. There are some also which from a lixivial alkali pass under digestion into an acrimony that cleanseth the passages of the Urine, like Soap, and stimulate the expulsive Faculty; and incide the filth that sticks to the passages; of which sort are those which are gathered from Shells and Stones, and the ashes of things appropriate, and which alone seem to deserve the name of Lithontripticks or Stone-breakers, especially if they be brought into a degree of volatility: 7. There is a kind of Diuretick which in a small quantity pours forth a great deal of Urine from the whole Body, as hog-lice, and what things soever contain a volatil *Nitre*, and which by their property excite the sluggish Kidneys: 8. There is also a kind which is profitable for allaying Pains in the Kidneys, comforting them when they hesitate; such a vertue there is in Saffron, Rhubarb and *Cassia*, when they are deprived of their loosening quality. I add those also which not only by an absterfive Faculty, but also by a resolute thrust forward, incide and expel the tartareous dross as well out of the Hypochondres as Kidneys: Thus Spirit of Sea-salt, and of Vitriol are not only Diuretick, but do moreover dissolve the Tartar and bring it out by the urinary Passages. Seeing therefore there is great diversity of them, they are not every of them alike fit to be admittit to every affection and morbid cause, but the nature of each is to be examined more accurately. Thus in the Dropic we fitly use those which are properly called Diureticks, which make the Urine absterfive, and incide the filth that sticks to the Passages, and by their acrimony excite the expulsive Faculty: but those are not to be used here which yield much watriness. Likewise Diureticks properly so called are good when there stick thick tartareous Humours in the Hypochondres and all the Veins; for these can attenuate, resolve, absterge and send them forth by Urine. The morbid cause also is to be well examin'd; for we must first lessen its plenty through other places of excretion, lest while it rushes into the narrow Veins it obstruct them. If there be acrimonious, salt and other sower Humours present in the Body, their acrimony is first to be mitigated or contemper'd, either by specifick digestives, or other appropriate Precipitants, lest they affect the rest of the Parts in their passage. If lastly the urinary Passages also and other adjacent Vessels be either exulcerated or inflamed, or labour under some such Distemper, the

the vitious Humours stagnating in the Body are not fitly moved by Diureticks to these affected and weak parts, unless the matter of the Ulcers be withdrawn both by Clysters and Catharticks. When the *viscera* are obstructed, unless the Diureticks be of that nature as to open, and absterge the Humours withal, they will procure a greater mischief to the Sick, and often do so prejudice the Bowels appointed for Concoction, that a Cachexie after a while ensues. See an example in *Horsius in Epist. Med. f. 8.*

VII. It is to be noted, that all *Diureticks* are not indifferently convenient in any distemper or Humour, for the benefitting of the sick by provoking Urine: but one is to be used in one Disease or offending Humour, and another in another. Some indeed are good for bringing out Choler, and others phlegm offending, by Urine: Proper for Choler are the juice of Citron, the emulsion of Barley, Straw-berries, the Spirit of Salt, the Salt of Tartar vitriolated, &c. and for Phlegm, amongst Chymical Medicines, the volatil Salt of Urine, and otherwise all volatil Salts, the distilled oils of Juniper-berries, of Amber, &c. yea and also the Acids commended just now for choler, because they no less alter Phlegm (yea Acids drive it forth by Urine) than do Aromatics and such as consist of a volatil Salt, as experience alone has taught us: yet the latter are for the most part observed to be the better, and fitter for restoring health, seeing they not only correct Phlegm, but also preserve the Choler in its natural state: But Acids though they incide Phlegm and promote its passing out by Urine, yet they do withal infringe Choler, and carry it from its natural state, and in that respect hurt.

VIII. *Diureticks* are most proper in those Diseases that are firmly rooted, and have their foundation in a *Tartareous, Saline Dregs*, in which it is profitable to evacuate by little and little the occasional cause of the Disease by the Urinary passages. Thus in the Hypochondriack and Scorbutick we empty out of the Body those Tartareous Humours, and preternatural Salts tinged with a Scorbutick ferment and springing from depraved digestions; I say we empty these out of the Body more fitly by degrees by Diuretick aperitives, otherwise called Antiscorbuticks, which withal saturate the force of the excited Salts, than by bare Sudorificks or Purgers only.

IX. By what means do *Diureticks* provoke Urine, and together with it drive forth the *pituitous* and *serous Humours*, seeing they differ very much one from another both in taste and smell, and other sensible qualities? That this may the more easily appear, we must know, that we here speak properly of those Diureticks that draw forth serous and Phlegmatick Humours abounding in the Body; wherefore the reason of that superfluity is first to be considered, which is seldom one alone, but most often manifold. For *Serum* or Phlegm abound in the mass of Blood, either because they are not separated from it, or because they are produced in so great plenty, that they cannot be sufficiently separated and discharged from it. If the *Serum* or Phlegm (*pituita*) be not separated from the mass of Blood, I think that happens not so much through the fault of the Kidneys as of the mass of Blood itself, yea all the fault that is sometimes observable in the Kidneys, is for the most part to be deduced from the same mass of Blood, seldom from their own primary fault, which then is to be deduced chiefly from external cold, or heat. Now the separation of the *Serum* and Phlegm from the Blood, fails for the most part through a more intimate conjunction and union of the parts of the Blood than was fitting, whence there uses to be separated and expelled not only less Urine, but less also of the contents that use to be separated and expelled together with the Urine, when they

abound in the Body and all things are well. And that more intimate union of the parts of the Blood through which neither the *Serum*, nor other things to be separated with it can be separated or expelled, happens; according to my hypotheses, through an acid, sometimes and more seldom through a more pure salt Eye in the Body, whence there is a more intimate conjunction and union of all the parts of the Blood.

X. Whether ought *Diureticks* precede the use of *Sudorificks*? We must know that sweat may sometimes be provoked without provoking Urine, especially when the Humours are only contained in the extreme Vessels: But it is far safer if Diureticks precede, first, Because the Physician does not certainly know whether the serous Humours are retained in the greater Vessels, or only in the extreme. Secondly, Because it is easier to provoke Urine than sweat, and we must always begin with the easier.

XI. We must note by the way, that as sweat does not always presently follow the use of *Sudorificks*; so there does not always presently follow an excretion of much Urine and such as is full of vitious Humours, upon the taking of Diureticks: The reason whereof is manifest; for when the vitious Humours are not apt or disposed for separation and consequently for expulsion, there ought to precede such a preparation of them as is requisite to it, that is, a kindly separation and secretion, upon the performance whereof there readily follows an expulsion of them: Now most Diureticks prepare for excretion, and separate the vitious Humours no less than expell them.

XII. *Diureticks* have a notable faculty to separate from the mass of Blood the vitious Humours that are more intimately mixed therewith, and to prepare them for some manner of excretion; wherefore amongst Diureticks those are always to be chosen which have moreover a faculty to correct the offending Humour. That I may now omit those Medicines which are vulgarly known, I here greatly commend the *sweet Spirit of Salt and Nitre* as the most agreeable for correcting Choler that is more Acrimonious and encreases the burning, as also for glutinous Phlegm, and is withal Diuretick.

XIII. Amongst the ways of evacuation *Diuresis* (or purging by Urine) is of the greatest profit; for by its use and help such Diseases are often cured, as neither Purgings nor Bleedings nor other evacuation could root out. And this is universal, and is reckoned among the *novali methodes* or common evacuations by * *Galen*; and though it purge primarily the gibbous or upper side of the Liver, the Kidneys, Bladder, and the Vessels that belong to these, and evacuate the watry and serous Humour; yet by a certain consequence it may purge the other parts of the Body also and all both Veins and Arteries. Nor does it only purge forth that part of the *Serum* which like a vehicle hath carried the aliment to the parts, and having done its office tendereth to the urinary passages and is by them expelled, but together with the *Serum* Tartareous Salt and other Acrimonious Humours: Hereby the *viscera* are freed from many impurities where-with they abound; superfluous Tartareous Humours being incided and attenuated are exhausted, the whole mass of Blood is restored to its integrity and the constitution of the Body is rendred firm and temperate: so that by this sort of evacuation, what is fitting being premised very many Diseases use to be cured.

XIV. The time of the Disease fittest for the *Diuresis* is either universal, or particular. They commonly say that the Humours are first to be prepared; and that it is not convenient in the beginning of the Disease, nor in the augment, when the matter being as yet crude would rather be agitated than evacuated; but in the declension, rarely

in the state. But this opinion being understood of Diureticks taken generally and indifferently, fails greatly: For there are Diureticks that are withal digestives, which by strengthening the ferments of the viscera do powerfully resolve the moribund excrements that they meet with in their way, do open obstructions, attenuate thick Humours, drink up acids, bridle the ebullition of the Blood, and by making the Urine absterfve expel the Tartareous Mucilage, such as are *D. Macbius's tinctura aperitiva*, *Spiritus Martis striat.* *Arcanum tartari soluti*, *Sal Martis aperitivum diureticum*, &c. These indeed may be given with great benefit, and may be born well by the Sick in any term of the Disease especially chronical, what is convenient being premised, and strengthening Cordials used between whiles: But such as are not of this sort, but do only plentifully eliquate the Urine, and have an attenuating faculty joyned with a watriness, especially the stronger hot ones, are not convenient till the matter be concocted or digested, and the impetus and fury of the moribund matter allayed: But the former may be good even when the matter is as yet crude, as *Galen* himself teaches, who before concoction gives a decoction of Smalledge and Dill, (*1 ad Glauco. c. 9.*) For they concoct the crude Humours, and make a separation of them from the mass of Blood, and expel them by Urine; they cause the moribund matter to follow Nature, and themselves emulate Nature. Whence also we see, that in Fevers as well continual as intermitting, after we have used them, the Urine that was crude becomes concocted, and the febrile heat and other Symptoms remit. Where yet we must note from *Galen* (*Meth. Med. c. ult.*) that if there be plentiful matter in the first ways, we may first use Looseners: in which case I also am of opinion that 'tis best to mix Diureticks and Looseners together.

Idem
ibid.

XV. Such Diureticks may be safely given to Infants, Children, Women that are with Child or are Lying in, as consist of an absterfve vertue from an alkali, and by their kindly acrimony incide and purge out the filth of the Urinary wayes, such as the stone of Perches, Crabs-Eyes, *lapis Judaicus*, *Nephriticus*, *Spongiz*, the Stones of Fruits and their ashes. Hot and dry Bodies are not long nor vehemently to be forced to Purge by Urine by hot Diuretick Decoctions, seeing from their use an Inflammation of the Liver, a Fever and an extenuation of the whole Body may follow. On the contrary, the fat, the cold, such as have a soft and loose Skin, and abound with a watry Humour and thin juices, are very fit to be purged by Urine.

Idem
ibid.

XVI. Those who use Diureticks in such as abound with crudities, for the most part hurt the Sick, because very often crudity does more in prohibiting than indicating: I say often, not alwayes, because whilst the Urine is detained in the upper parts and is altogether suppressed, although there be great crudity, yet nevertheless we have recourse to the most powerful Diureticks, such as *Cantharides*.

Sanctor. Met.
l. 15. c. 10.

XVII. We must never deal with Diureticks, especially such as are vehement, in passions of the Reins or Bladder that depend on much juice, before the whole Body be purged, and there be made the greatest revulsion by vomit that may be, and derivation to the intestines, and that is to be done by Medicines that are mild and are void of a malignant quality (not so far as that they have nothing of an attractive.) Because those which purge violently, do also provoke Urine and the Terms; and even upon this account cause Abortions, as justly seemed to *Averroes*. For if while the Body is full of bad juices a Diuretick be given, and that be weak or moderate, it will certainly cause the excrements to flow together towards the ways affected, and to be heaped and crammed up there, by which means they will be the less apt to go forth:

And if a violent one be given, so that it is able to break through this stoppage also, the same will also have the power to exulcerate, whereby it will exulcerate the Stomach and Intestines before it come at the place affected, and so will irritate both the upper and lower part of the Belly, and also by the pain that it causes will call excrements to the Belly; and it will come to pass, that what was given as a Diuretick, will by accident act the part of a Vomit or Purge, but with great mischief to the Patient, seeing it does not Purge by an attractive faculty, but corrupts by an exulceratory.

Vallef. l. 5.
Epid. p. 480.

XVIII. After the tryal of Medicines of all sorts for 29 years, I have hardly observed, that Diureticks, which quickly pass through by Urine, do evacuate excrements more than usual: And let the Readers know, that there are no Medicines which so purge by Urine, as there are that purge by stool. Because that is said to be Diuretick which moves by Urine, I see not why a Diuretick should carry with it such things as ought to be Purged: For Mineral Waters are called Diuretick, because they themselves pass; nay there are rarely found Diureticks which are altogether and wholly evacuated by Urine: For if any one drink ten pints of Mineral Waters, and there pass out by Urine, nine or ten pints, such will be esteemed very good Diureticks: but we say not so of purging Physick, because half a scruple of *diagridium* will evacuate an Hundred scruples and more of excrements. The same we say of other things, for the smell of *Asperagus* passes by Urine, but it carries little or nothing with it of other excrements; yea the Spanish Fly that provokes Urine the most strongly, causes heat by driving forth only a few drops of Urine, and not any great quantity of it or other excrements. It would be indeed a great happiness if such Diureticks were to be had in the Shops, as would evacuate by Urine not only themselves, but more or other excrements contained in the Veins, because they would expediently overcome all those evils that are contained in the Veins.

XIX. The continued use of Diureticks, as if they be taken Morning, Noon and Night, doth encrease their vertue and efficacy.

Joh. Walzrus
m. m. p. 71.

XX. Diureticks ought not to be mixed with meats. I do not indeed reject Pottage of Roots, Herbs and other aperitives, but yet they must not be sapt at Dinner, but an hour or two before: for if they be mixed with other meats, it is to be feared they will hurry the undigested chyle along with themselves. How great their vertue is, *Pigraus* (*lib. 10. cap. 20.*) speaking of the Spaw-Waters shews, viz. that they hurry along with them whatsoever they meet with, even Anniseed commits themselves whole. A Citizen of *Friburg* being taken with a stoppage of Urine, and suffering great pains for some dayes, and having taken many things in vain, at length, having first purged, took Crabfish stamped with Winter Cherries, whereby Urine was so provoked, that the stones of the Winter-Cherries were expelled with this Urine, and that not without the greatest pain and torment.

Fab. Hilda-
nus Cent. 3.
obl. 72.

XXI. We must note concerning the cold Seeds, that their Diuretick vertue resides most in their husks, for the pulp doth moisten and nourish.

Heurn. Meth.
ad prax. l. 1.
p. m. 110.

XXII. We must learn from *Galen* that when our intention is to provoke Urine, the Remedies are to be taken with Sugar or Honey: Therefore *Aclepiades* saith, that a Remedy of Cichory or Endive (prescribed on account of the Liver) provokes Urine because it is made up with Honey: The same we may think of Sugar.

Saxon. prax.
lect. pract.
part. 2. cap.
23.

XXIII. I will open the safest way to use *Cantharides* by infusion: Let a scruple of *Cantharides* being powdered be infused in three or four ounces of Rhenish Wine or Brandy, and let it stand in Infusion for some dayes, then filtre it through brown Paper that nothing of the substance of the *Cantharides*

des

des be mixed with the Liquor: Mix one spoonful of the strained Liquor in seven of Wine or Beer; and of this mixture give to drink the first day one Spoonful, the second two, and so on. In a virulent Gonorrhoea, suppression of Urine and the Stone, Mr. Dr. Jac. Franc. Kotzoe found a good success of this prepared Potion. Chymists write truly, that Salt is the chief Diuretick, hence *Cantharides* most powerfully provoke Urine, for they are endued with an acrimonious volatil caustick Salt that is meltable in the Urine, which being received into the Vessels does therefore so stimulate in the Reins and Bladder, as both to erode, and cause a Bloody Urine.

XXIV. Volatil Salts being taken for continuance, even together with meat, bring Phlegm down to the Kidneys, and carry it out with the Urine; inasmuch as they not only incide and correct glutinous Phlegm, but drive forward part thereof to the wayes of Urine, and expel it in the form of sediment, which yet falls in the Urine by little and little, and in that very respect yields an undoubted sign that the greatest part of the Phlegm is corrected and overcome: Which I would have to be taken notice of here for the sake of the Juniors, because there are some Seniors, who being less versed in the preparation of the more powerful volatil Salts, and therefore also less accustomed to observe their virtues, do make slight of them not without some suspicion of envy: Thus many find fault with those things they do not understand, nor will be at the pains to learn.

XXV. Let Tartar with its off-spring carry the Bell amongst Diureticks, and let it be of the choicer sort, and as if it had been crystallized of it self: what hinders why it should not be given washed only, (as we have long and securely used to do even with the shining red) without any depuration (invented by some Mens too great officiousness) which manifestly carries away the most subtil part (as the remaining water that serves for the solution of many things teaches) but not wholly the arenosities: or if any fear some feculency (which yet is very full of volatil Salt) let him depurate it only once and that warily, (as it commonly comes under the name of *Acidum Tartari*) without the vain affectations or separate repositions of the white, cream or crystals (that are indeed indifferent.)

XXVI. The Roots of crude *Asarum*, though they cause Vomit with great anxiety; yet being boiled in water and not in Wine, they are changed into a deopillative Diuretick and a Remedy for slow Fevers, which shews that there is an aroma hid therein: To this as to the only Remedy, did *D. Obeimius* fly in long continued Fevers that depended on inveterate obstructions of the Hypochondres.

XXVII. Now amongst Diureticks I observe that two sorts are recommended by Authors, some more gentle that bring no force upon the Body; and others more violent, which finding no noxious Humours in the Body to act or put forth their vertue upon, or that may also blunt them, do bring harm to the Body, yea expel pure Blood (and sometimes the Soul with it) together with the Urine; and therefore these are dangerous and suspected by me, and I think we should neither use them rashly nor often. Amongst these are first the *Scorpion*, the ashes whereof, being burnt, are given in Wine, even according to the Ancients, to provoke Urine. Secondly, *Hog-lice*, whose juice they give pressed out with Wine. Thirdly, *Cantharides*, whose use is frequent enough in a virulent Gonorrhoea (See their preparation § 23.) Fourthly, May worms that are black, very stinking and powerfully provoke Urine in the Feet-gout.

XXVIII. But we must note that these latter Diureticks are not so proper for bringing out by Urine Humours abiding in the Blood or elsewhere, as for expelling the Urine already separa-

ted: so that the gentle Diureticks are more universal and to be used in all cases; these latter more particular and more proper in some certain Distempers: These latter, inasmuch as they sometimes drive forth pure Blood instead of Humours from the Blood, or offend otherwise, are deservedly reputed dangerous Medicines, and therefore not to be used but with great, continual and prudent caution: yet they may be sometimes (but prudently) used where the more gentle have been given in vain, and where a great malady urgeth; always attending to the effect, which as long as 'tis good, their use may be persisted in, but as soon as the least hurt is observed, we must cease from their further use.

Emmenagogues, or provokers of the Terms.

(See *Mensium suppressio* Book XII.)

The Contents.

They either respect the wayes. I.
Or the coagulated Blood it self. II.
Or they promote its rarefaction. III.
Or they stimulate and do both. IV.
Or they restore the Blood it self. V.
They are not to be given to Women with Child. VI.
They are not to be given to all indifferently. VII.
The order to be observed in the use of Remedies. VIII.

I. Medicines provoking the Terms respect either the wayes, which namely ought to be free in all the microcosmick Common-wealth, such as are both all Aperients, except the acid and nitrous, which namely are contrary to the other intention, unless the same be so directed that under the dominion of others they may assist the action of the same: Baths also do greatly help here, which both by their gentle heat and their notable vertue to moisten, do very well open the passages: Likewise suffumigations that loosen the Pores and draw away mucus, belong hither; as for example, *Timaeus* in his Counsels commends the suffumigation of *Coloquintida* received into the Womb by a Funnel, which Remedy takes place after Bathing. And therefore by experience your *Emmenagoga* denote nothing else but specifick uterine Aperients.

II. Or they respect the Blood it self, the state whereof as the Terms do in a special manner shew, so do they altogether follow the condition thereof. Now those are notable *Emmenagogues* which promote the motion of the Blood; which in specie they do two manner of wayes, either first they take away the impediments that fix as it were and coagulate the Blood, which are two, acid Humours and Phlegmatick, or coagulated Serum: amongst these are Martial Medicines (for instance) *Crocus aperitivus Sulphuratus*, with Salts, *Quercetan's* Cachectick powder, his Stomachick powder: yea some give the infusion of the crude filings of Steel or Gold with the same intention, that they may absorb and repress the constringing acidity: but those Steel-Remedies are best that have withal a faculty to moisten, as the tincture of Steel pomated or cydoniated, which are excellent; the tartareous tincture of Steel, and the like, that at the same time both the driness may be respected, and the deficient fermentation of the Blood promoted, and others that liquate, fuse, resolve and attenuate the coagulating Serum or Phlegm, such as are bitter things and others of thin parts.

m. m. l. 1.
cap. 12.

Sylv. de le
Boe m. m.
l. 2. c. 12.

III. Or *Secondly* they promote its rarefaction, and singulare, that upon the excitation and exaltation of its Sulphureous and volatil Saline particles, it may become the more active, and losing its sluggish lentor or clamminess may take up more room in quality and motion; to which belong all Balsamicks, volatil and mean, as well Sulphureous, for instance, Saffron, Myrrh, Bay-berries, Savin; likewise the distilled oyls of Savin, Cinnamon, Balm, Saffron, &c. as Saline, fixed and volatil Salts, the tincture of Tartar, Borax, salt of Mugwort, of Salt and Vitriol, &c. the Spirit of Sal Armoniack, Harts-horn, the volatil Salt of Amber. Hence is this practick rule appropriated to both intentions, *Those things that provoke urine, do for the most part also provoke the Terms.*

IV. Or they both stimulate and rarefie: and hither belong even Purgers themselves, inasmuch as they do not only attenuate and bring out the antecedent cause, viz. viscid and clammy Humours, and so open and respect the ways; but also help the rarefaction and fermentation of the Blood, so that the flux returns on the very day whereon the Purge is taken. And amongst other things Aloes also helps here, whence *Frid. Hofman* relates that he had a Maid, whose Terms could be no other ways promoted, but by the use of *pil. Ruffi*.

V. Or they restore, and recruit the Blood it self, and so make it fluxile, whither belong Restoratives and a full Diet; for it would be absurd, if it fail in quantity, to promote its motion. Hence as women have a more serous and fluxile Blood, namely such as is apter for turgescency, and on this very account acquire a serous Plethora; so we must also wholly provide for this.

VI. Emmenagogues are not to be given to women with Child, whence they are always warily to be prescribed to those we suspect for whores, when they complain of an obstruction of their Terms: for though, unless when there is a disposition to abortion, they often drink the decoction of Savin, &c. in vain, yet in a doubtful case we must not ascend above Steel-Remedies and moderate Aperients. Neither are too hot Medicines to be given to Women with Child, such as heighten the rarefaction of the Blood: for as Women with Child through such preternatural rarefaction and fermentation, or being seized upon by burning Fevers, use for the most part to have their Terms preternaturally, and consequently to suffer abortion; so we must much less intend that by Medicines, which also is the very reason why Purgers are not so convenient.

VII. Aperients alone, or provokers alone are not to be used indifferently: Physicians often err egregiously who give Term-provoking decoctions, yea the distilled oyls of Juniper or Savin, the Spirit of Sal Armoniack and the like all day long and indifferently, thinking these to be Specificks, whereas those are chiefly to be esteemed for such which satisfy this or that more special intention.

VIII. 'Tis therefore the best to begin with Aperients, and to subjoin Provokers or drivers, both internal and external: Hence for a week or two before the accustomed time, are wont to be given Aperients, moisteners, digestives, preparers; yea Purgers themselves and Blood letting, upon which the hinge of the matter turns, are not to be made use of at another time; for if they be, the whole curation will be to no purpose and ineffectual.

G. W. Wedel, de C. M. fac. p. 185.

Frictions.

The Contents.

Whether they be convenient when a crude juice abounds. I.

They are suspected in hot and cold Diseases. II.

Whether they evacuate all the Body. III.

Scratching supplies the place of Friction. IV.

I. Friction or chafing may seem to some to be inconvenient for those in whom is heaped up a plenty of crude juices, because * *Galen* writes, that those who have but little good Blood, and abundance of crude Humour, must neither be bled, nor purged, nor must they use exercise or bathing; and therefore neither friction, seeing it also moves the Humours: and because he forbids bathing, which hath the same virtues as friction, seeing both draw towards the Skin. *Galen* also in * another place, in the cure of Fevers that arise from obstruction, forbids to cleanse the Skin before the evacuation of the whole Body, lest a crude abster-sion draw to the Skin, whence there will be a greater obstruction of the pores; which same thing will happen upon friction. But *Galen* is indeed of a contrary opinion: for (*in lib. de f. m. c. 6.*) he says thus of this affection, that those who are so affected are not to be evacuated by Bleeding, but by frictions and indifferently heating unctions, &c. And 12. meth. c. 3. he cures those who fall into a swooning through the abundance of crude Humours, by much and strong friction of the whole Body: yet he denies bathing to the same persons, which though it have the like virtue as friction, yet differs there from in that it rather melts the Humours, than incides and attenuates them; whereas friction does the contrary. Hence it comes to pass that bathing causes fluxions, those Humours flowing which are melted; I say it causes a distribution of crude Humours, which friction does not do, as attenuating more than melting: wherefore where there is need of moistening, *Galen* uses bathing rather; and where of opening obstructions, friction rather. But friction also draws towards the Skin, wherefore it will also encrease obstructions. I said, that friction as it draws, does likewise attenuate: and seeing it draws less than bathing and extenuates more, it is the far more profitable of the two in this affection: and besides what is already said, if by chance it should cause something of obstruction by extracting the crude Humours, that might be amended by anointing with some oyl that is moderately heating and con-cocting: so that friction and unction ought to be used by turns, but not bathing at all; as also neither Exercise, because it causes a distribution of crude Humours from the inmost parts. In Fevers that spring from obstruction, we abstain from cleansers of the Skin till we have evacuated the whole, because in that case the obstruction of the Skin is a great part of the malady, and such as ought to be removed before the Fever it self, and in the mean time we may use great evacuations: but in this affection we speak of, the evil is least at the Skin, for it has its seat principally in the viscera. Swooning hinders great evacuations to be used; and therefore we are glad to fly to frictions.

II. Frictions, in hot and acute Diseases, such as the Pleurisie, have always been suspected by me; for 'tis certain that the Blood and Humours wax hot thereby, are rendered more Acrimonious and therefore rush with the greater violence to the part

Vallef. l. 1. c. 7. contr. c. 7.

part affected. In cold Diseases, as Apoplexy, Epilepsie, Palsie and the like, they may seem to have place; but because thereby the Blood and Humours wax hot, and like a vehicle carry the crude and cold Humours to the part affected, we must use them warily, especially in the beginning of the Disease, and while the matter is yet in fluxion.

Fabr. Hild.
Cent. 5.
Obs. 30.

III. *Galen* (4. *aph.* 2.) teaches plainly, that by much friction the whole Body is not diminished nor evacuated: Yet it is most true that as to the external parts and such as are next to the Skin, the whole is exhausted, as far as the virtue of the friction can reach, as the same person hath explain'd himself 14. *meth.* c. 7. and *Hippocrates* himself (6. *Epid.*) where he hath written, that friction, in a great compass, doth heat and dry the Body, and thereby empty the Spirits. And indeed seeing the Veins and Arteries are heated by it, and thereupon an heat is both excited and called out by little and little, we must hold that the whole Body is evacuated, at least by accident. Therefore when *Galen* denies that the whole Body is diminished by friction, he means, not in that manner as Purgers evacuate, in comparison whereof he there speaks.

Rub. in cap.
14. l. 2. Celsi.

IV. Scratching is profitable for many Diseases, for it calls out to the Skin from the viscera and diffuses thence: in short, it is as beneficial as hard friction.

Valles. in
Epid. p. 686.

Glands, or Suppositories.

The Contents.

Their too great length is unprofitable. I.
They empty not from the Guts only. II.

I. IT is to be noted that it is unprofitable to make Suppositories so long as they are commonly made, seeing they irritate not the expulsive faculty save only in that part where they touch the *podex* or extremity of the Arse-gut: therefore 'tis better to shape them shorter, and about as thick as ones Finger.

Mercat. ex
Rondeler.

II. If Suppositories be made of the stronger Medicines, they may evacuate even out of the Mesaraick Veins, yea out of the whole Body: for experience witnesseth this, by which it is manifest, that Suppositories made of Hellebore have had the same operation as if it had been taken inwardly by the Mouth.

Grumos solventia, or dissolvers of congealed Blood.

The Contents.

They respect either the hindered circulation of the Blood. I.
Or the coagulated Blood it self. Acids dissolve concretion. II.

I. Dissolvers of clods of Blood are of a middle nature as it were betwixt Diaphoreticks and Diureticks: for here we apply *H. Saxonia's* Rule who * says, Those things which mollifie the stone, the same attenuate clods of Blood. For as the very grumefaction supposes 1. Blood extravasated, that is, slid for a certain time and space out of the Vessels,

Prælect.
pract. part.
l. 2. p. 38. § 3.

(its circulation being hindered) whether that be *in fieri* or *in facto*, (that is, whether the Blood be but now a sliding, or be already slid) 2. Blood ready to coagulate, inasmuch as without its proper element and sphere it putrefies, corrupts and remains unmoved: so those things which loose and fuse it when concretion, so that it may either be received again into the Veins, or if it be no longer capable of returning to its former state and nature, it may be dissipated and evacuated, I say those very Medicines do perform their operation two manner of wayes chiefly: for they respect either 1. the hindered motion and circulation of the Blood, whether it rush of its own accord into some certain and definite weaker part, as in Inflammations; or by the breaking of the Vessels and some outward hurt it be thrown out of the Vessels and be collected somewhere: And of this sort are all Diaphoreticks in a special manner, as well volatils, that enjoy a thinness of parts, which make the Blood more fluxile, and cause it to return into order by quickening its motion and making it more subtil and rare; as Balsamicks, Myrrhe, Zedoary; and likewise fixts, as antimon. diaphoretic. hence the tincture of Bezoar, the Spirit of Harts-horn, *mistura simplex*, antimon. diaphoret. Zedoary, opium, &c. are excellent in this case; and bring present help. And these profit likewise in the former case in all kinds of Inflammations, of the Pleura, Liver, &c. new wounds, in new falls from on high, imposthumes that are a breeding, &c. in regard by this means the coagulation and concretion it self is hindered, and is destroyed in the blade as it were; for as soon as the circulation is reduced into order, a collection is no longer to be feared.

II. Or 2. the coagulum (or coagulated Blood) it self being now of a greater consistence, and finished as it were; whither belong divers resolvers ranked under Nephriticks, whether Sulphureous, as *sperma ceti*, which is a notable solvent, & in this respect is excellent in an Asthma, or Saline, & of these, both 1. Acids, such as are simple Vinegar and Vinegar of Squills, oxymel scillit. the juice of Lemons, Spirit of Vitriol; And so our Thesis stands unmoved, Acids resolve coagulated Blood; whence it may peculiarly be here noted (to discuss these things more thoroughly) that Acids are not so proper in the first degree, to wit while the Blood is extravasating or rushing somewhat with a Rheumatism, unless by a secondary intention, and under the Dominion of Volatils, for then they more promote the coagulation, which they commonly call repelling; as in the second, where the extravasation or coagulation is already made: and also 2. Alkali's and Alkalines, as Crabs-eyes and other Diureticks and Lithonripticks, and those Herbs which for this very Alkali are called Traumaticks or Wound-herbs, and their juice, decoction, essence, &c. Whence the reason is clear why in the Pleurisie, according to *Helmont* himself, the same are accounted specificks which are otherwise good for coagulated Blood, namely that the matter may be so far resolved as that it may be expectorated: These things are good in falls from on high, whence *pulvis ad casum Augustan.* is famous: So also Goats Blood, to say nothing of Crabs-eyes, is an Antipleuritic, dissolving clotted Blood and the stone, chiefly through the volatil Salt that it is furnished with.

Barbette
 Chirurg. part
 1. cap. 17.

Heurnius
 tract. de hi-
 rud.

Idem.

I. **O**ne being troubled with the Pain of the Hemorrhoids by Intervals, and having them always cease at the expulsion of the black Blood, through defect of this evacuation fell into a melancholy. When no Remedies could provoke the retarded evacuation, and Leeches had been thrice applied in vain, as sucking only from the external Veins, I coming advise to set them on again; but first to set on a Cupping glass that might comprehend the whole anus. This invention was of that moment, that the orifices of the Veins that lay hid within, strutting out, there followed a large flux of Blood, whereby the offending Humour being evacuated the Patient was recovered.

II. The Hemorrhoidal Veins in Children and Yonths, as being slender and not yet widen'd with melancholick Blood, if they be open'd, are wont to send forth but little thick Blood.

III. 'Tis worthy observation that Leeches draw more Blood from the Arteries than the Veins, and therefore they ought to draw forth the less.

IV. Some cleanse Leeches newly caught from their filth with a Sponge or course cloth, and throw them into very pure water; which they change often, and for nourishment put in a little Sugar: But I have learned by Experience, that if they be squeezed a little presently after they are caught and be cleansed from their *sordes* or filth in warm water with a Sponge, they have been wholly hurtless without any more ado, and have caused no other Symptoms: supposing that they be taken out of pure waters, and be not virulent.

V. Some put them in a hollow Cane or Reed, or a long Glass, so that the head only may stand out, and so set them on; but because this way is more troublesome, and often succeeds not well because of their slipperiness, and the sometimes thicker, sometimes slenderer extension of their Bodies, it is better and easier to hold them in a cloth, and set them on with your hand.

VI. Note, that 'tis not always necessary to cut off their tails, because when they are applied to any larger and more eminent Vein, as to the Hemorrhoidal, Jugular, or to the larger vessels of the

Arms and Legs, they may so open them by their bite and attract the Blood, that after their fall off, when they are filled, the Blood may continue to issue out so plentifully, that there may be sometimes need to stop it with Plasters.

VII. After they have sucked Blood enough, unless they fall off of their own accord, sprinkle ashes or salt on their head, which having tasted they will presently fall off: But they are not to be snatcht off by force, lest they leave their heads (that are affix'd) behind them, which may be the cause of incurable Wounds: which thing, as *Pliny* relates, happen'd to *Mesalinus*, a Roman Senator.

VIII. *Avicen* and others would have a Cupping-glass set upon the bitten place, and a little Blood drawn therefrom, that the malignity of the bite may be corrected: But because our Leeches seem to have no such malignity, there is no need of such setting on of Cupping-glasses: In the mean time he that for the greater security will wash the bitten place with salt water or vinegar, let him. I can testify I have several times applied them, and after their falling off have perceived no mischief or virulence, only an itching which went off in a little time.

IX. If they be to be applied to the Hemorrhoidal Veins, first let the Fundament be fomented with a decoction of Mallows, Chamomel and other Emollients; and then let the place of the Hemorrhoidal Veins be chafed, because by that means the orifices of the Veins will appear, to every of which let a several Leech be applied. (How to make the Veins appear, see §. 1.)

If the Blood sucked by the Leeches appear sometimes subtil and ruddy, as I have often seen it, I think this happens through the error of him that applies them, who set them not upon the mouths of the Veins, but upon the edge of the anus. 'Tis necessary to turn the anus a little inside out, and by Cupping-glasses to draw the Hemorrhoids outwards that you may see them, which is not known to all that apply them. Now I know they have been rightly applied when the Leech being cut with a pair of Scissors pours forth much thick black Blood; but if it be ruddy and thin, I know that he that set them on has mistaken: But if after the thick is drawn out, the thin follow, 'tis well enough.

X. The Greeks, *Galen* and *Oribasius* say that Leeches suck only the Blood contained in and next under the Skin: *Avicen* and the Arabians say they draw it deep out of the Body; & determine that the extraction of Blood that is made by them is deeper than the extraction that is made by Cupping glasses. But these Authors may easily be reconciled to one another, if the place to which the Leeches are applied, be distinguished: For if they be applied to the larger vessels in the Arm, Forehead, Legs, or to the strutting Hemorrhoids, we see that the Blood is sometimes so largely evacuated, that Causticks and Emplasticks are necessary to stop it, and there sometimes follows a Cachexie and Dropsie: Now it is certain that so much Blood must needs flow from the whole Body. But the matter is otherwise if they be applied where the Veins are not so wide, but slenderer and lying just under the Skin.

XI. Some think they attract only the cutaneous Blood, leaving the thicker, (as *Mercurialis*) because the Wound that is made is so small that the thinner part only can pass out. But from *Zacutus* (*Lib. 1. Hist. Princ. 4.*) it appears he was greatly deceived; for besides that the Ancients used to set Leeches on the Part affected, in Diseases springing from a thick Humour, the hole made by them (especially by the larger) is so large, that the thickest *Sordes* may flow out by it, and there often happens a plentiful Bleeding, to stop which there is sometimes need of astringent Remedies.

XII. A

XII. A man desiring Leeches to be applied to his *anus*, one slipping out of the Surgeon's Fingers entred a good way in at the Fundament: I commanded to be applied to the *anus* dry Ox-dung, indifferently hot, sprinkling first the Powder of Wall-lace upon it (as also very good Castor) by the fume whereof, and by a Clyster made of the juice of Onion alone, the Leech was voided with the Excrements half dead.

Zacut. l. 1.
Obf. 7. Hist.
Princ. Med.

XIII. Whether are Leeches to be applied to the Hemorrhoids, and Nature to be accustomed to discharge her self by this way? *Sennertus* (*Lib. 3. Pract. Part. 2. Sect. 2. c. 12.*) handles this question elegantly, and cites chiefly *Vidor Trincavellius*, who (*Pract. l. 9. c. 14.*) dissuades from this operation, because none of the Greeks or Arabians have mention'd it; and because *Galen* (*4. Aph. 25.*) does plainly advise, not to accustom our selves to an evacuation by the Hemorrhoids, because it is not without danger: if black Humours flow, the evacuation may indeed be profitable; but if thin and clear Blood, or in a greater quantity be expelled, it is unprofitable: As *Trincavellius* writes that he has observed, that the Blood drawn by Leeches out of the Veins of the *anus*, is commonly bright not black, especially when those Veins do not swell of their own accord, or first are painful. But *Aquapendent* resolves the contrary, affirming that in those who have never had any Flux of Blood by the Veins of the *anus*, nor had them swelled, yet an evacuation by setting on Leeches ought to be tryed, namely in the Melancholy, Pleurisie, Head-ach, Fevers, distempered Spleen, faults of the Kidneys and many others. *Aquapendent* confirms his Opinion, 1. By the Authority of *Galen* (*4. Aph. 25.*) who writes that Blood expelled above, what such soever it be, is bad; but below and by the Hemorrhoids, good, when Nature has heaped up much such Blood; namely if the evacuation be moderate and be born well: 2. By Experience, which shews that Nature does often thereby free the Body from many Diseases, and that she ought to be imitated: 3. Those Vessels are naturally framed for this use, that what hurtful thing abounds in the Body, may be evacuated by them: 4. That an evacuation made by Nature or the Physician, as often as hurtful matter is present, is good and not to be disallowed: 5. That if one might not take away melancholick Blood by the Hemorrhoids, then neither should a Vein be opened: 6. That Nature is the curer of Diseases, and so to be imitated, and we often see her to open these for evacuating superfluities, and therefore that 'tis very fitting to attempt the same by Art.

Hernius.

XIV. In the mean time it is much to be heeded, which Hemorrhoids are to be opened by Leeches? and what Humours offend or where? For if the Humours offend in the *Vena cava*, it is more fit to open the external Hemorrhoids, though they used not to bleed before, if so be they swell: Yet the same may also be opened, if they swell, or used to bleed, although the vicious Humours lurk in the branches of *Vena portæ*, viz. because of the consent and inoculation of the internal and external Hemorrhoids; though then, if it can be conveniently done, it is more profitable to open the internal, whether they swell or not, for the reasons produced by *Aquapendent*: But let not the external be opened unless they swell, seeing Nature endeavours not to expel any thing this way. ¶ But has the distinction of the internal and external Hemorrhoids a foundation? Yea verily: If you would take away thick Blood from the hemorrhoidal Veins, so that the *Vena Portæ* may be unloaded, apply the Leeches towards the Rump-Bone, and more towards the inside of the Arse-gut: if you think upon emptying the *Vena cava* only, you shall draw Blood from the sides of the *anus* and towards the *Perineum*, and superficially.

Riolan. An-
thopogr.

XV. Yet in the mean time the difference of Natures and Countreys is to be consider'd here, as *Aquapendent* admonishes: For the opening of the Hemorrhoids is celebrated in Italy and the Southern Parts with greater benefit, because the Inhabitants thereof have a more hot and adust Blood; and therefore they are more subject to the flux of the Hemorrhoids than Northern People, whose Blood is colder and the Hemorrhoids less familiar: Though experience proveth that here the blind and swelling are frequent enough, especially in them that are subject to hypochondriacal affections and the Scurvy, which therefore it is necessary to open for the evacuation of the feculent and melancholick Blood that falls down toward the lower Parts.

Idem.

XVI. It is to be observed that the Womb has great consent with the hemorrhoidal Veins; because upon the retention of the Terms and Childbed Purgations these Vessels swell very much: Yet that they are not necessarily to be opened in affections of the Womb, appears, because the Blood redundant in this part may be discharged by proper Vessels, and that far more safely; for although those Veins may be easily opened, yet they are hard to be clos'd again: And if the Childbed Purgations succeed not, they may be evacuated by proper uterine Purgers.

XVII. *Zacutus* (*l. 3. Pract. Admir. Obf. 39.*) diligently admonishes us that the blind Hemorrhoids, the painful, the swelling and inflamed are in no wise to be scarified, lest incurable and fistulous Ulcers follow: Neither are they to be opened by Phlebotomy, lest there follow an irreparable flux of Blood, carrying a man off quickly: Bringing the Example of a melancholick young man, and of *Dod John of Austria* Son to *Charles V. Emperor*; both of whom having their Hemorrhoids opened with a Lancet, and a large flux of Blood following, died within a few hours: And commending Leeches as safer. Yet some famous Physicians are not afraid of opening them by a Lancet, amongst whom are *Massarius*, *Sylvius*, *P. Argellata*, *Matthæus Martini*: Yet the Lancet, as also the incision made by it must be very small, lest there happen a larger evacuation of Blood than is agreeable to Nature or can easily be stanch'd. *Severinus* prefers the hooky prickle of the Fuller's thistle, to which a piece of a leaden bullet is fitted, that it may be thrust in the more steadily.

Hernius.

XVIII. That we may not always open them in Diseases of the Spleen, will thus appear: In Diseases of the Spleen, we draw the Humours either out of the bowel itself, or out of the neighbouring Vessels: If out of the bowel, then the opening of these Vessels is in vain, for they have valves that hinder the flowing out of the Blood of the Spleen: whatsoever Blood is drawn out by these, it all comes from the *Cœliack Artery*, and nothing from the Spleen: But if we have a mind to empty from the neighbourhood, in like manner the opening of these Vessels does not always profit, for there are three sorts of Melancholicks; The first abound with that thick and sad juice all their Body over; The second have lost their appetite, and the last have it: In the two former because all the *ramus splenicus* and *Cœliack Artery* are obstructed, no benefit is had therefrom; but the last do often find much relief, for when these Vessels are opened, the *Cœliack Artery* may discharge by them its abounding Blood, and so the Spleen may be lighten'd. *Waleus m. m. p. 86.* Who thence infers, that in these last Melancholicks they may indeed be open'd, but without all necessity, for one Vomit, he says, can do more than ten times opening of these: But seeing Nature does often of her own accord unlock the Hemorrhoids with advantage to Health, why may not Art also in imitation try the same thing? for Nature by opening these, uses to deposite by them the scum of the Blood, as if a Purge had been taken, which returning by intervals preserves not only from melancholick

lancholick Diseases, but others also the most dangerous. It cures an hardened Spleen, 6. Epid. 6. 8. dissolves Melancholy, 6. Aph. 11. 21, 22. and all abundance of Humours is purged out by its vertue.

XIX. In continual and malignant Fevers, *Aquapendent* says, an evacuation by the Hemorrhoids does more good than bleeding in the Arm, because the larger branches of the *Cava*, in which the offending matter sticks, may thus be emptied: I add, that whilst they draw from the Hemorrhoidal Arteries, 'tis very like that the Heart will be wonderfully helped thereby.

Hepaticks, or Medicines for the Liver.

(See *Hepatis affectus*, or Diseases of the Liver.)

The Contents.

They respect either its Vessels, Ducts and Pores; I.
Or the Choler; (which is either to be restored; II.
Or temper'd: III.)
Or its tone. IV.
What and how sweet things help. V.
How Steel-Remedies profit. VI.
The too much use of Aperients is hurtful. VII.
Astringents have not place always. VIII.
The abuse of Syrups hurteth. IX.

I. **H**epatick Remedies respect either its vessels, Ducts and Pores, in the concrete, respect being likewise had to the Lymphatick Vessels and Gall-Bladder; or the Choler, which it separates and transcolates; or its tone, fibres and parietes or Parenchyma. Aperients do chiefly respect the Ducts, for this Bowel is principally and above all others subject to Obstructions, because of the very numerous Vessels that it has, so that the chief Hepaticks are Aperients. Hither belong also Diureticks, which, unless there be withal an over dry intemperies, or if there be, such of them as are more dilute, are most agreeable to the Liver. Thus to repeat only a few, 1. Bitter things are profitable that cleanse, cut and attenuate the clamminess of the choler: 2. Others of thin Parts, whether Aromaticks, as *calamus Aromaticus*, Spicknard, &c. or Acids, as red Liverwort, Mineral Spirits: 3. Absorbents, Lixivials and especially Steel Remedies: And these have a notable use in Obstructions, in a too mucilaginous choler, Jaundise, Dropsie, Cachexie, and the like.

II. Moreover those that respect the Choler, do either restore it, if it be sluggish and defective; or bridle it when it exceeds and is impetuous, lessen it when it abounds, and mitigate it when it boils and burns as it were. Those that restore the Choler are, 1. Partly contrary to those that restore the Ferment of the Stomach, and are for the most part the same which encrease the heat of the Stomach, namely Sulphureous Balsamicks, as all Aromata or Spices, likewise spirituous as Wine and its Spirit: 2. Partly the same, being endued with a volatil and simple, and with an oleous acrimonious Salt, as Mustard, *Erysimum* or Hedge-Mustard, Water-creffes, which are like a spur to it: for Choler consists chiefly 1. of Oleous, Sulphureous, Balsamick Parts; 2. of volatil Saline, both which are immersed in a little watry mucilage, and limited with watry Particles: Hither belong also sweet things, which encrease choler, and that by contributing partly mucilaginous clammy parts, whence also the same are said to breed Obstructions; partly Sulphureous also, if they happen upon an hot and dry Body: And these are good in an *Anasarca*, as also partly in an *Ascites*, a serous Ca-

chexie, loose Tumours; and where in other cases there is need of rarefaction of the Blood, for such things as then more intimately rarefie, the same do exalt choler: They likewise profit the Phlegmatick that have no gall as it were.

III. Having hapned to mention sweet things, we must see why *Galen* 8. de Comp. Med. 1. 1. writes that Raisins are familiar to the Liver in their whole substance; and why the same thing is not equally attributed to sugared things. That familiarity of Raisins with the Liver gave foundation to the Electuary of Raisins in *Riverius* that notably strengthens the Liver: The reason may be, because they temper the fluxility and sluggishness of the choler, and kindly moisten withal, which sugared things do not do.

IV. And the choler is temper'd and bridled when it exceeds, both by accident, by certain openers, as Preparations of Succory: (where note, that some things are called coolers, which yet are hot, as we may see by these mention'd, inasmuch namely as they loosen the stoppages and cleanse gently withal, partly evacuating Cholagogues;) and also per se, by 1. Diluters; thus when choler offends, the Whey of Goats Milk with a little Cinamon, &c. is good, whether the anima of Rhubarb be taken with it, or the elyxus of Antimony be dropt into it, both which I use with success: hither belong mineral Waters, Potions, &c. Now these very Diluters are a vehicle to Aperients; whence note that in the Jaundise such Aperients as dilute more, and in the Dropsie such as dry more, profit most: And those very Aperients that are diluters withal, do set the lymph at liberty, and make its motion free, and withal restore the Serum which is, and is called, the bridle of choler. 2. Bitter things, which both cleanse, and open the Pores of the choler, so that it is hastened more to the Guts and evacuated: the vertue of Wormwood, Aloes and Rhubarb is known: 3. Acids; hither belong *acidum Tartari*, red Sanders, or the red Liverwort of *Dresden*; because these do tame and blunt the Sulphureous part of the choler, and fix and enervate the volatile Saline: 4. Earthy and absorbing Remedies, especially the Nitrous and Alkaline; thus also lixivial Salts themselves belong hither; likewise Shells, Corals, Perles, species and Pouders, &c. likewise Nervines themselves, or Cinnabarines, which I have found profitable in Diseases of the Liver; and I have happily cured a stubborn Pain of the right Hypochondre, with Tettters breaking out all the Body over, with these especially. For it is to be noted, what Experience testifies, that earthy Medicines do precipitate and absorb both choler or cholerick Humours, and also acid and even serous Humours: whence we cannot absolutely conclude, that wheresoever Alkaline Medicines profit, there an acid offendeth; for Experience witnesses, that the earthy profit in many Patients and Diseases, where by the consent of all an acid offendeth not, but the choler regurgitates and is frothy, which they dissociate, inhibit, and bridle in its preternatural motion.

V. Lastly, The tone and fibres of the Liver are strengthened, both by 1. Moderate Astringents; whence it is a common opinion among Practitioners, that it delights in Astringents: 2. Absorbents, especially Steel ones, and the vitriolated that are made of these: 3. Correcters of any excessive temper, but chiefly a moist, and consequently a loose: Hence Mercurials also, and *Mercurius dulcis* in particular is greatly commended, by which with a Bezoartick Steel Remedy *Sennertus* writes that one was cured who was given over in a Dropsie, & that on no other account than because *Mercurius dulcis* makes the Serum fluxile, whence it opens Obstructions, cures Looseness by diverting the Serum another way, and thence evacuating it by convenient ways, &c. Thus Antimonials likewise are good, inasmuch as they notably precipitate and dry, dissolving the superfluous Humours.

VI. So

VI. So Steel Remedies do chiefly perform this; whence there is a caution given concerning their use by *Gul. Gilbert* in his Book of the Load-stone (i. cap. 15.) who says, that Steel is granted in loose Livers and moist Maladies because it dries; also in the Green-sickness, over-grown Spleens, namely where moisture abounds: but he denies it greatly in obstructions, and consequently in the Dropsical and such as have Scirrhus Livers, in the Jaundise, Hypochondriack Melancholy, to whom, he says, it is given to the certain destruction of Thousands: *Fallopian* affirms the same, and **Conringius* grants it only to Scirrhus Livers that are swelled with water, as they generally are. But I will moderate these things thus: wheresoever there are obstructions of the Viscera, the Liver and Spleen, with moisture exceeding and the Liver not too dry, there Steel Remedies are more convenient in a dry form, as *Crocus Martis*, *pulvis Cachecticus*, *flores Martiales*: but wheresoever there is both driness and Scirrhus, there the more moist preparations, or at least not without diluters. So likewise *Septalius* and others write the same of Rhubarb, that in a dry intemperies it is rather the death of the Liver: but the same things hold in it as we have now said of Steel Remedies.

VII. Note that the Liver is hurt by the over-long use of openers: whence those erre who endeavour to expell the obstructions of the Vessels by Incisers, volatil Acids or aperient decoctions alone: so that where there is an obstruction of the pores, we must open, but so, as that it be not done with violence. Such examples are often seen in the Hypochondriack.

VIII. Note also that neither have astringents place always in Diseases of the Liver: we said indeed that firengtheners should be also tonicks, but there are cases where we must abstain from astringents; for instance, if the Liver grow Scirrhus, in the Jaundise, or stubborn obstructions they are not alike profitable. Now we call those astringents that hinder the tone of the Viscera from being loosened. Hence those things that have an astringent faculty, operate with a thinness of parts; those that open, with earthy parts.

IX. This also is to be noted, that we must not trust to Syrups amongst Aperients and Hepaticks: for sweet things are apt to hurt the Liver because they turn into Choler, whence obstructions are apt to be bred.

The amendment of the harm they sometimes cause. XVI.

Being applied outwardly, they are not to stay long on. XVII.

Let Laudanum be prepared without Henbane. LI.

I. Concerning the right use of Opiatick Pharmacy these four things following are to be observed, viz. before we give a Narcotick Medicine we must consider 1. what such the constitution of the Patient is. 2. What such the Disease is that he's ill of. 3. In what state the Animal Spirits are with respect to both Animal and Vital function. 4. Lastly, in what condition the Blood and other Humours are. As to the first, when an Hypnotick is indicated, see that the temperament of the Patient, the habit or indisposition of his Body, his custom, or manner of life do not contraindicate: As for example, Those who are endued with an indifferent stature, a firm and well set Body, hot Blood, a lively or sharp aspect, bear this Medicine better, and take it often with benefit; but they shall take it more securely if they have moreover been formerly us'd to it. But on the contrary it is not so convenient, yea sometimes it does a great deal of hurt to them who are over fat, or lean; as likewise to those who being either of a rare texture have their Spirits easily dissipable, or of a colder temperament and have soft and flabby flesh, and are of a sluggish and indocible disposition, and dull and drowsie of themselves: to which hindrances or scruples this may be added and encreases the weight of the rest, if they have never taken this Medicine before.

The

Hypnoticks, Narcoticks.

(See Anodynes.)

The Contents.

In the using of them there are to be consider'd the constitution of the Patient; I.

The nature of the Disease; II.

The tenour or condition of the Animal Spirits; III.

The state of the Blood and Humours. IV.

Cautions in their use. V.

They are enemies to the Stomach. VI.

Let them not be given in the beginning of a Paroxysm or near a Crisis. VII.

They are not to be given after Blood-letting. VIII.

They should be taken at a good distance from eating. IX.

How their too great Operation is to be restrain'd. X.

Things indicating their use. XI.

We must not mistake in the Dose. XII.

Laudanum strengthens all the Faculties, and is safely given to Children. XIII.

They are not convenient in a simple hot intemperies; XIV.

And where thick juices abound. XV.

The Nature of the Disease is sometimes of great moment for or against Opiats: In slighter Distempers it is the part of a flattering Physician (according to *Septalius*) to use them: moreover in some great ones their use is either forbidden, or is held very suspected: In the Palsie, Vertigo, Nightmare, Apoplexy, also in the *Orthopnea* or great difficulty of breathing, in a Dropie of the Breast or Abdomen, in numbness or trembling of the Joints, in very malignant Fevers, and in the fits of Agues, or the crises of other Fevers, Narcoticks are very often forbid: Moreover in a cough with much and thick Phlegm, in an *Asthma* and in whatsoever other Distempers of the Breast with oppression of the Lungs, and in Hysterical fits and other convulsive ones they are but seldom to be given and not without caution and the advice of a skilful Physician. But in a cruel Head-ach Catarrhs, Colick, Pleurisie, ordinary Fevers, Vomiting, Dysenterie, fits of the Stone or Gout, and in all pains whatsoever Opiats are not only allowed, but we have recourse to them as to Divine panaceas.

III. And as often as we intend to make use of them we must also consider in what tenour the Animal Spirits (over which dominion they preside) are: for if being fewer or oppressed they already flag, and do not spread their sails enough, certainly they ought not to be further lessened and cast down by Opiats: Wherefore if so be the Animal faculties be not vigorous both as to sense and discourse, or do not exert themselves briskly enough; or when the pulse and respiration have the turns of their reciprocations but weak, or swifter, or also slower than usual, hindred and unequal; or lastly if a numbness and enervation shall seize upon the membres and motive parts with an unwonted languor, we must wholly refrain from any hypnotick Medicine: But we shall not stick to use them, if they are indicated in the greater Diseases, and if withal the Animal Spirits be strong enough in these and other respects, or become too much expanded, or immoderately fierce and outrageous.

IV. Yet the state of the Blood and Humours is not to be neglected in the mean time, because sometimes their naughty condition does wholly forbid Opiats, or suffers them not to be used unless sparingly and with some restriction. The Blood does contraindicate their use, when it offends either in its quantity or in its quality, or crasis. As to the former, it either abounds or is defective, and in both respects it hinders Narcotick Remedies. For first, if at any time the Blood being turgid through plenty, and withal boiling in a Fever, do greatly distend the Vessels, and so the heart greatly labour to drive it most quickly about, (lest it stagnate or overflow any where) by a very swift repetition of its systole's, truly in such case to give a Narcotick, to hinder that labour and endeavour of the heart, without which life could not be maintain'd, were the part rather of a poisoner than a Physician: wherefore in a *Plethora* bleeding ought always to be premised before the use of Opiats. Secondly, nor is there fear of less mischief from Narcoticks as often as they are given in defect or penury of the Blood, as after great hemorrhagies, long fasting or long continued sickness; because seeing the rivulet of the Blood is but small, and through its smallness hardly continuous, lest its flowing be interrupted and therefore cease, the heart by beating very swiftly, as with doubled endeavours, strives to drive it about most quickly: Hence it is obvious to conceive how great harm Opiats do, which put a stop to this endeavour of the heart that is then chiefly necessary. Indeed for this reason it seems to be that we forbid sleep to women presently after Child-birth when their *Lochia* flow plentifully, or to any persons after a large letting of Blood or great hemorrhagies, namely lest the Spirits being recalled in sleeping

leave the heart so destitute, that it cannot quickly enough drive about the lessened stream of Blood. Moreover sometimes the Blood offending in its quality or crasis, contraindicates the use of Opiats, because whilst in a Cacochymie or Fever, the Blood being very full of recrements ought to be agitated with a greater endeavour of the heart and to be more quickly circulated, namely that the heterogeneous particles may be subjugated and soon evaporate, the intervening operation of a Narcotick stops these attempts of the heart, and therefore hinders the lustration or clearing of the Blood, and sometimes frustrates it. As to those other recrementitious Humours that use to be heaped up within the Stomach and intestines, 'tis fitting that these also should be withdrawn & purged forth by vomit or stool before an Opiat be given; for otherwise being fixed there they will stick the more stubbornly; because the Splanchnick fibres, being stupefied by the Medicine are not so irritated as before, nor do easily enter upon or briskly perform their excretory Spasms for expelling these recrements; wherefore according to the old precept, if any thing be to be evacuated, evacuate it before you give Narcotick Medicines.

Willis Phary
mac. Rat.
part. 1.

V. We must observe concerning Narcoticks, 1. that Anodynes are always to be used before them: for seeing they make the Spirits sluggish, often induce a stupor, drowsiness, difficulty of Breath, and sometimes death it self, there is need of great caution in giving of them: 2. They are not to be used before general Remedies: 3. It is safer first to apply them outwardly, and to see whether their use suffice before they be given inwardly: 4. We must mark whether the faculties can sustain the Disease so long, as till the cause of watching or pain can be taken away by ordinary Remedies, nor must we come to them till the Patient be in some danger from want of sleep or pain. 5. According to *Sennertus* (*l. 1. p. 2. cap. 1. Pract.*) If the faculties be not very much dejected by the Disease, but only begin to be in danger through pain or want of sleep, then is it safe to give Opiats, when other things profit not: But if the Patient be not only in danger through want of sleep and pain, but the faculties are already dejected even by the Disease it self, so that 'tis doubted in a manner of the life of the Patient, then they are not easily to be given, because they hasten death and bring on a perpetual slumber.

Frider. Hoffm.
mat. m. m.
lib. 2. c. 4.

VI. Their daily and too frequent use is to be avoided, lest whilst we try to ease pain, we introduce another Distemper, or lessen the Concoction of the Stomach: For I my self have observed this to be true, that they hinder the concoction of the Stomach, for they blunt its fermental Spirit, so that it cannot exert its fermenting virtue, whence follow *Cardialgie*, weight and compressions of the Stomach with anguish.

Idem
ibid.

VII. Let them be banished in the beginning of a Paroxysm, or also when a crisis is at hand; for the endeavour and motion of Nature is inverted by them, whilst the natural heat is suffocated and the febrile heat is hindred from being expanded and the morbidick matter from being expelled.

VIII. Their use after Blood-letting is very hurtful, because the Members being then languishing and almost insensible, a deadly Hemorrhagie may easily arise: See an example in *Borellus Cent. 4. Obs. 57.*

IX. They are to be given after the meat is past off the Stomach, and three hours before eating again, lest concoction be disturbed: yet if there be great necessity, they may be administered even an hour after Supper, the vapours of the meat more easily carrying their somniferous and anodyne virtue to the Brain.

Idem p. 438.

X. When an over large quantity of Opiats has been given, *Platerus* bids us take a Lenient: but that has

has no effect to any purpose. *Wallius* says indeed that 'tis best to give a strong Purgative, but there is fear it should not work because of the restraint that is put upon the motion of the Humours by the Narcotick. *Helmonts* advice pleases me, who does very well conquer the harms and prejudices of Opiats by Lixivials, in *Duamvirat* p. 245. S. 31.

XI. Physicians commit such excesses, as in several other sorts of Remedies, so especially in those that are called Anodyne, which are made of the juice of Poppy, Henbane Seed, or the root of Mandrake, or Styra or some such like: for some to gratifie their Patients, exceed due measure in the use of these Medicines; and some that are unseasonably and immoderately wayward, in wholly abstaining from their use, suffer their Patients to be killed with pains. Therefore as in every both habit and action of a mans whole life, so here also we embrace that counsel of the wise Man, who said *Ne quid nimis*, do nothing too much: because if we may do what we wish in using Remedies to cure the Disease, we must abstain from Medicines that cause sleep: but if through want of sleep and resolution of the faculties the Patient be in danger of dying, then indeed you may seasonably use such Medicines: being not ignorant that the habit of the Body is somewhat hurt by them; but that that hurt is rather to be chosen than Death.

XII. Let not the dose be too large; we should stop pain and not overwhelm. Crude *Opium* causeth convulsions and swoonings: it ought therefore to be given corrected either in *Laudanum Opiatum*, or in Treacle: they give this latter from half a drachm, to one or two drachms. Some women every eighth day are troubled with a great Head-ach, whence by degrees Treacle becomes familiar to them, so that they ascend from half a drachm to six drachms, which no wise man ought to imitate. Let the Physician be content with half or a whole drachm. The lowest and usual dose of *Opium* is one grain or two; a great dose, three or four grains; too great, five or six grains: These things require an experienced and prudent Physician. In cold Diseases or Bodies we give less of Opiats than in hot: Hypochondriacal persons die with giving one grain of *Opium*.

XIII. *Laudanum* sometimes produces divers and contrary operations, though by accident: for while it allays pains and procures sleep, the natural heat recurs, which was dispersed through the vehemence of pain and want of sleep, to the inner parts of the Body; whence the Patient does by and by so gather strength, that all the faculties are entirely restored as it were, and the Expulsive expells what its troublesome & inimicous to Nature, which will be manifest by the following instance. Having once happily cut an intestinal rupture in a Child ten months old, and the wound was now ready to be skinned over, behold he is suddenly taken with great gripings in his Belly, so that he cried night and day: Not knowing the cause (which his parents concealed) I used in the mean time the necessary Remedies; and at length when his strength begun to fail, I gave him a grain of *Laudanum*, with a little *confectio Alkermes*, in milk: That night he rested well enough: the following day an *Echymosis* (or extravasation of Blood) begun to break forth in the sound groin, which by little and little seized upon the Hip and spread it self to the Knee and even to the Foot: yet from that time the pains and gripings of the Belly were lessened: and when three days after, I had given the same potion again they wholly ceased; but the *Echymosis* seized also upon the other Thigh, Loins and os *sacrum*, from which he was shortly freed.

XIV. We must have a care how we use them in a simple hot *intemperies*, where there is no morbidick matter.

XV. And where thick and glutinous juices abound; let soporiferous Medicines be least thought of, if the Patient be in no danger.

XVI. When too great a quantity of *Opium* has been administered, 'tis best to give a strong purgative, for so the thickned Humours are attenuated: Nor need you fear super-purgation, for that is never caused in this case. Two Physicians were accused of being the cause of a mans death; one by a strong purgative had caused a super-purgation; which the other desiring to stop, gave a Narcotick, whereupon the Patient died. ¶ If any dulness or other harm seem to be brought upon the Brain, correct it by washing with a decoction of the leaves of Betony, Mallows and Chamomel flowers: And if the Patient sleep more profoundly and longer than is expected, hold to the Nose a Sponge or rag wet with the sharpest vinegar.

XVII. As soon as the pain is appeased and the Patient lies still, let them be forthwith removed, lest a cold *intemperies* follow an hot one.

XVIII. We shall learn by these tokens when to abstain from Narcoticks: 1. When the Patient feelth not so much heat, pricking and pain in the part affected as before: 2. When to the judgment of the touch the part appeareth cooler than it was: 3. When the fiery red colour begins to grow livid and black by degrees.

XIX. Note that *Narcoticks* applied outwardly obtain not alwayes the desired effect, or do cause danger: Therefore *Mnesidemus* in *Dioscor* gave *Opium* to smell to, and *Rhasis* put it into the Ears (which yet is suspected, seeing it is an adversary to hearing:) For if 1. they be applied to the Forehead; and be not often renewed, they grow hot there, and heat the Head the more; whereupon Sleep is rather driven away than invited. 2. The Forehead bone is solid, dense and further removed from the Brain than the other Bones, whence their vertue reacheth not thither: If they be applied to the Coronal suture, they exert their vertue indeed, but they will be injurious to the Brain; most of which lies thereunder.

XX. It is worth nothing that *Hofman* (*l. de Med. offic.*) has observed, that Flower-de-luce procures Sleep, not by a Narcotick vertue, but a vaporous substance, such as also Saffron, Myrrh, &c. consist of. And they do this in cold and moist bodies, not in the hot and dry: for when in these the native heat cannot raise up vapours to the head, these hot things help it, and by breeding vapours procure sleep.

XXI. I remember that *Mich. Neucrantzius*, a very famous Practitioner, being against the preposterous use of hypnoticks in old men, with good success mingled the Species of *Diambra* and *Diamoschu* with Electuaries made of the Conserve of Rosemary Flowers, Balm and the like, to drive away troublesome watchings from them: Now the reason of this is the same with what *Hofman* gave of flower-de-luce, namely because Mosch and Ambre are fumous or vaporous. ¶ *Opium* appeases watchings and procures sweet sleep, if so be the watchings proceed not from over great driness, in which case they do no good given alone; but they do very well with moisteners, so that by this means the Brain is both demulced, and made drouse especially in old men, and otherwise where the watchings arise from over great driness, defect, Acrimony or other indisposition of the *Lympha*: Whence washings of the Head and Feet, &c. belong hither, as also other vehicles of Opiats, and promoters of their vertue. ¶ We may safely use the somniferous Sponge of *Heurnius* (*2. met. c. 7.*) seeing those that are made to sleep by it, presently awake upon its being taken off; or if they continue to sleep too long, they may be easily awaked with another sponge steeped in the decoction of wild thyme, (boiled in Vinegar together with Majoran, Smallage, and sweet Fennel Seed) applied to the Nostrils.

XXII. As cold soporificks hurt in Diseases of the *Breast*, by thickning the Humours and making them unfit for expectoration; so Flower-de-luce does excellent well in these Diseases.

Sylv. de le
Boe Prax. I.
2. c. 22. §.
113.

XXIII. Seeing 'tis easie to offend in using too great a quantity of *Opium*, it will be the part of a prudent Physician to behave himself warily in the giving of *Opium* and Opiats, and rather to give them at several times, a little at a time, than to give much at one and the same time with danger to the Patients: especially seeing the same, yea better effect may be obtained from the same Opiat given at several times than all at once.

Idem §. 31.

XXIV. Although the Narcotick stupefying vertue of *Opium* differ widely from the pacative vertue of the *Anodyne* prepared of *Vitriol*, which induces only a natural sleep, and no stupefaction (which I would have well noted of all that desire at any time to practise Physick with commendation) yet I will explain the nature of each: The Narcotick vertue of *Opium* seems indeed to be extended to the Animal Spirits, but the pacative vertue of *Vitriol* to the effervescent bile, which I think *Helmont* then calls the *fury of the Archeus*: Let all therefore seek that *Anodyne* of *Vitriol*, and esteem it for a great secret when they find it, for it performs wonderful things in curing divers most difficult Distempers.

Willis phar.
Rat. p. m.
317.

XXV. As to the Heads and Seeds of white Poppy, of which *Diacodium*, as also decoctions, Emulsions and other Hypnotick preparations are made, it is very plain that these are far less endued with a Narcotick Sulphur than the concrete juice of *Opium*, and what thereof is in these, is far more pure and harmless; wherefore we do oftner and more securely give Remedies made up of these. For it is not good to ascend to *Laudanum*, unless when through the vehemence of Symptoms *Diacodiats* will not do. Moreover seeing these contain less of virulence in them, they need not much preparation, but may be used in Medicine being only boil'd or infus'd, or squeezed: But *Opium* is very rarely prescribed simply and by it self, but is wont to be divers ways corrected and compounded, that it may become an *Anodyne* safe enough.

Primros. de
vulg. error.
4. c. 44.

XXVI. When other things have been used in vain to procure sleep, then comes *Opium*: The vulgar are afraid of it as present poison, whereas being rightly prepared and given in a convenient dose it is an innocent and wholsom Medicine. The Ancients indeed have writ that it is a poison; but that is only when it is taken in too great a quantity: but thus there is nothing so wholsom, which by abuse may not become hurtful. Now there are divers sorts of poisons; some are such in their whole substance, which kill however, or in what dose soever they are taken: others only in quantity (otherwise they may profit) as Purgers, and such things are given in that quantity as to overcome Nature; thus milk curdled in the Stomach, or juice of Lettuce are said to be poisons. But among those things which are called Somniferous, *Opium* is the most innocent: 1. Because our *Opium* is generally the *Meconium* of *Dioscorides*, which is made of the juice of the leaves and heads of Poppy; but *Opium* is a tear: Now *Meconium* is far less effectual than *Opium*, whence it must be given in a larger dose than *Opium*, to hurt. 2. We must note from *Galen* (5. simpl. 18.) that of Narcoticks some moisten, as Hemlock, Mandrake, and these are hurtful; others dry, and these are taken inwardly without harm: And 1. de Symptom. caus. he writes, Those things which cool and moisten, cause not sleep, but a *Coma*, stupefaction and *Carus*; but those which dry, as *Opium*, are less hurtful. Therefore according to the opinion of *Dioscorides* and *Galen* we need not be so afraid of *Opium* taken moderately.

XXVII. The Ancients who thought that *Opium* hurt by its excessive coldness, used altogether hot Medicines to correct it, such as Pepper, *Pyrethrum* (or bastard Pellitory) Saffron, Castor, *Euphorbium* and the like: but they were induced to correct *Opium* in that manner, by a false Hypothesis, and they made no good preparation of their Medicines. To speak only of *Philonium Romanum*, heretofore a sufficiently frequent Medicine, experience hath taught, that through the admixture of so many hot Medicines it can hardly be swallow'd but it will burn the Throat and cause an heat therein: and being mixt in Clysters, but even to half a drachm, it has in some caused a great heat in the lower Belly and freight Gut. To day it is very usual to make an extract of *Opium* with Spirit of Wine impregnated with *spec. diamb.*, *aromat. ros.* or the like; or let such Spirit of Wine be added to the extract of *Opium*, as also distilled Oyls and Cordial waters, as we may see in the various preparations of *Laudanum*. * Some find fault with this preparation of *Opium*, because it does equally deposit into the Spirit of Wine the stinking and poysonous Sulphur, which remains in *Opium* even after its having past the fire: yea being more attenuated by the Spirit it sooner exerts its Malignity and insinuates more intimately into the Parts: Whereto they add this also, that there is a certain Narcotick vertue in Wine. These therefore find out another way to prepare and correct *Opium*: They cut *Opium* into small pieces, and dry it so long in dishes set over hot ashes or other gentle heat, as till the stinking Sulphur exhale, and the *Opium* breath out a sweet and grateful smell, and may be powdered betwixt ones Fingers; which happens commonly in six or seven days time; and then they draw a tincture from it with distilled Vinegar. And they chuse Acids, as Vinegar, juice of Citron or Lemons, on this account, because as Acids dull the Acrimony of the Humours, so also the vertue of Narcoticks, and fix and suppress the stupefying Spirits: whence in soporiferous Diseases, or soporiferous poisons the use of Vinegar is profitable; and Vinegar and Acids are the Remedy of drunkenness it self. I will speak here what I think: First as to that drying and slight roasting as it were of the *Opium*, if (which yet we ought to be sure of first) there be some heterogeneous parts in *Opium*, some whereof are more hurtful than others, I will not indeed be against the roasting of it, if it be done so, as that the Narcotick Sulphur, whose vertue is desired, be not dissipated and an ineffectual Body be left behind. The correction that is made by Acids, is suspected; for although I should grant this, that acids infringe the vertue of Narcoticks and are good in soporous Diseases; yet that is not desired here, but the soporiferous vertue, which, if no harm lie hid under it, is to be left altogether entire, and therefore not to be infringed by Vinegar. Therefore as yet I see no reason for rejecting that preparation which is made with Spirit of Wine impregnated with *aromata*, because the Malignity of the Narcoticks is sufficiently corrected thereby. Nor let the Narcotick vertue of the Spirit of Wine offend any one; for the Spirit is all separated, and we use it to separate the Sulphur or Narcotick part of the *Opium* from the *faces* and impurities: and when it is separated, the vertue of the Aromatick Species wherewith the Spirit of Wine is imbued, remains joyned with the *Opium*, and corrects the malignity that is therein, and strengthens the Heart and other Viscera.

pharm. l. 4.
cl. 2. c. 394.

Sennert.
Pract. l. 1.
p. 2. c. 1.

¶ *Horstius* (tom. 2. p. 561.) makes his *Laudanum Opium* of *Opium* extracted with distilled Vinegar, adding the extract of Saffron and Magistery of Perles with the oyl of *Vitriol*, which he gives under the title of *Laudanum Opium cum Magisteriis* to eight grains for the highest dose. From the time, sayes he, that I begun to practise, I have alwayes used to fly to *Opium* rightly corrected, as to the only refuge,

fuge, in the greatest and most dangerous Diseases; in continual Fevers, with a total want of sleep, with restlessness, and when the strength was almost spent, (*obs. 22. l. 1. de febr.*) in the most violent Colick pains, in a stubborn Bleeding at the Nose, (*obs. l. 1. de febr.*) in the overflowing of the Terms, Dysentery, pains of the Joints, Tooth-ach, Hysterical convulsions, an hidden Cancer, Phrensie, Melancholy, Madness, great wounds and great Chirurgical Operations: yea also outwardly in stanching the Blood of wounded Arteries. See *obs. 3. l. 10. Barthol. Ep. 46. cent. 3.*

XXVIII. The famous Remedy of *Opium* bears away the bell from all in driving away watchings, and in stopping too great evacuations both of Natural and unprofitable Humours. No error can be omitted therein, if the just dose and fit time be observed: but if people doat, perhaps the latest weakness will be imputed to it: sometimes some things that deserve it not, are reputed for the causes of a mans death, though they rather fall in with the time of death, than are themselves the causes of it: Thus in continual and malignant Fevers we have observed that the death of the Patient has been ascribed to the malignity of this generous and heroic Medicine, although given in a just dose, yet at a wrong time, namely in the agony: so that he whom Fate slew, was thought to be kill'd by this Remedy.

XXIX. Though, as *Galen* shews (*5. simpl. 18.*) there be divers kinds of Narcoticks, some whereof act by a manifest quality, as Hemlock, Mandrake; others by an occult, or by their whole substance, as somniferous Night-shade; which are rarely used by Physicians: yet *Opium* is the principal Narcotic, as being least hurtful, if corrected. I use it more securely being thus prepared: seeing according to the opinion of some Physicians the crude hath an exulcerating vertue, it is first to be dried and to be freed from its excrementitious moisture (under which its exulcerating vertue lies hid.) Where yet we must note, the fire is to be administered warily, lest it contract an *Empyema*, or be quite calcined, and so the anodyne Sulphur, which it has hid in in its Bowels, be lost: afterwards let it be extracted with distilled Vinegar, which draws forth the Salt and Sulphur of the *Opium*: for the Spirit of Wine only extracts the Sulphur, and leaves the Salt untouched, whereas its vital strength is in the Salt, and by means of the Vinegar the tyranny of its malignity is fitly tamed withal.

XXX. Seeing it would be tedious to reckon up all the species of lesser hurts that Narcoticks ever use to do, we will only rehearse here those mischiefs which by their improper & unseasonable use happen sometimes in the Head, or in the Breast, or in the lowest Belly. As to the first, it is commonly enough known, that the principal functions of the Soul, viz. memory, discourse and sharpness of wit are often notably hurt by Narcoticks: the frequent use of them weakens the memory in many. I knew a man that lost that faculty quite by taking too large a dose of *Laudanum* in a Fever: I know that some have by this Medicine contracted a dulness or stupidity of wit, and others madness. And the reason why *Opium* is devoured by the Turks in great quantity without any harm, or however without any danger of life, is, because its particles, though at first inimicous and poisonous to the Spirits, yet by frequent use become at length more agreeable and familiar: as we observe concerning the smoak of Tabaco taken in a pipe; for whereas at the first it uses to cause giddiness, and often Vomiting or Purging, yea cold sweat with trembling and often faintings, yet after a while we take it without disturbance, yea with great delight. And the reason why a larger dose of *Opium* adds courage and notable boldness to them, so that they can enter upon a fight without fear, I say the reason

seems to be, because this Medicine by somewhat stupefying the Spirits makes them amazed, so that they can undauntedly endure the approaches of sensible things howsoever terrible.

XXXI. That Opiats are sometimes inimicous to the *præcordia* and Breast, is clear enough from hence; that they depress and diminish the pulse and respiration, and sometimes cause them to faulter, and by degrees to cease utterly. Wherefore in Fevers, where the Blood being notably depraved promises either no crisis or not a good one, and withal affords only few and weak Spirits to the Animal government, Narcoticks are almost always hurtful and poisons as it were. For though in the pestilence and malignant Fevers, whilst the pulse and respiration hold out well, Treacle, Mithridate and *Diascordium*, yea and *Laudanum* also are often given with profit: yet if at any time in these Diseases, or other Fevers that are not very malignant, the vital function languish, we must use those famous Antidotes very sparingly, but the stronger Opiats not at all. Moreover in a toilsom Cough, Phthisick, Pleurisie, Empyema, and in other Diseases of the Breast, namely in whatsoever Distempers Nature is incited and striveth with all her endeavour suddenly to discharge her self of that which is troublesome and oppresses the Breast, and withal the organs of respiration, wanting a sufficient plenty of Spirits, do faulter, and difficulty perform their work, we must abstain from *Opium* no less than from rank poison: for in such a case Narcoticks do encrease and fix the weight that should be removed, and lessen the strength of the parts which should throw it off.

XXXII. It is found by experience that Opiats do operate in the Bowels of concoction and other parts of the lower Belly, and help them often notably in divers respects: but it will be easie to shew that often they are not so friendly and kind to this region, but that sometimes they do great hurt thereto. For Narcoticks being often taken are sometimes very injurious to the principal faculty, namely the appetite of Meat (whereupon depends all nutrition and the root of life) as very much dulling it and often quite destroying it: Because when the Spirits inhabiting the inmost coat of the Stomach are stupefied or destroyed by the particles of the *Opium*, so that the nervous fibres, though never so much emptied, are no longer contracted or shrivel'd up, thereupon all hunger ceases, and aliments are not at all desired: yea when they are offered to the Stomach they are presently refused, because they would cause rather trouble than pleasure. Moreover for the same reason the concoctive faculty of the Stomach is often weakened, and the excretory motions both of it and the Intestins grow sluggish: for it is a common observation that slowness of concoction and dulness of the Belly (or costiveness) are familiar effects of Opiatick Medicine.

XXXIII. The simple Extracts are often better than the compound, especially when they are not combined to one and the same scope: thus the extract of *Opium*, or most simple *Laudanum* made only of *Opium*, is far to be prefer'd, in my opinion, before all the *Laudanum's* to be had up and down, made with the essence of the species *diambræ*, *diamoschu dulce*, magisterie of perles, &c. For these things are far better added at the time of using it, according as the intention, or the variety of circumstances are.

XXXIV. *Opium* hath a notable vertue to hinder and bridle the vitious effervescence of Acrimonious Humours, both in the small Gut and in the heart and elsewhere, without which, hurtful and sharpish *halitus* use not to be easily raised, which we must powerfully both concentrate and discuss with salt, volatil and oleous Medicines intimately united by the help of art.

Laud. M.S.

XXXV. *Laudanum* taken immediately before meat is more effectual especially in driving away pains; and in Dyfenteries it is good to take it not long before eating, for so it exerts its vertue the more strongly.

Idem.

XXXVI. Let it never be taken on the day before Purging and Bleeding, because it dulls the Spirits and hinders the Blood from flowing freely; for no Narcoticks whether taken by the mouth or injected in Clysters, are to be given before purging, because they hinder its operation.

Idem.

XXXVII. Let it be given in a fluxion from the Head upon the Lungs, for it thickens the matter that requires expectoration; otherwise the Patient would be choaked.

Idem.

XXXVIII. It often powerfully causes sweat the next day, and that plentiful, especially about the Head and Breast, sometimes all over, of which the Patients are to be admonished.

Idem.

XXXIX. Often after awaking, the pulse is languid, and the Patient very weak; in which case he must be helped by giving him some Wine to drink, or Vinegar to smell to, or rubbing his pulses with Vinegar of Roses.

Idem.

XL. It very frequently stops a flux without sleep, allayeth pains and strengthens the parts; in some the first day, in others after it has been given a few times, Nature being accustomed to the Remedy.

Idem.

XLI. The day before the Crisis was to be I have given it an hundred times with good success, yea to many when no signs of a Crisis appeared, and yet upon the giving this Medicine there has follow'd a crisis the next day, chiefly and for the most part by sweat.

Idem.

XLII. A Phlegmatick Vomiting follows the giving of it in those whose brain unloads it self into their Stomach, because Nature being made drouisie and the heat dulled, concoction and distribution are not duly performed; whence it comes to pass that the Stomach being loaded does disgorge it self the day after; which the Patient must be told of beforehand, though with some doubting.

XLIII. The next morning after, there is often also a suppression of urine, which is to be provoked by a proper clyster, or with a fomentation of pelltory and chamomel fried in Butter and applied from the Navel to the pubes.

Idem.

XLIV. It may be given with Purgers in Diseases that are very tormenting and painful: I have given it in the Colick proceeding from Choler, with *Mercurius dulcis* and *Aquila rubra*. One Mr N. being sick of a continual and malignant Fever with cholerick vomiting so large as to vomit above fifty times in 24 hours, when he had tried all Medicines and aliments in vain, I stop't his vomiting by some grains of *Laudanum*, given with 2 scruples and an half of *pil. cochia*, upon which he fell asleep, and after five hours went to stool, the stinking choler being turn'd that way.

Idem.

XLV. In the Colick with an Inflammatory disposition, if you give by the mouth or inject by Clyster a Narcotick, take heed of Purgers the next day; for while they stay long in the Body they increase the Disease, as I have learn'd by experience in the Abbat of S. Martins; he slept, and was eased of his pain without relapse; and though the operation of the Purge were slow, yet he went to stool four or five times, and cholerick stuff came away; however there arose a slight salivation.

XLVI. When Narcoticks are given with Purgers, the quantity of the Purgers is to be increased, because the Narcotick vertue blunts their sting; as if half a drachm of *pil. cochia minor* be enough otherwise, let two scruples or two and an half be given with a Narcotick. And let Narcoticks be given with Purges that have *diagridium* or *coloquintida* in them, whereby Nature may be solicited to ex-

purgation; and if the Purge stop, let it be called out by an acrimonious and provoking Clyster. Observe this carefully when you give Narcoticks with Catharticks.

XLVII. In the Plague it is a principal Remedy being mixt with Cordials, namely because by its congealing vertue the Arsenical Spirits, that are most deadly to the Heart, are fixed as it were, and the matter which is most pernicious while it is in flux, is staid and remains almost unmoved: whence it comes to pass that Nature recollecting her strength can the more easily apply to her self the vertue of the Remedy and Alexipharmacks. For in the Plague it provokes sweat, especially if mixt with Cordials. As for example: Take of the water of Scabious, Meadow-sweet, *Cardus bened.* *scordium* of each an ounce, of the Electuary of an Egg a scruple, of the Salt of Wormwood and *Card. bened.* of each eight grains, of *Laudanum* two grains: Make a Potion, which is to be given especially when a Phrensie and burning Fever rages. This was tried in the Daughter of *Ghesnault* the Apothecary. See *Gesner* in his Epistles (and also above, Book 6. under the Title of *Pestilential Fever* and the *Plague*) who uses *Opium* for a Sudorifick in the Plague, A Doctor of Physick being sick of the Plague, Phrenetick and exceeding Cholerick, by taking *Laudanum* came the next morning to himself, the Malady returning again towards evening, to which the same Remedy brought the same ease. He was let Blood twice or thrice, Cordials were given him, especially *Contrayerva*: About eleven his pulse was tremulous, all signs of death were present: Spots like Flea-Bites broke forth: there was a great Carbuncle about the os sacrum: *Laudanum* was given him, he slept, and at last recovered: he took it six times commonly in a day.

XLVIII. In continual Fevers, especially the burning, it is good to cool the heat, allay thirst, appease inquietude, procure sleep, strengthen Nature, and to promote its Critical motion and endeavour: It often happens that on the very day or the next day after it is given, the Fever is extinguished without return. But observe, not to give it the day before solemn Remedies. (See above, §. 36. Idem. 45.)

XLIX. It is sometimes profitable a little before the Fit in Tertian Agues, the Body being first well Purged: Whether is it because, the motion of the morbidick cause being appeased or rather hindered as it were, its ascent up to the Heart was hindered and intercepted, and therefore the *causa sine qua non* of the Fit it self was extinguished or laid to Sleep?

L. But if it be given in Agues, to interrupt the course of the Disease, let the Body be very well Purged afterwards.

LI. I approve not of that *Laudanum* which has Henbane in it, because it disturbs the mind, and makes Men stupid, dull and giddy for some hours.

Lac augmentia, minuentia, or things encreasing and lessening Milk.

The Contents.

The same things increase Milk which increase Chyle. I.

Or which make the wayes open. II.

Things that repel the Milk are better applied to the Heart. X.

The curdling of the Milk is to be hindered by any means. XI.

I. IT seems an easie request for Women, to desire the increase of their Milk; yet the Physician often finds it great enough, if he will undertake to gratifie it. As for the things that increase Milk, they either 1. Increase the Chyle and the more serous and chylous parts of the Blood, not only alimentous things that are easily convertible into chyle and blood, as rear-Eggs, Almond milk or Pottage, plentiful drinking, Cows Udders which are better reckoned among Aliments than Medicines, because they easily contract an hogo; but also Medicamentous, which have oily parts that communicate and are immersed with watry, which is very suitable to the chyle and milk (which is nothing else but the substantifick oily parts mixt with the watry) such as Carduus feed, &c. Other temperate oily things have the same effect also, as the Seeds of Fennil, Parsnip, &c.

II. Or 2. They open the ways, and free the Pores, so that the Milk may freely flow to the Breasts; whence Langius says that all Sudorificks, to wit the kindly and temperate, work that effect; namely absorbers, that hinder coagulation, and by their alkaline Nature (as Salt is the interpreter of the conjunction of oily Parts with watry) procure this commixture: Thus the same Person commends as a secret the decoction of dried Elder flowers in Cows milk, as a most approved Experiment. Likewise Crystal prepared, Earth-worms prepared, and before all Lat Lunæ: Periwinkle also is good taken any way.

III. Or 3. They promote the afflux of the Milk to the Breasts, as Frictions, and fomentations of Decoctions: fresh Burnet laid between the Breasts is commended. Among Minerals Crystal, and especially Quicksilver is powerful, as appears by the tryal of the Women at Padua, who when their Milk fails buy for themselves of the Apothecaries a silberd shell that has the kernel got out of it through a little hole bored in it, and fill'd with Quicksilver, the little hole being stop't with wax; and hang it about their Necks to restore their Milk, which falls out according to their desire. * H. Saxonia gives a double reason of its manner of acting, 1. That the Women are of opinion that it is good for fascinations, and that when the Milk is lost by bewitching, it is restored by this means: 2. That Quicksilver has a vaporous substance in it, and is of so thin parts, that it cannot only insinuate it self into all the thinner parts, but can also dissolve and digest gritty Tumours: whence he argues that it therefore profits in the failure of Milk, because it can fuse and attenuate the thick Blood, which for its thickness and clamminess could not enter into the *Vena Mammaria* and Glands: We have adviced the same thing with success; but the effect in this case is rightly ascribed to the Quicksilver, because it makes the Humours, viz. the Blood and Serum, more fluxile, whence it is more strongly stir'd up to motion, and Milk is collected in the Breasts according to Nature.

IV. Those things that provoke the Terms do not increase Milk; for they are both contrary indications and opposite motions. Now though it may be alledged to the contrary; that by Experience the flowing of the Terms and the presence of Milk may stand together, and that some things, as Fennil, promote both; yet if the *thesis* be understood of those which are properly so called, viz. those which penetrate and drive forwards more strongly, it is true and hath a real foundation.

V. Lesseners of the Milk act either 1. By softning and loosning the wayes; for all Milk that restagnates and finds no exit by Sucking, curdles, whence the Breasts are swelled, inflamed, and are often suppurated. Hence it is an approved Remedy * to apply Emplast. & Diachylo to the Breasts in this case; for spreading a Plaster hereof all over the Breast, leaving only an hole for the Nipple, the Milk either flows out or is wasted without Pain.

VI. Or 2. By discussing or resolving the restagnation, which being done, those things are not only profitable inwardly which promote a regress into the Vessels and dissipate, as Bezoardick Sudorificks, but all such things also which hinder curdling or coagulation; whether they be effectual Emollients, as *Sperma Ceti*, (whence *Timæus* writes that there is nothing so good for a swelling of the Breasts through the plenty of Milk, as *Minsichtus's* Cerecloth of *Sperma Ceti*;) or be endued with a volatil Sulphur or Salt, as Camphor, Saffron, which yet is to be used sparingly; or Salt things, whence Women are wont to lay upon their Breasts Saffron, Salt and Sage, as a cheap and easie Remedy; or bitter which hinder coagulation, and are Enemies to the consistence of Milk; whence those things which lessen Seed, lessen Milk also, as Mint, Hemlock, Wormwood. Outwardly also Frictions with things that are not rough or rugged, as with a Weazils Skin, dissipate notably; likewise to rub them with a soft brush. Milk is also discussed by this vulgar Experiment: If a Woman that gives suck would have her Milk to dry up soon, she milks out her Milk upon the Coals, and in a little time her Breasts grow flaggy: which yet is but an indifferent Remedy; in a slighter case indeed it profits, as we have tryed; but in a greater very little, as often all other things. Women need not be afraid that no Milk at all will return afterwards, for that is contrary to Experience.

VII. Or 3. By hindring the further afflux, such as are both Astringents, as it's usual to apply a quilted Bag with the Powder of Myrtle Berries (open in the middle) and to anoint the Breasts with Oil of Myrtles, though 'tis better to let Oils alone; and also Repellents, whether earthy and watry, as, of common white bole and cerufs make a mass with Rose-water and apply it; or acid, as simple Vinegar or saturnis'd, whether applied alone, or mixt with discutients; whence that notable Experiment of *Morrellus* (Pag. 567.) viz. a Sponge dipt in the decoction of Cummin or Coriander seed with the sharpest Vinegar: hither belong Oxycrate, Ointment of Roses, a Cataplasm of the flower of Beans and Vetches, Cummin-seed, with the juice of Nightshade and Plantain, Vinegar and Oil of Roses: *Pliny* commends the Dregs of Vinegar. And these are useful in three cases, whether in weaning of Children, which may be a good while in doing, and so the matter succeeds more happily; or when the Children die, where it is more difficult; likewise for Preservation, by Persons of Quality, and others, that will not nurse their own Children, in which case I have often used Plasters with very good success.

VIII. Fat things are not to be applied to the Breasts in the restagnation of the Milk; for they not only moisten more, and cause a greater influx, but are apt to cause an Inflammation when there is none, or to increase it when there is: whence as often as we have seen fat things applied in Pain from plenty of Milk, we have almost as often observed Suppuration to follow. Discussers are better in that case, such as Lime-water, which is as good as any thing in the world to hinder all Inflammation, and to cool and discuss.

IX. Repellents are not to be ordinarily used for the Breasts, both because of the Neighbourhood of the Heart, and also because they are apt to curdle the Milk, and fasten as it were and hinder the

D d d d d 2

motion

Miscel. Curios. p. 46.

* Pract. Med. p. 558.

* Willis de feb. p. 289.

motion of the fluxil Humours, that they cannot so well pass back, be discussed, or flow out: hence they are not to be applied but in the beginning, and then only the milder, or mixt with Digesters.

X. Things that repel the Milk are better applied to the Back, namely that the liquor which is about to flow to the Breasts may rather be averted, than when it is already therein, should be detained amiss. Thus for this purpose I have tried the Plaster *ex spermate ranarum* applied to the Back; and before, *Empl. diachylum*, to very good purpose; for so the Milk that is going to flow into the Breasts, is stoppt as it were in the way, and that which is already flow'd in, finds an exit: which we may imitate also with other such like.

XI. The coagulation of the Milk is to be hindered by any means: but if it cannot be softned and discussed, Suppuration is to be promoted. Hence resolvers are always to be put in such Medicines, of Smallage, Cummin and Coriander Seed, &c. likewise acids are to be mixed with Incisers. Moreover all that we have mentioned have place when the matter is as yet within the government of Nature, so that she can apply these Remedies to her self: but if not, there is no other Remedy but Suppuration, which is performed by the more penetrating Emollients, especially by Linseed Oil, Honey, the flower of Linseed, yolks of Eggs, Turpentine, &c.

Lac, Lactis Serum, or Milk and Whey.

The Contents.

- Sometimes one sort of Milk, and sometimes another are requisite according to the variety of Indications. I.
Whether it be always to be forbidden for the Conditions in 5. Aph. 64. II.
When Milk or Whey are to be given crude, when boil'd. III.
Where it is necessary and yet does harm, what may be used in its stead. IV.
It is not to be taken with Bread. V.
If part of it stop in the Mesentery, how it may be excluded thence. VI.
When Asses Milk is to be preferred before Whey, and when on the contrary. VII.
A Fever does not always hinder the use of Asses Milk. VIII.
The powerfulness of Milk in sundry Diseases. IX.
The Whey of Asses Milk is effectual in Obstructions. X.
Goats Milk fills the Head. XI.
Whether distill'd Milk cool more. XII.
The way to make Whey that will pass through quickly. XIII.
In internal Inflammations it is not to be depraved by acids. XIV.
It is sometimes hurtful. XV.
When it is used for a long time, let it be made loosening. XVI.

I. THE Ancients used Milk very frequently: for they often made use of it to Purge slightly, to wash and attemperate after Purging, and very frequently to correct the acrimony of the Humours, and lastly to thicken. And as the thinnest of all was chosen for Purging, (as Asses milk) and was wont to be given for that purpose in a notable quantity; so the thicker was preferred for thickening: But in other cases a mediocrity of substance was lookt after, either thickening it by boiling, or on the contrary making it thinner by mixing divers liquors with it: for they used both Cows milk, and Sheeps and Goats milk, as the case required; but with this distinction, that when they intended to Purge, or to wash down the Belly,

they gave it in the largest quantity: for Hippocrates gave sometimes a Gallon for that purpose, but in other cases seldom above a quart, that it might be detained and concocted in the Stomach. When therefore he says in the 5. Aph. 64. that it is bad to give Milk to those who are troubled with the Head ach, &c. he speaks not of that which is given in a great quantity to Purge withal, for that, to speak properly, is not *lac dare*, to give Milk, but rather to Purge with Milk, which manner of speaking was usual with Hippocrates.

II. Nor does Milk given thus bring those inconveniences that are imputed to Milk given otherways: and the reason is, because it makes no long stay in the Stomach, so as to be able to send forth vapours to the Head, or cause *flatus*; and because being taken in a large quantity, it is not subject to the danger of corruption (for on these things the hurts of Milk depend.) And that this was Hippocrates's meaning may be demonstrated from his Doctrine, seeing he uses Asses or Goats milk diluted in all cases wherein it is forbidden by the present Aphorism; for he uses it in Ulcers of the Head, 2. de Morb. v. 158. and in the Falling Sickness, 4. Acut. v. 52. In Fevers he very often prescribes Purging with Asses milk, in a Quotidian from Cholera, and in the Fever called Interficient, 2. de Morbis; in a burning Fever, 2. Acut. v. 10. in Diseases to which an acute Fever is joined, for instance in an Erysipelas, 2. de Morbis: Nor does he deny it to them whose extended Hypochondres rumble, when he gives Asses milk both to the Hepatick and Splenetick, even such as incline to a Dropsie, to Purge them, 1. de int. affect. v. 113. Further he disallows of Milk to those who have had a large evacuation of Blood, and yet 4. Acut. he commands those to be Purged with Asses milk who have had a large flux of Blood. Seeing therefore Hippocrates uses Milk to Purge withal in all cases wherein it is condemned by the present Aphorism, we must affirm that *lac dare*, to give Milk, signifies not Milk to Purge withal, but that Milk which is given for nourishment or alteration: which is confirmed by this, because reckoning up the cases wherein it is profitably given, he only rehearses those that want nourishment, I mean the Consumptive, Persons afflicted with long Fevers, and the too much extenuated, whom we may by no means Purge, at least very rarely. P. Martianus upon this Aphorism thinks, that it is thus to be understood, that Milk must be obtained from where all these Symptoms come together, but not when any one of them is found alone; for if it were not so, there would hardly ever be place for Milk. Wherefore Milk will be ill in a Fever whereto all that concurrence of Accidents shall be joined; which may be collected from the last words of the Aphorism, But it is conveniently prescribed also in long continuing and slow Fevers, if none of the things mentioned be present; that is, if the Sick be neither thirsty, nor have rumblings in his Belly, nor choleric Stools.

III. Hippocrates gave Asses milk boiled in the Bloody Flux, that Purging by its plenty (for he gave a great quantity in the beginning of the Flux) the Parts might be made more firm, whence the Flux might be restrained: for in boiling, some thinner and moister parts of the Milk evaporate, which by moistening might make the Humours more fluxile: Which is observed not only in Milk, but inviolably also in Whey by Hippocrates. For as often as there is need of drying, as in all Fluxes, in Catarrhs, and other such like cases, he always uses both Whey and Milk boiled; but raw, when he would loosen and moisten, and where it is expedient to keep the Belly loose. Which distinction when Modern Physicians neglect in giving Whey, that use it indifferently not only boiled, but twice or thrice filtrated, 'tis no wonder they are so often frustrated in the end intended.

v. 10.

IV. If perchance natural Milk, either through an occult property or manifest quality, be not pleasing to the nature of the Patient, (which for the first days ought to be Asses's, because it cools more than Goats, viz. for the first twenty days, but for the following forty, Goat's) use an artificial in its stead, for the first days likewise more cooling than nourishing, but for the rest cooling and nourishing. Take of cleansed Melon-seeds an Ounce, of the four cold seeds of each half a Drachm, of the water of Mallows and Gourd of each five Ounces, wherewith make an Emulsion: Afterwards, Take of cleansed Melon seeds an Ounce, twenty sweet Almonds, forty Pine kernels, of Chicken broth ten Ounces, wherewith make an Emulsion.

V. Let Milk be drunk warm from the Cow with a little Sugar, but by no means with a morsel of Bread, lest by staying too long in the Stomach it hurt the Head by filling of it; and let it be used above forty dayes.

VI. In the mean time that no thicker part of the same Milk be curdled and stick in the Mesentery, let the Patient every tenth day take an Ounce of the Cream of Tartar dissolv'd in Broth, that those passages may be clear'd.

VII. Why did Hippocrates, who was wont so frequently to use Whey, both to Purge and wash down, never use it in a burning Fever, though it may seem to satisfy all the intentions that occur in the cure of this Disease? I answer, That Hippocrates does here give Milk, because he supposes that in this Fever, cholerick ichors that fall upon the Belly do offend, in which case there seems no Remedy that can be thought on more convenient than Asses milk; for this by its Purging, vertue may easily draw down the foresaid Humours now stir'd up to motion, and cool all the estuating Body, and mitigate and temperate all the Juices. And because it is expedient that the Belly after it has been loosened by Purging, should remain more firm, he commands the Milk to be first boiled, which is usual with Hippocrates in all kinds of Fluxions. Nor does he fear any hurt from the Milk because of the Fever, because seeing by reason of its great quantity it defends quickly, it cannot contract such a Putrefaction from the febrile heat, as to hurt the Patient: and where (5. Aph. 64.) he forbids to give Milk to People in Fevers, he speaks of that Milk which is given for nourishment in that quantity as may be concocted in the Stomach. But seeing Whey may do the same thing, and more safely; because of the Fever which seems to forbid the use of Milk, why does he let this alone, and rather allow Milk? That may be proved to be done by Hippocrates for Three Reasons: 1. Because perhaps Whey does not carry forth cholerick Humours so as it does Phlegmatick: For though Hippocrates do especially use Whey to wash down and temperate, yet he us'd it far oftener in Phlegmatick Distempers than in Cholerick, although this will seem new to very many: who yet if they look over the places wherein there is mention of giving Whey, will find it most true: Yea 1. de Morb. mul. f. 2. v. 101. he hath reckoned Whey among the Medicines that drive forth Phlegm. 2. A second reason is, Because seeing Whey is very familiar to the offending Humour, which Hippocrates calls a bilious ichor, he is afraid lest the Whey that is drunk should be turn'd into it: for he has admonished, that on this account the cognations of juices to one another are to be consider'd, (Lib. de vet. Med. v. 434.) that we may avoid not only those things, which from their own Nature are bad for us, but those also which are so because of the cognation through which they are easily changed into a juice of alike nature. 3. The Third reason is this: He proposes not Whey in this case, because it is supposed that it is the Summer Season, in which Whey has a greater acrimony than is convenient: For 'tis certain that the

Ancients did not use to give Whey at all times; for Hippocrates never spoke of giving it, but added a condition which may respect some peculiar and fit time. For lib. 2. de morb. v. 158. and in other places he adds this condition, If the Season of the year permit. And that he abstained from it in the Summer, for the reason assign'd, is probable: for it cannot be doubted either of the Spring or Autumn, seeing he gave it to Eratolans's Son about the Autumnal Equinox: That he gave it in the Winter we may presume, seeing he used to give it in Dis-eases wherein Phlegm prevails, which reigns in Winter.

VIII. Milk is forbid by Hippocrates to Persons in Fevers, because it may turn to choler and a noxious corruption: but the same Hippocrates 5. Aph. 65. grants it to those who are not very feverish, which yet must be understood of a Putrid Fever, for who doubts of its use in Hecticks? Therefore we must only abstain from it (viz. Asses milk) in the Fit, and allow it on other days. Nor will Obstructions hinder, for those being dry may be taken away by its mollifying of them, seeing it contains neither a cheefe nor buttery substance that might cause or increase them; whence Aetius gives Asses milk to dissolve gritty Tumours, and for preservation from the Stone; and especially seeing the same Person in Quartans from aduision, even without any suspicion of an Hectick, gives Asses or Goats milk, from three to six Pints, to Purge withal.

IX. Indeed there is something divine lies hid in Milk, which I had never believed unless I had found it by my senses in those whom I have perswaded to drink it to mitigate and at length to get rid of the torment of the Gout: I have with these eyes seen them made new men as it were thereby; for by a right use of it very many have acquired a firmer habit, a better colour, and stronger Faculties: Moreover by it hypochondriacal Symptoms and the Stone have been removed, which to some will seem incredible; I could produce living Instances of this thing. But in this cure one thing is to be greatly heeded, that the Milk be not turned into clods or choler.

X. The Whey of Asses Milk is commended above the rest, not because it is colder, as some Moderns think, but because it cleanseth and evacuates more, by reason of a certain acrimony it partakes of: upon which account it is commended by Mesue even in the Dropsie and confirmed Obstructions.

XI. The Whey of Goats milk, although it cools, yet moistens; and which is of greater concern, so fills the Head it self, that those who are subject to Distillations fall into Pains of the Joints by the use of it.

XII. Some use distilled Whey in Fevers that it may cool the more: Now in distillation none doubts, but that the thinner parts ascend, and the thicker subside. But it is clear from Galen (10. Meth. c. 9.) that there can be found no cold substance that is of thin parts: Separate therefore as much as you will, you shall always have the thinner parts, and therefore the hotter, if you take that which passeth out, and not that which remains behind. Yet they contend that the thin are depurated from the Nitre, and therefore that distilled Whey has lost its purging vertue: but give but five Pints or more of that distilled Whey, viz. as much as the Ancients gave of the undistilled, and 't'll be far enough if it loosen not the Belly, yea by so much the more, by how much it penetrates the Belly better, and by its thinness washeth, cleanseth and purgeth. Hear *Libanius: Thus therefore Milk is divided into three parts, namely the Aëreal, with which is also the fiery, which may be separated by distillation; Secondly the watry; and lastly the earthy, which they call Cheefe, as the watry, Whey. Therefore according to him, that

that which goes out first in distillation, cannot properly be called *Serum* or *Whey*, but it is called the *aëreal* and *fiery* part: in the second place comes the *Whey*, and then the *earthy* or *cheesy* part is left. ¶ If you desire a more perfect Separation by the help of fire, mark that you will receive almost nothing of the *Sulphur*, for its virtue vanisheth away, &c. But after the heat comes to the other substance, which is the *Salt*, it readily ascends (because it is dissolved;) and if it find the cover close, it will remain sublimed: but if there be a *rostrum* or snout, in the cover, the thin substance will pass forth, yet not without the *Salt*; because the *Salt* of fixt has been made volatil: therefore from your distillation you shall have a liquor, that is thin indeed and clear, but full of a volatil *Salt*, therefore unfit to cool, yet more profitable for *Dropsies* and other cold Diseases, but hurtful not only for cold intemperatures, but also for dry, because it is hot and drying.

Idem cap.
ult.

XIII. *Whey* should be made just before it is drunk, and of *Milk* that is newly drawn from the Cow, boiling the said *Milk* one walm, and as soon as it begins to boil, dropping a little of the Juice of *Lemon* or *Vinegar* into it, and then taking it presently off the fire; for there will forthwith be a separation of the *Whey* from the *cheesy* part, which by straining and clarifying with the white of an Egg becomes very clear, and may be taken in a large quantity without offence to the *Stomach*, so that it is often drunk by some like *Mineral waters* with great benefit.

River cent. 1.
Obli. 98.

XIV. When the *Stomach* is inflamed, *Whey* is good, but not that which is depurated with acids; for sharp things exasperate Inflammations, according to *Galen* xi. *Meth.* 19. Put into it the juice of sweet-scented Apples.

Fortis conf.
86. cent. 2.

XV. I suspect too much *Whey*, seeing all unprofitable moistures in the *Veins* either grow fowr or salt.

Idem conf. 3.
cent. 1.

XVI. *Hercules Saxonia* gives this admonition concerning *Whey*, that if it be to be given daily in the hotter Diseases, Temperaments, &c. it is to be made loosening or diuretick, or to be given in a moderate quantity. For, says he, as I have found by Experience, they that take much of it, and retain it, grow worse: perhaps because it is vaporious, as *Milk* also is.

give great disturbance: 3. That by consequence they are communicated to the Vessels about the Liver, infect the Blood contained therein, and so may beget new Diseases, or increase those that are in being already: We must always begin at that without which we cannot safely execute something else: 4. There is no profitable substance in the mucous and cholerick Humours in the Guts, nor in the foul moisture that besets the Glands of the Mesentery and Caul: These are already separated from the profitable juice, and neither desire nor admit of concoction. 5. *Hippocrates* contradicts not, when (1. *Aph.* 22.) he bids us medicate things concocted and not crude: for there he speaks only of the Humours that are in the second and third Region. Others grant that the use of Lenients is sometimes necessary, but not always, nor in every Patient, nor in every form. 1. There is present an indication to purge, and to pull up the roots of the Disease by stronger Medicines: Our sluggishness is the cause that we cure not great Diseases, because we will never have done with Lenitives: That Physicians may avoid calumny, they commonly prescribe no Remedy that is generous. 2. When the Body is crude, 'tis safer to move nothing, especially when the Faculties are weak. 3. There is sometimes greater need of Bleeding. 4. Some when they hear of Physick, presently nauseate, especially such things as use to be given in a larger quantity, as Lenitives. This distinction is to be used, By reason of divers circumstances Lenients are necessarily premised in the first place: but sometimes they may be omitted or postponed, if the great causes rehearsed be present.

Rolfink. m.
m. spec.
P. 450.

II. Lenients for curation, when a Chronical Disease invades, must be taken before Preparatives to cleanse the first ways, in the Mornings: For preservation, to keep the Belly soluble, they must be given at the same time. Let us inquire whether it may be done before Meat, or in a short while after. *Galen* (2. de *Alim. Facult.* c. 31.) seems to affirm that Meat is not to be taken presently after a Medicine; for speaking of Prunes loosening the Belly he says thus: It is clear that after we have eaten them it is profitable for loosening the Belly to drink sweet wine, and to interpose some time, and not presently after to Dine: and we must remember that this is common to all things that loosen the Belly. Some are afraid of lessening the loosening virtue, if one either eat presently after a Medicine, or it be taken as one Dines or Sups: for they think there is danger that either the virtue of the Medicine will be dulled, or that it will be utterly corrupted from the mixture with the Meat, especially if meats be thrown in without any choice, and be contrary to the Medicine, as hard and astringent. As in the composition of a purging Medicine there are some things added to increase its operation, as *Ginger*, *Sal gemma*; so it is not to be doubted but amongst aliments there are some to be found, which do dull Purgers, and weaken their operation. 2. The same Persons are afraid of corruption, or at least of a diminution of concoction. Meats are corrupted, because Medicines are enemies to Nature, and spur her forward to Excretion: They are concocted imperfectly, whilst by the motion of Fermentation they disturb the action of Chylification, which is performed quietly, closely and leisurely: Moreover the Chyle is communicated crude to the lacteal Vessels, and the fault of the first concoction is communicated to the second. 3. Others will have Lenitives to be taken extraordinarily, either a little before, or just with the Meat. Things persuading this are, 1. The nauseating nature of the Patient, which cannot take Medicines alone: 2. The nature of the Medicines, which being not strong, do slowly execute their office: besides they cannot resist the heat of the Stomach, unless Meat taken either with them or a while after them hinder it: 3. They may also be turned into Aliment

Lenients, or Looseners.

(See *Alvus adstricta*, or Costiveness, BOOK I.)

The Contents.

- They are to be used in the beginning of every Disease. I.
- When to be taken. II.
- Some work by accident. III.
- Some per se or of themselves. IV.
- Whether they be always convenient. V. I.
- They may be given with meat. VI.
- They may be mixed with Purgers. VII.
- If Lenients suffice not to carry down the Excrements of the first Region, Purgers are to be given. VIII.
- Sometimes we must use Emollients, sometimes Cleansers. IX.
- Things sprinkled with Night-dew loosen effectually. X.
- How to loosen the Belly by a Decoction of Prunes. XI.

I. Some think now adays that we must use Lenient Medicines in the beginning of every Disease; 1. Because mens Bodies are far more filled and impure than in *Hippocrates*'s time: 2. Then unless the first ways be clear, the Humours that are to be brought forth from a far will be forbid an exit and

ment by an hungry Stomach. Experience teacheth, that Lenitives, as pills of Aloes, taken half an hour before Dinner or Supper, in the midst of them, yea or in the end of either, do their office very well, in a just dose, being continued for two or three times: the action it self may be confirmed by reasons, and strongly defended from the force of their arguments that think otherwise.

Idem.

III. If inquiry be made concerning the manner of their action and operation; we say that it differs not from that of Purgers: For Lenients irritate, both by accident, and *per se* or properly and of themselves. Those things do it by accident that dissolve the consistence of the *feces*, hinder their compaction, and make them fluxile, when they are more easily expelled, such as are 1. *things watry, moist and which may be drunk*, whence we observe that by drinking much the Belly is continually kept loose: and therefore those who have their Belly obstructed by the driness of the ordure and intestines, we profitably advise them to drink a little more freely, which unless they do, all stimulators are but in vain. Thus the whey of Goats milk besides its nitrous vertue, helps to loosen the Belly by its watry consistence. 2. *Things mucilaginous, pulposus, and such as are endued with a power of moistening effectually, and of moving and disturbing the Humours* sometimes, as Raisins and Corinths without their stones, which we have commended with good success in an obstinate costiveness, &c. 3. *Fat things*, for these also do both excellently smooth the sides of the Guts, and also hinder the hardness of the excrements, or take it away if it be there already: hence Butter, especially before meal, loosens the Belly, also oyl of sweet Almonds; not to mention, that these very fat things also themselves have Saline stimulating parts. 4. *Saline things*, whence Salt of Tartar loosens the Belly, also the tincture or Tartar, which upon this account is commended by *Hartman* for costiveness; whence these things are also put into Clysters: likewise some *acidula*, as crude Tartar, its cream and crystals, which excellently mollifie and cleanse: also somethings of a middle Nature, as common Salt; likewise in particular nitrous things, whence crude Nitre, &c. often notably loosens the Belly: hither belong nitrous plants, as Sugar, &c.

G. W. Wedel. de f. m. fac. 131.

IV. Those things perform *it per se* or of themselves, which sollicit Nature, though more gently, to expulsion; which indeed some of the Saline Remedies already mentioned do: but those do chiefly come under this rank, that have a Salino-sulphureous Acrimony, as not only Aloes in chief, but even all other purgers properly so called, being given in a lesser dose, are Lenitives.

Idem.

V. And these are convenient in any Disease: yet it is not necessary to use them in every Disease, and that in the first place, and before any thing else: but they may be used in every Disease, for in any one it is good to have the Belly open.

Idem.

VI. And there may be given with meat, both the alimentous, and also those that have no such great vertue to disturb the Humours and Stomach, but are kindly and Balsamick.

Idem.

VII. These help Purgers themselves, so that other things may fitly be boiled with prunes and Raisins.

Idem.

VIII. Lenitives indeed evacuate the ordure and first ways; but the Humours in the first ways do not only indicate Lenitives, but their resignation and stufing do altogether require also the stronger Purgers and such as are properly so called.

Idem.

IX. Sometimes lubricators and emollients are more convenient; other whiles the gently cleansing and stimulating: Those namely are better, where the Stomach is in good order, and there is driness in the Guts; These when the Natural Stimulus and expulsion of Nature is wanting: with those the Sto-

mach is not to be overcharged, for so its tone is easily hurt.

X. Amongst Lenitives *Night dew* is to be numbered, which falls in the summer time (nearest the Spring and Fall) upon any thing of a softer Nature, whether eatable or drinkable, medicinal or not: It is of that Nature as very well to loosen the Belly, as both experience testifies and authority confirms. *Hippocrates* who exposes purging potions to the open air (1. de m. m. n. 123. and often 1. de nat. mul. 2. 49. and 1. de int. aff. 21. and 38. and 3. de morbis) says very expressly, *You shall give all things to a man in a Fever, exposed to the air without doors for a night, except such whose Belly is too loose.* *Dioscorides* consents, who 2. c. 29. orders the eating of a Gudgeon that has in the night been laid without doors, to make the Belly soluble. *Archigenes* in *Galen* (9. K. T. c. 66.) approved of preparations of Medicines abroad in the air. *Oribasius* coll. 8. often when he propounds any thing solative, orders it first to be exposed without doors. Many commend the water distilled from collected dew, to provoke to stool: to wit because dew seems to be very detergent and extenuative, &c.

Severini. Chirurg. Trim. p. 18.

XI. A certain Melancholick person was very costive, so that sometimes he went not to stool in six or seven days; which inconvenience was Remedied by taking two hours before supper boild prunes with their decoction, to which was added half a glass of very watrish Wine, one half whereof he took before the prunes, and the other half after: by this means his Belly was very well loosened, and far more effectually than it uses to be by prunes alone.

Ligatures.

The Contents.

They are rather hurtful than profitable in stanching of Blood.

I.

The way of using them according to Hippocrates. II.

They act not by attraction. III.

I. Most use Ligatures in the cure of an hemorrhagie, spitting of Blood, &c. But they are not well approved of though proposed by *Galen* (5. meth. 6.) for as soon as the Ligature is loosed, the Head is filled, or any other part wherein the Hemorrhagie is. For the Blood that was retained beyond the Ligature, as soon as the band is loosed, becoming unbridled slides into the weak part. Therefore *Oribasius*, *Aëtius* and *Avicen* use Ligatures to procure sleep, for no other reason than because the head is filled upon loosing the Ligature.

Saxoni. Prælect. pract. p. 4. c. 24.

II. *Hippocrates* (2. de morbis mul.) commands to lay unwash'd wool as a Bolster under Ligatures that are made for revulsion; that the Ligature may indeed bind straitly, but the pain from the constriction may be prevented. For we use Ligatures with a double intent, 1. That by the pain which they cause, either the benumbed or drowsie faculty may be excited; or that revulsion may be made from the affected to the tyed part. But sometimes we use them to stop a flux of Blood, and then we must see that the band be fast, for so the flux is stopped; but pain is to be avoided as much as may be, whereby the Patients that are debilitated by the flux of Blood, might be hurt. For this end therefore he lays soft wool under the Ligatures, which is a profitable artifice of *Hippocrates* which none that I know of has hitherto made use of.

P. Marriani comm. in v. 32. loc. cit.

III. It

III. It is manifest that painful Ligatures attract, because the part that is intercepted by the Ligature swells, so that it is even inflamed by the plenty of the Blood that rushes towards it, and unless it be loosed, a gangrene may come upon it. 2. It is demonstrated by the Ligature that is in order to Blood-letting: If the neck be tyed with a fillet, the veins of the Head swell; for the pain of the Ligature is believed to draw to the Head. The manner of attraction is ascribed to pain, heat and *fuga vacui* (or the avoiding vacuity) To pain indeed, as it depends upon its causes, an hot *intemperies* and a solution of continuity springing thence; this debilitates the part and makes it unable to repel the Humours from it, whence the tyed part swells. But there is a far other reason of this swelling; Ligatures upon the Arms stop the motion of the Blood that is flowing out at the Nose, not because they attract upon the score of pain or heat, but because they retard the Blood, that is received from the Arteries and is a returning to the heart by the Veins, from passing so speedily to the right ventricle. On this foundation the vertue of Ligatures rests; whilst they are made upon a sound part, they hinder the Blood from flowing back by the Veins to the affected part in any plenty, & so the affected part is freed from the influx.

Narcoticks.

(See *Hypnoticks* before.)

Nephriticks, Cysticks, or Medicines for the Stone.

(See Book 3. *Calculus Renum*, or the Stone in the Kidneys, and Book 15. *Renum affectus*, or Diseases of the Kidneys.)

The Contents.

They respect either the resolution of the Coagulum in self; I.
Or the Saline Acrimony and irritation of the genus membranofum; II.
Or the opening of the ways; III.
Nephriticks and Cysticks are the same. IV.
Nephriticks are not to be confounded. V.
Resolvers hurt when a Saline Acrimony offends. VI.
The Reins rejoice in moisture, but not excessive. VII.
Where Topicks are to be applied. VIII.
Refrigerating ointments scarce cool because of the oyl. IX.
Hot dissolvers of the Stone many times do hurt. X.

I. IT being presupposed 1. that the Material cause of the Stone is a dry concretion, that in a Natural state is voided with the Urine, or a Tartareous Salt, consisting of an earthy and Saline matter, although a viscous Humour may also concur; 2. That the Blood of calculous persons (add of Gouty and Hypochondriacal) abounds with such Saline and Tartareous Coagulables; we say that Nephritick Medicines are both such as resolve, and such as mitigate, and such as drive forward; and so they respect 1. the resolution of the coagulum in self, or the slimness or muddiness of the Blood tending now out of the Vessels, separated in the Kidneys and Bladder but not expelled, whether it offend by its

plenty, or Nature her self fail in her expulsion; and the earthy parts by the access of the saline fixed & volatile turn into a coagulum, such as are 1. *Alstergers*, both watry and diluting, that afford a more plentiful Serum for the draining out of those excrements, and are good against gravel when there is a plentiful sediment in the Urine and the stone is a breeding. 2. *Sulphureous Resolvers*, that more intimately hinder coagulation, and hinder the matter from stopping there, whether they be more temperate, oily, obtruding and taking away Acrimony, of *Sperma ceti* and other Aperiens, that are good in any obstructions, stoppage of Urine, stone, &c. or more active, fusing the Blood as it were, and precipitating and liquating the Serum into the Kidneys, such as are chiefly Remedies of Turpentine which give the Urine a Violet smell, which is a notable testimony that their vertue reaches hither, the oyl of Amber, &c. 3. *Saline Resolvers*, whether Acid, inciding and detaching, as *Acidum Tartari*, acid mineral Spirits, especially Spirit of Salt, or soapy, and earthy alkalis, & obforbing Lyes, which are of avail either through their Salt which they keep retir'd, or from their notable vertue of absorbing saline Humours, as Crabs-eyes, the Salts of plants, the tincture of Tartar, &c. whence belong hither most of the more generous Aperiens Diureticks, and Lithontripicks. From hence it appears why Acid and Lixivious Medicines also are good in the stone, namely both of them resolve, correct glutinosity, and destroy a preternatural coagulum; likewise other things that take away grumescence or clodding, and resolve coagulation, which also are good when clods of Blood stop about the Bladder.

II. Or 2. they respect the saline acrimony and irritation of the genus Membranofum, and are temperating, moistening, cooling, absorbing, whether the parenchyma and Membranous and Nervous passages be hurt by an acrimonious caustick Salt, as it is common upon taking *Cantharides*, to have all the harm accrew to the Kidneys and Bladder alone, or from the weight and sharp corners of the coagulated Stone: Such are 1. those things that are common as it were to both, temperate and demulcing aqueous Remedies, not Saline, Sweet and Mucilaginous, as Gum Tragacanth, Gum Arabick, the pulp of Cherries and Cassia, Raisins, Sebestiens, Conserve of the flowers of Mallows commended by *Amatus Fernelius's* Syrup of Marsh-Mallows, &c. 2. Things also that are partly oily and watry, as sweet Milk, Emulsions of the cold Seeds, which as they ease the Symptoms that are caused by *Cantharides*, so they do in a special manner demulce and ease the ways that are torn by over stretching as it were, and by accident they cure nocturnal pollution, help the Strangury that springs from a serous acrimony. 3. *Precipitants*, whether they be withal Stypticks, as in pissing of Blood and other laxities; or Nervine, as Cinnabarines, the more temperate specifick powders; so also steel Remedies belong hither: hence *Hernius* upon *Hippocrates's* aphor. 6. 6. where when he had said that the pains, and Diseases of the Reins and Bladder in general are hard to cure, he commends experimentally in an Ulcer of the Kidneys the juice of steel, that is steel Wine, made of the filings of steel macerated in sweet and strong Wine. 4. *Acids* correct a bilious Acrimony, if it be present, as red Liver-wort; whence according to *Hippocrates* (*lib. de locis*) *Acids* both cause the Strangury and help it: And these, as we have already intimated, are good for Bloody Urine, diabetes, nocturnal pollution, heat of Urine, yea in the stone it self; and we must also have great regard to the pains, which are as it were the tyrants of indication. 5. Hither belong even *Opiats* also, which being mixed with resolvers are very useful in the Stone, not indeed as if they resolved primarily, or as if they cleared the wayes, but because they give rest to Nature.

III. Or

III. Or 3. They respect the *stopping and clearing* of the ways, not so much by driving forward as loosning; that way and leave may be given to the departure of the unwelcome Guest, such as are internal and external *emollients* and *purgatives*, lubricators and moisteners, especially oily things, chiefly Oil of sweet Almonds, likewise Chamomel, the Decoction whereof resolves withal; whence the Flowers thereof in Pottage give present ease in the *Cardialgia* or Pain at the Stomach, the Colick, Stone; also fat Broths; for they give by so much the present Ease, by how much they resolve the more withal; thus the Oil of sweet Almonds with the juice of Lemons is a Secret with some. Hitherto belongs that place of *Walaw*, (*m. m. p. 4.*) In Pains of the Stone, says he, whether you Purge or Bleed, you do nothing; but if Turpentine be given with Manna and the Oil of sweet Almonds, the Business is done. So externally also mollifying and resolving bags are profitable, (not omitting distilled things that have a penetrating virtue) likewise Ointments, Pultesses, Clysters, Baths.

IV. But those are over-nice and multiply Entities without necessity, who treat of Nephriticks and Cysticks severally, for there are the same causes of the Stone both in the Kidneys and bladder, therefore the Remedies will also be the same. Note therefore that while we alter the Reins, and apply Remedies to them, the Bladder is always to be respected at the same time, and on the contrary, lest while we would benefit the one, we hurt the other, which is to be observed chiefly in active Alteratives; for they may be also affected severally, as the Bladder with a *Scabies*, and the Reins with Ulcers, &c.

V. Nephriticks are not to be confounded; we must not drive forward where we would resolve, or mitigate; nor must we mitigate where we would resolve. Both Empiricks and the Patients themselves erre often in this, when they endeavour to drive out the Enemy (*simul & semel*) all at once as it were by stronger expellers; by which preposterous purpose, when, for instance, they give Balsam of Sulphur, Oil of Juniper, Turpentine, &c. alone, they have for their Pains a bloody Urine or Ischury. But expellers have then chiefly no place, when the Stone sticks in those parts out of which it cannot be expelled without hurt; as when it fixes in the Ureters: whence it is better to use Resolvers, yea Mitigators withal, whereby Nature being strengthened attempts the Expulsion of the troublesome matter, and drives it forth.

VI. Note that when a Saline acrimony bears sway, all Resolvers are in vain as it were, whence all acid and acrimonious things are to be avoided, yea Wine it self: So provokers of Urine are not good in the pain of the Stone in the Kidneys, or when they are ulcered, or in pissing of Blood, or the *Diabetes*; for in these cases only mitigators, temperaters and strengtheners are better; not omitting yet in Ulcers mild Abstergers and the more temperate Terebinthines, for instance, those that are reduced to drincks.

VII. Yea the Kidneys rejoice in moisture, but not excessive; hence also all hotter things are to be shunned, which being apt to consume the more ferous Parts and leave the thicker, do make the slimy substance more compact, so that a Stone is the more easily bred: moreover they are not to be loaded with too much drink, or a great deal of over-moist things, for when they fail in their office, a Dropie is apt to arise. ¶ Let the Patient never sit in a very hot Bath, nor stay in it above half an hour; for through an error here, the Kidneys easily inflame and Gangrene, which about a year ago happen'd to a Person of condition at Lucern.

VIII. The Topicks for the Kidneys are applied

to the Loins, those for the Bladder, to the *Rubet* and Navel; those for the Ureters, to the sides of the *hypogastrium*: Chiefly in stimulating of the Urine we have observed that distilled Oils are profitably applied to the Navel, because of the content through the Umbilical Vessels.

IX. But heating Topicks are more used than cooling, such namely as have place (for instance) in the *Diabetes* of Plantain and other things. For this Paradox is greatly to be noted; that we must never trust to cooling Ointments, to wit, to such as (for instance) are used for nocturnal pollution; of Galen's refrigerating Ointment, Mesue's Ointment of Roses, the Oil of Henbane, &c. for Oils are G. W. Wedel del. de f. m. fac. p. 112. hot in their own nature, and loosen more than they bind.

X. Out of the Fit of the Stone the accretion of the Tartar is to be prevented, and the increase of the Stones: which is not done by the hotter Lithontripticks, be they never so much commended; yea the production of Stones is promoted by these Medicines, and I have known the Disease made incurable by them.

Ophthalmicks, or Remedies for the Eyes.

(See Oculorum affectus; or the Diseases of the Eyes in general, Book XIV.)

The Contents.

They either respect the Eye it self; I.
Or the impure Humours; II.
Or the defect of the Humours; III.
Or the Spirits and Nerves. IV.
Suppuratives are hurtful in Diseases of the Eyes. V.
Opiats are to be used warily. VI.
They endure mucilaginous things, but not clammey. VII.

I. Ophthalmicks, as to the manner of operation, respect either 1. The Eye it self, whether as to the *tunica adnata* inflamed, as in an Ophthalmie; or as to the *cornea*, not letting in the visible Species, dusky, ulcered, wounded; such as are both *Repellents* and *Abstergers*, whether somewhat acrimonious, as fat things, of which the principal is the fat of Vipers, Rue, white Vitriol, &c. or watry, as distilled waters; or earthy, as Perles prepared, &c. which besides that they are good in an Ophthalmie or Inflammation of the Eye; as waters are, profit also in Pustules, Excrescences, and in things that grow to the *tunica cornea*, in Haws, Ulcers and most other Distempers that occur to the Eye.

II. Or 2. They respect the impure Humours, vapours, and halitus, both inwardly and outwardly, such as are discussers, whether Internal, most of which are Cephalicks, or External; whether the Distemper have arisen principally from an internal cause, such as are good in a suffusion and weakness of Sight, and procure a due consistence to the Humours; or from an external, as from chafing or a stroak.

III. Or 3. They restore the failing Spirits; so *Burhus* has cryed up Celandine water, *Heer* the juice of Elm-bladders presently dropt into the wounded Eye. These are good moreover on this account in Scars, Haws, Ulcers, straitness of the *Pupilla*, Poreblindness, Mopeyness, depravation of Sight.

IV. Or lastly, They respect the Spirits and Nerves, both such as open and unlock these, and also such as comfort and restore them, internal and external, which are of use in the *gutta serena*; weakness of Sight from bruises, stroaks and internal fault, the Palsie, &c. And these scarce differ from Cephalicks especially

Wedel.

Wepfer. con.
fil. mt. de
Nephrit.

especially those of thinner Parts; and Severinus commends volatils themselves, as the volatil Salt of Vipers, in that case outwardly. The rest, as Astringents, Traumaticks, &c. are common, as also revulsiory, as blisters.

V. Suppuraters are to be avoided by any means, whence neither are Emollients indifferently convenient: I have seen a great Inflammation of the Eyes turn to Suppuration even of it self.

VI. Oils are to be used warily, not because they take away the sense of the Part, but for their acrimony, and because they put the Spirits to flight.

VII. The Eyes delight in maciliginous things, but not so in clammy; because these stir up Pain, but those being conformable in their temperament, demulce, defend, alter.

Preparers of the Humours.

(See Aprients and Alterative.)

The Contents.

Whether they be always necessary before Purging, and what kind of Preparation is requisite. I.
When Nature is oppressed by Humours offending both in quantity and quality, how to be made. II.
As the Crudity of the Humours depends on their disgregation, so their Concoction is to be expected from Temperature and Union. III.
Things that are thick from adustion are otherwise to be prepared than those that are thick from crudity. IV.
Preparation may and ought to be made by outward Applications. V.
Whether and what Humours are to be altered. VI.
They may be given at anytime. VII.
How thick Humours are to be prepared. VIII.
Whether thin need Preparation. IX.
When the Alteratives ought to be as strong as the quality to be altered. X.
Let alterations be made by degrees. XI.
Let there be an Analogy between the alterative and thing to be altered. XII.
Concoction is not to be interrupted by the giving of looseners. XIII.
Whether the bilious Humour be always to be prepared by cold things. XIV.
The abuse and hurt of Apozems. XV.
Barley water is not to be put in Apozems. XVI.
When Laxatives are hurtful. XVII.
Before Purging let the Body be made soluble rather by a Clyster than Syrups. XVIII.
With these, Strengtheners are to be administered. XIX.
Infusions are better than Decoctions. XX.
All distilled Waters are naught for the Stomach. XXI.
Chymical Openers are to be preferred before Galenick. XXII.
Aliments that one is used to, will not supply the place of Medicines. XXIII.
Whether the Spirit and Oil of Vitriol be good in Fevers. XXIV.
The Medicines of Tartar are not universal Digestives. XXV.
When the crystals of Tartar, and when the cream to be given. XXVI.
The deceit in making of the Crystals. XXVII.
There is often more vertue in crude Tartar than in its Cream. XXVIII.
The efficacy of the Salt of Tartar. XXIX.
The correction of Tartar vitriolate. XXX.
To whom that and other Preparations of Tartar are hurtful. XXXI.
Whence the efficacy of volatil Salts depends. XXXII.
They very well prepare tough Phlegm. XXXIII.
The glutinousness of choler is excellently corrected by their means. XXXIV. and XLV.

The efficacy and correction of the Salt or Vitriol of Steel. XXXIV.

Steel is diversly to be prepared according to the nature of the obstructing Humour. XXXV.

How to draw out of it its several vertues, of binding, opening, purging and vomiting. XXXVI.

How the action of Chalybeates is to be promoted. XXXVII.

Whether Purgers may be given with them. XXXVIII.

Whether Cordials. XXXIX.

Cautions in the use of Chalybeates. XL.

How Nitre cools. XLI.

Oxymels and Hydromels are better than Syrups. XLII.

Dried herbs have other vertues than green. XLIII.

In the correcting of Phlegm Sugar and Medicines prepared with Sugar do hurt. XLIV.

An hurtful abuse of Wormwood. XLV.

When to be used for the concoction of the Humours, and the strengthening of the Stomach. XLVI.

Some Preparers are universal, others particular. XLVII.

How Choler is to be prepared. XLVIII. and XLIX.

The correcting of Salt Phlegm and Serum. XLIX.

How a melancholick cacochymie is to be corrected. L.

How atrabiliary Humours. LI.

The Correction of acrimonious Humours is various according to their difference. LII.

We must take heed lest in altering one Humour, the rest be injured thereby. LIII.

How to bridle the too great effervescence in the small guts and heart. LIV.

The Pancreatick Humour is to be prepared before evacuation. LV.

How to correct the too great fluidity, or the over thick consistence of the Blood. LVI.

I. The more Ancient Physicians, to whom many of the Moderns also assent, as they believed an elective Purgation, so they ordered a Preparation of the Humours previous and as it were necessary to it: on which account in Books of Practice, as often as a Cathartick Medicine is prescribed, a long series of Preparers destin'd for every particular Humour, is proposed in a solemn manner and with a certain pomp as it were: whose use although it be very specious, seems not at all profitable; because such Humours are not truly in being, as we have elsewhere clearly shewn. Notwithstanding seeing Purging is not convenient at all times, nor in every condition of the Body, to perform it right, both a fit time and some sort of preparation is requisite: and both these respect as well the first ways, as the mass of Blood. As to the former, if at any time the Stomach be either burthened with a load of viscous Phlegm, or be troubled with the effusion of turbid bile, Purging is often undertaken to none or ill purpose, unless these contents be either first swept out by giving a Vomit, or their burthening and effervescence be corrected by Digestives. And as to the latter, viz. the Blood, Purging is often unreasonable, and sometimes also incongruous, and in neither of these cases are those which are commonly called Preparers, but only Alteratives, convenient; because those imaginary Humours are not to be disposed towards evacuation, but the Blood itself ought to be reduced either from a troubled and confused to a sedate state, or from a weakness or dyscrasie to a vigour and equable temperament. When the Blood effusing from a Fever is disturbed in its mixture, Purging is always found hurtful, and therefore it is condemned by Hippocrates and the Ancients: and no less when its mass being languid and weak, rises not to a due Fermentation. Moreover when the Blood is beyond measure chole- rick, or watry, or is too much inclined to coagulations or fusions, Purgers are for the most part so far from removing such faults or depravation, that they oftener increase them. So that in these cases altering Remedies are rather indicated, those namely that may destroy the undue separations, or combinations of the Salts, Sulphur and Serum, and take away their other enormities.

II. Sometimes Nature is over-whelmed and choaked by the plenty of Humours; sometimes she is only pricked and irritated by their quality; or both of these happens, viz. that both the plenty of Humours, and also their hurtful quality oppresses Nature. Thus if together with a very great febrile effervescence the Patient feel wandering Pains in divers Parts, and also suffer divers changes of heat in his Face and other parts, so that one while some part of his face look red, and anon pale, and lastly be very restless, and ill at ease; which depends on the ferrous Humour irritated with a febrile Ferment; besides Bleeding and Purging, the cure must be begun with specifick antifebriles, and temperate Antiarthriticks, Diaphoreticks and Diureticks, which may, like Nature, precipitate the matter that infects by its quality: And at length when the Symptoms are allayed, the occasional cause is to be eradicated by Purging, and a relapse to be prevented.

Frid. Hof-
man m. m.
l. 1. s. 7.

III. Every alteration makes not the Humours crude, but only that, (if we consult Hippocrates) which is apt to cause a disgregation in them: for disgregation alone is thought to be the immediate cause of the Humours becoming crude. For whereas they may offend three manner of ways (as Hippocrates teacheth, *l. de N. h. v. 60.*) in Quantity, in Quality, and because they are disgregated from one another; neither a fault in quantity alone, nor a simple alteration as to quality are apt of themselves to breed crudity, for neither of them is corrected by concoction: for if the Humours exceed, or come short in quantity, we must only remedy it by evacuation, or repletion; for the Diseases that repletion causes, emptying cures, and on the contrary, according to Hippocrates. So neither does their fault as to quality make them crude, because, as Hippocrates says (*l. de v. Med.*) All these are thus cured, that those who are affected with coldness be heated, and those that are affected with heat be cooled; and these things are soon obtained, for there is no need of concoction. Seeing therefore neither a fault in the quantity, nor the quality can of it self introduce crudity upon the Humours, it is necessary to affirm that the Humours contract crudity only because they are disgregated or sever'd from one another. Wherefore, because Concoction is opposed to crudity, Hippocrates describing Concoction hath affirmed (*l. cit. de vet. Med.*) that it is wrought by a mutual permixtion and temperature, as it were by boiling. Now by Disgregation of the Humours we understand, not an exact separation of one from another, so that they occupy divers places, but a dissolution of that mixture by means whereof they are corrected and contempered to one another, and when it is dissolved, every one acts according to its proper virtues and qualities. By the means therefore of this disgregation is a Crudity introduced upon the Humours, which while they are reduced to their former Union and Concord, are said to be concocted. From which we may collect that not all Diseases, that depend on the abundance or alteration of the Humours, shew signs of crudity or concoction, but only those wherein is the aforesaid Disgregation: And this, Hippocrates (*l. de vet. Med.*) would intimate to us, whilst reckoning up the Diseases that are cured by concoction, he only enumerates Fevers, Tubercles or Tumours, and Detillations: for these Diseases do necessarily presuppose a Disgregation of Humours. Therefore Concoction is in vain to be expected in those Diseases wherein, seeing the Humours were never crude, they are in like manner unconcoctible; and far less in the Humours of the healthful, whom we intend to Purge for prevention: for in these, only the width of the ways is attended to; which Hippocrates meant (*in Aph.*) When Bodies are to be Purged, they must be made fluid. Reducing which Precept to Practice, he uses before Purging, both drinking more largely

and bathing, or fomenting all the Body over; this latter chiefly before he would Purge downward, and the former, when he would Vomit. ¶ Whereas there may be many causes of Disgregation, I find them all reduced to three heads in the Doctrine of Hippocrates 1. When any Humor is so much increased in the Body, that it far exceeds the rest in plenty; 2. The second cause is motion, or perturbation and agitation; 3. A notable alteration as to the first qualities chiefly. Now that the Humours may be disgregated through the excess of one of them as to quantity, is consonant to reason, so that it refuseth to be associated and contempered to the rest, as excellency of them. Hippocrates shews us this cause of disgregation *l. de insomn. v. 31.* For by some repletion, says he, made within, there happens a certain secretion that disturbs the Soul: where by secretion he understands not any evacuation, but the aforesaid disgregation. But concerning the causes thereof we must note; that these sometimes cause a Disease of themselves and primarily without disgregation, sometimes by its means, otherwise there would only be one cause of Diseases. The first cause therefore is the excess of any Humor in quantity. And that the Humours are disgregated through motion (which is the second cause) Hippocrates teacheth (*4. de morb.*) by the example of Milk, by the agitation whereof the Butter, Whey and Cheese are separated. And lastly, that an alteration as to qualities makes the same disgregation, is shewn also by the example of Milk, which is conglobated (or curdled) upon pouring Liquor into it, not by coldness alone, as Hippocrates would, but by any great alteration that may proceed to corruption of substance: thus Milk is curdled with excess of heat, without Runnet. When therefore the Humours are so altered as to their proper qualities, that the alteration tends to the destruction of the substance (this is said to difference it from simple alteration, whereby the Humours are not removed from their natural state) their natural union is dissolved, and they are disgregated from one another; so that although every one remain in the same place, yet each is rendred intemperate as to its proper nature.

Franc. de le Boë Sylvius seeks the causes of Crudity and Concoction in a looser or stricter union of the excrementitious Humours with the Blood. He says (*Prax. l. 1. c. 55. §. 16.*) Physicians mean the Crudity and Concoction of the Humours that constitute the Mass of Blood and are mixt with it, when they treat of them in the Examination and Cure of Diseases, especially the acute; and when they so greatly and deservedly desire the concoction of the Humours; that the Cure may succeed according to wish: for as often as the Blood is infected and evil affected immediately, or by intermediate Humours contained in the Body without the Mass of Blood, viz. choler, the Pancreatick juice, Lympha and Phlegm, so often the vital effervescence that is peculiar to it, is altered & vitiated likewise, and that so, as that presently more or less there is a disturbance of that natural and loose confusion between the Blood & those Humours that flow continually with it to the Heart, whether they be then joined to it more faintly and intimately, or more loosely and less intimately. Now when the other Humours are joynd to the Blood more intimately and strictly than usual, then a more watry Urine is made, and such as has less tincture and other contents, and this they call Crude, that is, a sign of crudity: But after that the Urine by degrees becomes more tinged and brings more contents with it, it is commended and is called concocted, namely signifying that concoction is more or less begun or promoted: which comes to pass as often as the aforesaid humours, as excrementitious and before too strictly and intimately united to the Blood, are by degrees separated from it again, and are partly expelled

Idem l. de
Nat. hum.
v. 272.

expelled together with the Urine; which is good and profitable for a man, as the other was bad and hurtful: for according to Nature and in an healthful State, the Urine has something at least of a Yellowish tincture: but no content is found in it, unless some error be committed in Diet, or a mans constitution decline more or less from a perfect State of Health. Now if any one do attentively consider all the Humours in the Body that are to be confounded with the Blood, as also the proper qualities of each, he will easily come over to us, and will grant that their stricter union with the Blood is owing to an Acid, and therefore to the Pancreatick juice or *Lympha* ill affected: On the contrary, that their looser Union with the Blood, and so the loosning of the Stricter, is to be hoped and expected from a *sal lixivium* and especially a Volatil, and so from a bitter, and therefore from Choler when it is more powerful and has the dominion. Daily experience confirms how true these things are which I have now said, seeing it may be known to any who observes those things which cast the Healthful into divers Sicknesses, and increase the same, and on the other hand which restore lost health to sick Persons, that the concoction in the Blood is hindered by the Vertue of Acids, but such as are excessively so: and that the same is promoted and obtain'd by the help of Aromaticks, and in particular of bitter things, or volatil Salts, but such as are more temperate. (See concerning the signs of crudity from Urines, loc. cit. § 14.) The watry Urine, which is a sign of crudity, that is, of deficient concoction in the Humours of the Blood, as often as it continues and a Spontaneous concoction by Nature is expected in vain, so often is it to be promoted by Art, and that by Medicines that kindly temper all acrimony of the Humours, but chiefly the acid (whence the too intimate mixture of the Humours in the mass of Blood uses to proceed) and such as will loose again their over strict union. The fixed Sulphurs of Minerals and Metals being exalted to their greatest Perfection, do above all other things gently temper all acrimony of the Humours, even the acid also: Next to these are volatil oleous Salts, and to these, Aromaticks, by the vertue of which being prudently used, exceeding even imagination in many things, there is not only obtained such an effervescence of subcontrary Humours in the small Gut and Heart, as is most agreeable to Humane Nature, but the preternatural concretion and union of the two acrimonious Humours, being first moderated by them, is dissolved again in the Blood. I declare from Experience that these things are to be esteemed of great moment in Physick. Idem § 78. and 79.

IV. *Trallianus* (L. 5. cap. concerning a Diarrhoea from obstructions) does not grant oxymel for preparing the Humours that are thick through adustion, but that are thick through crudity. For the things that are thick through adustion, are made thin if you dilute them with liquids; thus dirt is made thin by mixing it with water, and choler made Vitelline (or like the yolks of Eggs) by assation, by a cold and moist Portion becomes thin and liquid: but the things that are thick through crudity, or the admixture of a thick Humour, such as is vitelline choler in a bad Tertian, are made thin by heating things, that attenuate the thickness of the substance, and incide the channels; thus we incide and attenuate vitelline and thick Phlegm by Oxymel and Honey of Roses.

Wal. m. m.
P. 94.

V. When the whole mass of Blood offends in quality, we may change it also with external Alteratives, Epithems and washings of the hands witness this.

VI. There are some Practitioners that always alter and never Purge: That we may know whether Alteration ought to be made, we lay down these Rules: 1. All alimentary Humours ought to be

alter'd when they abound: 2. And the excrementitious Humours (1) which are so mixed with the mass of Blood, that they cannot be separated; (2) In burning Fevers, in the greatest heat and motion of the Blood, the vicious Particles are so exactly mixed with the good Blood, that they admit of no separation: whence it is absurd to intend to Purge in the augment or state of these Fevers: (3) When excrementitious Humours so abound, that they cannot be drawn out without present danger of life. 3. Those excrementitious Humours refuse alteration that are severed from the mass of Blood. Idem p. 102.

VII. Let none trouble himself in vain with thinking as many do, (who are moved more by Reason than Experience) that all Medicines can be taken safely only when the Stomach is empty of Meat, seeing I have found the contrary true in many, especially as to Medicines that alter and correct the Humors: For I have observed a thousand times that Alteratives, namely the gentle, for such only I would have Physicians to use, have been used with greater benefit of the Patient, a little before or after Meals, yea at them, than at other times. Nor is reason contrary to this experience, for so the vertue of the Medicine does kindly mix and insinuate it self not only into the *Saliva* in the Stomach, but also into the Ternary of Humours that flow together in the small Gut, yea into all the Blood also and all the other Humours in the right ventricle of the Heart, and in all the Arteries and Veins: whereby the desired amendment and correction of one or all of them is the sooner, more easily and happily performed. Franc. Sylv. Pract. l. 1. c. 34. § 102.

VIII. Thick Humours cannot flow, and they are either tough, or slimy, or dense: The sliminess of the Humours is known from the Urine, when some white stuff sticks closely to the Chamber Pot. The thickness of the Humours is corrected by acid and hot things: whence in many Fevers all we give is to no purpose, unless we mix hot things therewith: Yea it may chance, that when a Physician has not been able to cure a long Tertian, prescribing to his Patient nothing but tedious cooling Apozems; an old Woman coming bids him take a draught of Wine to comfort himself, and the Patient is recovered. Walaeus m. m. p. 104.

IX. Preparation is always necessary before purging except in two cases: 1. if the matter be turgid; 2. if it be thin, such as is the cholerick and serous, which easily yield to any attracting Remedy. But it is questioned, whether thin Humors be to be prepared, that is, incrassated: for the Humours cannot be evacuated unless they be concocted, but concoction incrassates, as Aristotle 4. met. teacheth. Concoction, says Avicenna, is a certain ad-equection and reduction to mediocrity: if therefore thin Humours be to be concocted, they are to be reduced to mediocrity, and therefore to be incrassated. Besides, thin Humours easily elude the vertue of the Medicine, which working by compressing the Vessels, thin Humours will be apt to escape. But on the contrary thinness of the Humours is requisite for evacuation; for thin Humours pass out of their own accord and resist not attracting Medicines, as Galen teacheth, 3. progn. 23. and in other places. We must say that to a due purgation three things are required, 1. An effectual Medicine given in a due dose, time and manner. 2. The ways ought to be open, otherwise there is either no purgation, or such as is troublesome. 3. The Humour ought to be disposed, and it is so if it make no resistance against the Medicine, as if it be not tough, thick, clammy, or mixt with the Blood, or other Humours whereby its motion may be hindered. Therefore thin Humours are in their own Nature most easily purged out; but, they are mixt either with the Blood or other Humours; or the ways may be shut and obstructed: wherefore these

are

are to be opened; and then the Humours to be evacuated are to be separated from the rest. Now concoction is twofold: one wherein the Humours are reduced to benignity, that they may nourish; the other wherein they are made apt for expulsion. If we speak of the first, we must concoct thin Humours that they may return to mediocrity, therefore they are to be incrassated: If of the second, thick Humours are rather to be attenuated, because they resist that which would move them, but not the thin, because they are easily moveable, as *Galen* in the fore-cited place teacheth. But if thin Humours be mixed with the Blood, they ought first to be prepared: and whether they be so, is known 1. by the Blood that is let, if much ichor separate from it; 2. When these Humours are separated, there ensue Itchings, Blains and Scabs; 3. If the Urine be ruddy and thick, it is a sign that thin Humours are mixt with the Blood: but if it be plentiful, thin and clear, it is a sign they are separated and prepared.

XI. Whether ought an altering Medicine in one dose be so strong, as the quality that it should change in the Body? I answer, if it can reach the part affected, and that without the hurt or prejudice of the adjoining parts, then it is altogether lawful: so a beginning *Erysipelas*, that has seized but upon one part, may be presently expelled by a strong cooler, and the heat of the Stomach likewise: But if it cannot conveniently reach to the part affected without having its virtue weakened, and without the hurting also of the neighbouring parts, we must alter by giving the Medicine at several times.

XII. Let Alterations be made leisurely, so as not to begin at the highest degree, that is, the third: sometimes we alter in the fourth: But let us begin at the first, and proceed from the first to the second; from the second to the third, if the two first will not doe: otherwise the highest degree would easily become familiar to Nature, and afterwards she would not be helped by weaker things.

XIII. We cannot alter every thing with every Alterative, for alteration is made by conjunction and perfection: hence if Medicines be to alter 'tis necessary that they be mixed with the Humours to be altered, if they require to be mixed: they ought to be like to the Humours, not in respect of qualities, for so they ought to be contrary, but in respect of the constitution. Therefore let those things that are oily in our Bodies, be altered with oleous things; the watry with watry; the Salt with Salt: Nor need we add hot things to hot, if we say that Salt things are to be added to Salt, for there are Salt things which are cold, such as Nitre and Borax.

XIII. During concoction, retentions of the excrements are profitable, and evacuations hurtful, as being contrary to concoctions. Wherefore we must than their practice who by continually soliciting evacuations by Clysters and other Remedies, give no leave for concoction.

XIV. The bilious Humour requires cold preparers: yet these do so hinder purgation, that we must sometimes abstain from them, especially just before it is time to purge. On which account even in cholerick and acute Diseases, we must seek for an opportunity to give hot Medicines, as the decoction of wild Majran, Penniroyal, &c. We shall therefore use cold syrups for the Acrimony of the Humours; but things that attenuate and incide when we would only make the Bodies fluid, to wit just before purging.

¶ *Choler*, both the natural excrementitious, and also the preternatural, and the excessive Sulphureous oleous parts of the Blood, in a word, a bilious cacochymie, as it offends by its heat, is digested by watry diluters, sharpish; and other temperate

things: but if it be too tough, also by inciders, and bitter things, as in the Jaundise; if too thin, by sharpish, and earthy mucilaginous things.

¶ *Choler* is to be temper'd both on the account of its Acrimony, and on the account of its volatility increased. The Saline lixivial Acrimony of the *Choler* is most powerfully temper'd by acid and sour things; more gently by oily and spirituous, which yet often it is not safe to use, seeing they are apt to increase and cherish the burning of the Bile and Blood, unless the *Acid* be first fixed. Therefore the only safe temperers of the Acrimony of *Choler* will be acid and sour things, such as are amongst vulgar Remedies, Sorrel, Wool-Sorrel, Plantain, &c. amongst Chymical I commend Alum and its Spirit, as also the Spirits of Vitriol, common Salt, Nitre, Sulphur, &c. distilled Vinegar, as well simple as prepared with other things. The too great volatility of the *Choler* may be diminished by fixers, and especially by the even now mentioned acid and sour things, amongst which the Spirit of Nitre is perhaps the principal, excelling all other acid Spirits in fixing.

XV. We must see that the unpleasantness of Apozems be not troublesome to Nature: for it often happens that the Remedy is ungrateful to Nature, and does more hurt by spoiling the appetite and overturning the Stomach, than good by the impression of its virtues: which neither does it bestow intire, seeing through its ungratefulness it suffers a repulse from Nature, and cannot be brought thither whither it was directed by the vehicle. Therefore the Ancients out of so great a multitude of Remedies, chose and brought into use a few that might allure Nature by their sweetness, and by their pleasantness might imprint their virtues more deeply, whilst they should be received into the more familiar embraces of Nature: for Nature refuses unpleasant things, as we may see in aliments. Moreover they are to be disallowed, when they are prepared besides the purpose for opening obstructions of the viscera (to which the cause of the Disease is not referred, but to the stoppage and conipation of the pores of the Skin) whence there is a retention of fuliginous excrements, which is followed by putrefaction. Add hereto, that whereas they chiefly provoke Urine (for of this virtue are the opening roots, therefore called diureticks; capillary herbs, the cold Seeds, &c.) they are unseasonably administered in the beginning and augment of a Fever (and they are given at no other time now a days) whereas Diureticks should never be administered in these, but when the matter is concocted and the Disease in its declination. Besides, it is ridiculous with so great labour and cost to prepare a Remedy that is unpleasant and of an uncertain effect, when we may with great security and freedom use with an ease boiling and light expences those things that have been approved by the Ancients and confirmed by the Moderns. Omitting those therefore let us use Mead, Oxymel, &c. Oxymel alone is commended as resisting putrefaction, attenuating thickness, exterging clamminess, penetrating to the Skin and not encreasing the Fever; nor will it rake the Guts or cause coughing, or affect the Nerves, if you lessen the Vinegar, and increase the Honey. In the Melancholick, and in Hysterical women, Mead is to be made use of; and if it seem to turn to choler, make it very dilute of the waters of Endive, Succory, &c. or instead of Honey, use Sugar, &c.

XVI. Those plainly doat that order a great quantity of Herbs, Roots, &c. to be boiled in the water of Barley thoroughly boiled: for a thorough Decoction of Barley is Pisan, and it has too solid a consistence to admit the consistence of so many things: And if you boil it more slightly, the water will be flatulent; and it will also make that promiscuous decoction soon apt to corrupt. ¶ *Mar-*

XVII. Those that in acute Diseases continue laxative Apozems, enervate the strength, and deviate quite from the true way of curing, which commands that at the beginning we should lessen the matter, afterwards incise the thick things that obstruct, and deterge the clammy and open the obstructions themselves.

Johan. Crato
Confil. 37.
apud Schol-
ezium.

XVIII. The Body will be soluble or slippery, if on the day before the Patient is to take an Infusion of Senna or other Purge, he take a Clyster of the Decoction of Fluellin mixed with Capon or Cock broth and a little Sugar added: this will do more good than if he weaken his Stomach for many dayes with Syrups.

XVIII. By the long use of Apozems that dissolve Phlegm, the Phlegm which plentifully stagnated in soft Bodies especially of Women and Cachectick Persons, is first attenuated, then dissolved into water, which descending by its weight fills the capacity of the lower Belly; which we see happen through the unwary giving of Purgers, whereby the Belly is so swelled that all think there is a Dropsie. Wherefore that Patients that are full of thick Phlegm may not incur this danger, let the Skilful Physician daily before he gives his Apozems premise a little of the troches of Wormwood, of Capers, of Maudlin, &c. That some have fallen into a Dropsie by Syrups that have been too inciding, is noted by Averroes 7. Collig. Henric. ab Heers Spadaer. cap. 10. Heurn. Meth. l. 3. c. 7. and l. 2. c. 17.

XIX. There is a new but wholesome way of infusing Herbs in Fevers, where there are great obstructions: for Infusions pass into the Veins more easily than either decoctions or distillations. Now this infusion is twofold, one when the Medicine is put into hot water, and the Vessel presently shut, and we set it upon warm ashes, to continue the warmth of the water; and then it is strongly strained out; the other is more ineffectual, when we put it into water that is not hot, and let it stand therein for a Night, &c.

Heurn. meth.
m. l. 1.

XX. All distilled waters are cold, even the water that is distilled from the hottest simple, as suppose from Calamint, which bites the Tongue like Pepper, and yet heats not but cools: And I have seen some that have been inflamed by drinking the decoction of the Indian wood, to be greatly cooled by Calamint water. ¶ As much as may be let us abstain from distilled waters as from those things that are very offensive to the Stomach.

Montan.

XXI. The Ancients gave tedious decoctions, long Infusions and Apozems: the Moderns consulting for the delicate, and curing per compendium, prefer before these, digestive powders of Magisteries, Sil's, Essences, and divers other preparations. Horstius (tom. 2. p. 193.) in the Hypochondriack Melancholy prescribes this for a digestive: Take of the Magistery of red Corals a scruple, of the Magistery of the Spongestone half a scruple, mix them; Give this in a decoction of Turnips with the rinds on, that through the bitterness of these the decoction may open, penetrate and incise the more powerfully.

Hoffm. Herc.
med. l. 3. c. 3.

¶ If any that is taught to understand more than the vulgar shall bend his mind to Chymical preparations, and more effectual Remedies, and therefore more safe, if so be they be rightly administered, we will commend to him both Tinctures and Extracts, and also oils prepared by art, likewise Volatil Salts, but chiefly oleous, to be got by art out of most parts of Animals, and convenient for use: Which being generally less ungrateful than the vulgar Medicines, and taken in a far less quantity, and operating more quickly and kindly, and also more effectually than they, are deservedly desired by the sick that are afflicted enough of themselves: so that it is unbecoming a Physician that would be esteemed compassionate, yea it is inhumane, not to be

willing to help, when he can, the infirmity, loathing and nausea of the Sick by a more grateful Medicine, but to chuse rather to be continually adding affliction to the afflicted. Wherefore I think the more kind are to be preferred before those surly Physicians, and a compliance is to be made both by the Physician and his Medicines to the natural infirmity, and sometimes peevishness of the Sick, &c.

Fr. Sylv.
Pract. l. 1.
c. 34. §. 103.

XXII. Those err, who for cooling Alteratives give those things that are very commonly eat, as Succory and Lettuce; I say they err, because Nature being used to them has contracted such a friendship and familiarity with them, that there is no strife betwixt them, and consequently no benefit to be expected. For some when they are well, will eat a whole Plate full of Lettuce or Succory every day, and therefore 'tis an idle thing to believe that Men who have for a long time been nourished by Lettuce and Succory, can be cooled by two or three leaves.

Sanctor.
meth. l. 4.
c. 13.

XXIII. J. B. Sylvaticus (Contr. 46.) rejects the use of the Spirit of Vitriol in Fevers, because it may coagulate the tender flesh, and prejudice the substance of the part by dissolving the primigenial moisture, 1. Because Galen and Dioscor. say that it partakes of a corroding and septic quality. I answer, In the preparation many parts of the Vitriol are separated from the Spirit, whence we cannot observe all the effects in the Spirit that are seen in the Vitriol intire; and some may be seen in the first that are not taken notice of in the latter. Vitriol vomits, the Spirit stays vomiting. So Sulphur is inflammable, its Spirit not so, yea it rather resisteth a flame. The Spirit of Vitriol hath an eroding faculty if given alone, but that is common to it with other Liquors, as Vinegar, the juice of Citron, &c. Your Acidule or Mineral Waters are drunk with profit, that have their vertue from Vitriolick Spirits: It is safely given in convenient Liquors. Its hotness is corrected, while its particles are severed by a mixture with Water or other Liquors, in that proportion, that an hundred particles or atoms of Water are mixed with ten or twelve of the Spirit. 2. The Medicine was not known to Antiquity; yea Galen suspects the use of Vitriolate waters in putrid Fevers, because being applied to the Skin, they both cause an asfriction of its pores, and too much heat the Body.

x. m. c. 2.
11. &c. 9.

Ans. We must not therefore reject it because it was not known to Antiquity. Galen disallows of the external use of Vitriolate Waters, because they constringe the Skin. 3. He says there are safer Medicines. Ans. The Spirit of Vitriol is safer if it be taken in a due quantity: That it has done good in Fevers, there are innumerable witnesses; few say that it has done hurt: It does not as yet appear that there are safer Medicines. 4. The too great asfriction that was in the Vitriol, is also in the oyl; now asfringents do harm in putrid Fevers. Ans. The asfriction in the Spirit is not so great as to do harm; there rather seems to be none in it: all acids do not asfringe; yea they attenuate, deterge, take away obstructions, loosen the Belly: it cures the flux of the Belly, not by binding, but by strengthening and condensing: there proceed indeed effects from densation, that are like to asfriction, but are not: asfringents and acids are different. But suppose it asfringe, there is no danger from thence, for the inciding, attenuating and opening parts are by far the more powerful. 5. Vitriol is poyson, according to Dioscorides. Ans. It is Poyson in a large sense, in which all things that kill by their quantity are called deleteries, &c. Rolsim. Ep. de febr. c. 136. where more objections are made. ¶ Spirit of Vitriol being given indecently and too long, puts on the nature rather of a Poyson than a Medicine: Being added to Humours that boil already enough of themselves, just

as

Rolfinc. conf.
a. l. 4. p.
405. as if you mix this Spirit with the Gall of some Animal, it causes greater disturbance, and procures a quicker ascent of vapours.

XXIV. Chymists make Universal and general Digestives of Tartar, as 1. Its cream and Crystals, 2. The magistery of Tartar vitriolate, 3. *Mistura simplex*: But these are not truly such, it is safer to rank them in the number of particular Digestives. They are not good in a bilious Cacoehymie, and for salt, sour and acrimonious humours: In those they may increase the ebullition and do harm. They are more profitable for a simple cacoehymical melancholy, but not so good for a Pontick and Acrimonious, which has the seeds of fire in it: As much as they avail to incide thickness, so much they irritate fervid and adust humours and hurt by inflaming. They are in some sort good for phlegmatic humors.

Rolfinc.
meth. gener.
Sec. p. 477.

XXV. The Cream and Crystal of Tartar absterge, incide thick and tartareous Humours, open obstructions and loosen the Belly; and either of them is a pleasant Medicine, if a drachm thereof be given in the broth of flesh, or in boyled water (with a little butter in it) with three, four or five grains of *Diagridium* or extract of Scammony; it will give the liquor a somewhat acid taste. The Crystals are not so acid nor so diuretick as the Cream, and therefore they are safer given when the body is not purged: the dose is from a scruple to a drachm.

Sennert. Epist.
28. cent. 1.

XXVI. As to the Crystal of Tartar, let the younger Physicians note, that it is of greater efficacy than is commonly believed, seeing we seldom make use of it in our practice through the carelessness of Apothecaries and deceit of Pseudochymists, or those common distillers that sell chymical Medicines to Apothecaries, none whereof almost is sincere, but all adulterate. The carelessness of Apothecaries is for the most part so great, that they chuse rather to buy the Crystal of Tartar of those distillers than make it themselves (though no preparation of Medicines in the whole art be easier) because it is sold them at a low price, whereas it would stand them dearer to make it. Now the cheat lies in this, that those Impostors put in their decoctions but a little Tartar and a great deal of Alum: not that Tartar is dearer than Alum, but because Tartar yields but a little quantity of Crystals, whereas Alum will all of it run into them. Hereby are Physicians disappointed of their end, seeing Alum is indued with an astringent vertue, that is contrary to the opening faculty that is desired by them. And another hurt is done this Medicine, that this sort of Crystals is drawn out by decoctions made in Brass pots, whereby the malignant quality of the Brass is imprinted upon the Medicine: For it is a very well known and vulgar precept of pharmacy, that acids be not boyled in brass vessels, because they easily penetrate, and draw a certain tincture from the brass that is very hurtful: But the Crystals of Tartar are very acid, and by some are named *Acidum Tartari*: And yet this error is very commonly committed even by the Apothecaries themselves; for almost all that make these Crystals with their own hands, use brass vessels; so that I have seen some Apothecaries have Crystals of Tartar of a Sea-green colour, from the Verdegrieze that had been drawn from the Vessel wherein they had been made. Therefore Physicians will consult for their own conscience, for their esteem and the health of their Patients, if they make Apothecaries make the crystal of Tartar with their own hand, and in Glass, Iron or earthen Vessels.

River. pract.
l. 11. c. 4.

XXVII. Though I leave every one to his own judgment and experience in the use of Tartar; yet by long use I have found that there is more of an opening and loosening faculty in Tartar itself than in its cream or crystals drawn by the solicitous

hands and thoughts of Chymists; seeing in boiling and by so many washings its purgative vertue that rests chiefly in its earthy and saline parts, does most of it vanish into the thin air. I prescribe opening herbs, that are destin'd for the Spleen or Liver to be boiled in portage, with the addition of a spoonful of white Tartar cleansed by washing only and dried.

Heest. obs. l.
de Mayenne.
Tr. de Arthre.

XXVIII. The Salt of Tartar has a great opening vertue, and may profitably be put in opening Apozems, Opiats and Pills: but its principal use is in a loosening Ptsan, which is made of two drachms of Senna infused in eight ounces of cold water, with a scruple or half a drachm of Salt of Tartar, whereby the Tincture of the Senna is powerfully extracted, so that this ptsan purgeth far more strongly than the common; and being continued for many days, looses all obstructions; from which effect I have known stubborn Quarrans often thoroughly cured by the use of this ptsan continued for fifteen days. If you fear the Acrimony of the Salt of Tartar, it may be corrected with the Spirit of Vitriol or Sulphur, as for half a drachm of the Salt let there be fifteen drops of the Spirit.

Bois. coll.
l. 1. c. 11.

River. Pract.

XXIX. Of the Spirit of Vitriol with the Salt or Spirit of Tartar is made *Tartar Vitriolate*, which incides and attenuates cold and viscous Humours, concocts crudities, opens obstructions and cleanseth away the sticking matter; and does all these things very effectually. For if the Tartar of Wine have of it self no small vertue to open and absterge; if Vitriol alone do this, as natural acid and vitriolate Waters demonstrate, which are very profitable in all Diseases that spring from obstructions; much more is this to be granted to Tartar vitriolate, where prepared and very well purified oyl of Tartar by pouring oyl of Vitriol drop by drop upon it, is fixt not without exandescence. But it is to be observed that if it be exactly prepared according to *Crollius*, it will create a nausea, and in the more delicate often cause a vomiting, through the over great quantity of the oyl of Tartar in respect to the Spirit of vitriol. Therefore it will have the better operation when equal parts are taken.

G. Hoff.
Dec. 9.
probl. 5.
where is another preparation.

XXX. The cream and crystals of Tartar and Tartar vitriolate are so common at this day, that many hardly prescribe any Medicines without putting some of these in them. Yea *Crollius* calls *Tartar Vitriolat* an universal Digestive. And I confess indeed that Medicines made of Tartar have a very great vertue in inciding and attenuating Melancholick and thick Humours, and therefore in opening obstructions. But whereas it often happens that in Hypochondriack Melancholy there are often found black choler and Salt and sour Humours, and such as are altogether Acrimonious and have the Seeds of fire as it were in them; surely Tartar Vitriolate and such Acrimonious Medicines are not proper for such Humours, seeing they do not blunt their Acrimony: but those are rather to be used which temper the bad qualities of such Humours, and contrary qualities are to be opposed to contrary. When sometimes there arise dreadful Symptoms from the use of Tartar vitriolate, as Vomiting, a pain at the Stomach, &c. it is not to be imputed to the Salt of Tartar, but often to the impure Spirit of Vitriol.

p. 610.

XXXI. Seeing volatil Salts may be drawn from all the parts of man with small trouble (whereof therefore I conclude they consist) none ought to wonder that amongst Alteratives and correctors of the depraved Humours of Men I often praise and commend *Volatil Salts*, but such as are mild, whereunto here also I deservedly give the preference in correcting and amending the hurts accrewing from the air any way infected, or from bad aliments that stay in the Body, &c.

XXXII. *Viscid Phlegm* is incised both by all Aromaticks and things that abound with a volatil Salt, and also by Acids, and most effectually by Aromatick Gums, as *Galbanum, Sagapenum, Ammoniacum, Bdelium, Opopanax, Mastich* and the like. ¶ Volatil Salts being taken for continuance, even together with meat, are good to prepare *tough Phlegm*, as not only incising and correcting of it, but driving part thereof to the ways of the urine and expelling of it in the form of sediment, which yet fails by degrees in the urine, and on that account yields an undoubted sign that the phlegm is corrected and overcome for the greatest part. ¶ Nothing does so incise and correct a too glutinous, rough and clammy Blood, as any volatil Salt, used for a continuance at any time at dinner and supper with Wine, &c. Seeing every Chronical and tedious distemper draws its original from a phlegmatick Humour, at least has the same joined with its cause, which yields to no Remedy more easily or sooner than to volatil Salt used according to art. ¶ Phlegm, as it is a concrete Serum, so it requires attenuaters, heaters, resolvers, or things that make it fluid with moisteners. But note that we must not dry too much, for so it becomes more concrete: whence besides Aromaticks and bitterish Acids, as Spirit of Vitriol, Phlegmaticks are very good, yet not omitting heaters and moisteners.

XXXIII. I have learned by some years experience that the consistence, and from hence the glutinousness of the Choler, as also of other Humours in the Body are increased by the frequent use of austere or sour things, and on the contrary that the same are lessened by a continued use of volatil Salts & Acrimonious Aromaticks.

XXXIV. The Salt or Vitriol of Steel gains the preference of all other Remedies, because it opens obstructions, strengthens the *Viscera*, and corrects an hot intemperies: the dose is from twelve grains to twenty with a Syrup or conserve, &c. The ungratefulness of its taste is amended by making it up into pills with the mucilage of Gum tragacanth. Let it be of constant use, and therefore prepare a great quantity. We give you here an easie preparation, that cannot be compared by *Beguin* and others: take of oyl of vitriol or Sulphur half a pound, of the Spirit of Wine a pound, pour them into a new and clean frying pan (or Iron dish) and cover it with a Board: within fifteen days there will be a saline concretion, which set in the sun, that it may be thoroughly dried, moving it now and then with an Iron spatula: in the winter it may be dried over a very weak fire, or in a stove: when the Salt is very well dried, put it up in a glass phial well stopp'd; for if it be expos'd to the air, it is apt to grow moist. The pills made of it with the mucilage of Gum tragacanth will be made harder by adding a little of the Powder of the Gum it self: and when they are made up, keep them in a glass, that they wax not moist. This Remedy may be continued for a month, or longer with great benefit.

XXXV. The vertue of Chalybeate Medicines depends on the different manner of resolving and laying open the particles of the concrete (or Steel) and of their being exerted into act. For steel or Iron consists chiefly of Salt, Sulphur and Earth; it is endued but very slenderly with Spirit and water: Now the particles of the former elements, especially the Sulphureous and saline, being combin'd in the concrete with the earthy, remain altogether fixt and sluggish; but being loos'd and pulled from one another, they are of very great efficacy. The foresaid particles are loos'd two ways, either by art, or by Nature, after they are taken into the body; for a metallick body is wont to be corroded and dissolved by the ferment of the Stomach, as by a Chymical Menstruum. The most simple way of preparing Iron (or Steel) is a dividing of its body into small integral parts

by filing, which parts retain the nature of the whole, and contain sulphureous and saline bodies combined with other earthy. The filing of Steel being taken inwardly, is dissolved by the ferment of the Stomach as by an acid Menstruum, the signs whereof are as well the sulphureous and nidorous belching, (like that when one has eaten Eggs boyld hard) as the blackness of the dung which is caused by the Steel dissolved within in the *Viscera*, that perform concoction: the active particles both sulphureous & saline fly plentifully out of the concrete, and benignly involved in the nutritious juice are conveyed into the Blood, which being of a contrary vertue, do often both of them as with joynt forces conspire for the profit of the sick. The sulphureous particles being conveyed into the Blood add to it a new and more plentiful store of Sulphur, so that its mass, if it was before poor and effete, does now ferment more briskly in the vessels, and being further kindled in the Heart acquires a more intense heat, yea and a deeper colour. For thus we may observe in very many that are affected with the *Leucophlegmatia* and Green-sickness, whose countenance is pale, their Blood cold and watry, that by the use of Steel they acquire a fresher and more florid countenance, their Blood being died with a deeper tincture and colour. Moreover from the filing of Steel dissolved in the Stomach the saline particles are also separated, and have often a notable effect both upon the solid parts and humours: for these being of a vitriolick and styptick nature, do asfringe and corroborate the two loose and debilitated fibres of the *Viscera*, and so restore their vitiated tone: Besides, these saline particles restrain the impetus of the Blood, hinder its too great heat and frothy turgescence, and keep it in an even circulation: moreover (which is their principal vertue) they contract and straiten the over loose, open and gaping mouths of the Arteries, so that neither the Blood nor Serum can issue forth, nor is the thread of the circulation broken off. On which account in the dropsie and hemorrhages Remedies partaking of the saline particles of Iron are of the most famous use and efficacy; for many diseases proceed from this cause, that the mouths of the Arteries being too open and the interstices of the vessels over loose, the Serum or Blood burst forth; which diseases are often cured by the vitriolick particles of Steel, which constringe and corroborate both the Blood-vessels and nervous fibres. Thus the filing of Steel being taken inwardly seems both to spur and bridle the Blood: but inasmuch as the incitation wrought by this Medicine is far more powerful than the restriction, therefore it ought to be given only to those whose Blood is very thick and cold, as to rustick and robust persons; in a very hot and spirituous Blood and hot *Viscera* it is not at all proper. Besides in persons more delicate and of a tender constitution there is danger, lest the particles of the Steel, seeing they cannot be sufficiently dissolved, should strike into the membranes of the bowels like pieces of glass, and sticking firmly to them should produce deadly ulcers and gripings; which I have known sometimes to fall out really. 2. Next to filing of Steel let a second way of preparation be calcining it with Sulphur; namely let a roll of Brimstone be held to plates of Steel made red hot, that the Metal may melt to pieces, which being again calcin'd to consume the sulphur, and ground in a Mortar, are brought to a fine powder that is of excellent use. In this preparation of Steel the sulphureous particles do indeed exhale, the sign whereof is, that this powder upon pouring an Acid liquor upon it boils and waxes hot far less than the filing of Steel; yet when one takes it inwardly, a Sulphureous nidour is raised from it. In the mean time in this preparation the saline particles seem to be a little increased

creased by new ones that accrew to the red hot metal from the Sulphur, so that the active particles of both kinds, namely both Sulphureous and Saline, come almost to a poise: and seeing by this means this Medicine, (the compages of the metal being loosed) may be very subtilly powdered, it becomes of far more excellent use than filing of Steel. In most cases where Steel ought to be given in substance, as in a Cachexie, the Green-sickness and the like, it is convenient to use this Medicine. 3. In the third place comes the preparation of Steel with Vinegar; namely the filing of Steel is to often besprinkled with Vinegar, and dried, as till it may be reduced to an impalpable powder. In this preparation the greatest part of the Sulphureous particles do evaporate; in the mean time the saline are much encreased by others accrewing from the Vinegar, which are mixed with the earthy particles. This powder of Steel hardly froths or bubbles at all upon pouring an acid liquor upon it, and when it is taken inwardly hardly produces any Sulphureous nidour: and therefore it is not so profitable for opening obstructions of the Viscera or restoring the ferment of the Blood: yet in an hot constitution it uses to be given with greater success than the former preparations in the Hemorrhagies and Hypochondriack Melancholy. 4. The Rust of Iron follows, which seems to be the extract or quintessence of the metallick Body: because in that excrecence some particles of all kinds, namely Sulphureous, saline and earthy, being loosed from the compages of the whole, are combined with one another, and make as it were a new mixt or concrete that is more subtil and defecate. Because in this concrete there reside fewer particles of Sulphur, therefore it does not so powerfully ferment the Blood, or unlock obstructions of the Viscera, as Steel prepared with Sulphur: yet in the hotter intemperatures of the parts or Humours it notably performs the intentions that are requisite from a chalybeate Medicine. Thus far of the preparations of Steel wherein the elementary particles of every kind are comprehended, though in a different portion: others remain wherein there is almost but one sort of particles, namely saline, or earthy, the other being driven away for the greatest part, of which sort in a special manner are *Vitriolum Martis* or the Salt of Steel, and *crocus Martis*. 5. For making *Vitriolum Martis*, first of all the metal uses to be eaten by some very acid and corrosive liquor, and to be dissolved into elementary parts: in the dissolution the saline particles of the *Mensstruum* hit upon the saline ones of the Iron, and are intimately combined with them, the other particles, viz. the Sulphureous and saline being in the mean time set aside and excluded from their fellowship: then common water being poured on the solution, the combined salts of both kinds are imbibed by the liquor, and the liquor being filtrated and evaporated the salts run into crystals. Such kind of salification succeeds well either with spirit of vitriol, oyl of sulphur, *aqua stygia*, or other distilled flagmas of Minerals: yea sal Armoniack only dissolved *per deliquium*, dissolves Iron in the same manner and disposes it to crystallize. *Sul Martis* (or the salt of Steel) being thus prepared has a sweetish tast with a certain rough stypticity, and so far partakes of a vitriolick nature that it seems not to differ much from green coprose: but being taken inwardly it does in some measure ferment the Humours, and pretty powerfully constringe the nervous fibres. This Medicine is not so proper in cold and phlegmatick cachexies, because no particles of the sulphur are exerted: but in hot intemperatures of the bowels with the prevailing of a dust sulphur, also in the wandering scorbutical and unequal effervescences of the blood and nervous juyce, being taken by it self or mixt with other Medicines for a Stimulus, it is often used with suc-

cess: yet in more tender constitutions there is danger lest the tone and fibres of the stomach should be hurt by its acrimony and too great constriction. 6. Lastly comes *Crocus Martis adstringens* prepared by a long calcination by the fire: namely let the filing, *Scoria* or plates of Iron be so placed in a reverberatory furnace, that it may be continually beat upon by an hot flame: the filing being thus placed will at first grow red after a fort, and run together into hard lumps; but after three or four days, suddenly swelling into an higher heap, it will become very light, impalpable and of a curious purple colour. In this preparation the sulphureous and saline particles, whilst by the force of the fire they begin to be driven from the concrete, do catch hold of one another, and so being mutually combined grow into lumps: yet afterwards these particles, both saline and sulphureous, being utterly put to flight, and the fiery succeeding in their room, the whole mass swelling in bulk and being made spongy as it were, becomes exceeding light. The Medicine thus prepared is in some cases of excellent use and inferior to no chalybeate; namely in all extravasation and too great eruption of the serum and blood, as in external and internal hemorrhagies; in a *diarrhea* and *diabetes*; in a violent catarrh; also in the beginning of an *Ascites* or dropsie I know nothing better. But some may think, that if this Medicine be destitute of saline and sulphureous particles, there is nothing left but a *caput mortuum*? *Ans.* 1. Its efficacy depends upon the fiery particles (being included in the most fixed earth) that break out within the body. 2. The earthy particles being wholly destitute of the saline (whereby they were very faintly held) do very greedily desire to be reunited to the same or the like: wherefore this *Crocus Martis* being taken into our body does snatch and close with all the salts it meets with; and so while like a sponge it sucks up very many saline particles, it takes away many enormities that arise chiefly from the fluor of the salts: upon this account burnt Hartshorn, *Spodium*, *Antimonium Diaphoreticum*, &c. do good.

XXXVI. It is doubtful in what parts of it its astringent vertue, and in what its opening and loosening consist; and this we ought to know, lest whilst we would bind, we loosen and open. Divers men think diversly; I am of opinion that the opening vertue of Steel is not superficial, but lies hid within, and cannot be drawn forth but by many heatings of it and long preparations, which may loose the strait compages of the Iron: Hence I determine that the first infusions do bind, that the strong and often repeated do open: Thus chalybeate milk and wine bind, if the extinction be moderate, but when it is plentiful, the belly is loosened by them through a larger quantity of the substance of the Steel mixed with them: inasmuch as the opening vertue consists in its vitriolick part, which cannot so easily be drawn out. Therefore the oldest Iron that has been often heated is preferred, because it may be more easily prepared and dissolved. It also uses to be prepared by vinegar and wine, and by the sharpest liquors, to bring out the opening vertue that lies hid in it. But water and milk, and other soft liquors can draw nothing out of Iron, and therefore they bind, unless its vertue be drawn out of the fire in often heating of it. Thus mineral waters, that spring from Iron and vitriol, do open very powerfully, which have not the substance of the Iron it self, but only its more pure and spirituous part mixed with them by the subterraneous fire.

XXXVII. Note, that Chalybeate Medicines (amongst which *Augenius's* Electuary of Steel is famous) does operate more happily, if wine be diluted in Steel water and aliments boyled therein.

c. 1.

XXXVIII. There want not some who make an *Electuary of Steel* with Agarick, Carthamus seed, *Senna*, Mechoacan, &c. which practice is by no means to be admitted of; for if the Physician intend to strengthen, to open obstructions, to unlock stuff parts and provoke sweat, by incising the thick humours, and widening the pipes by exercise, why will you procure a contrary motion by provoking to stool? Besides, those that take Steel are wearied with exercise to make them sweat, why therefore shall they on the same day be tormented with an evacuation by stool? Moreover violence is offered to nature, which is very much cast down by this inequality of motions. 'Tis better therefore by intervals to purge out the thicker part of the humours by stool, resting two days from the chalybeate for that purpose, whereupon some mild purger may be given. Nor did *Galen l. de ther. cap. 16. Actius tetrab. 3. ferm. 3. Paulus lib. 7. tit. de ferro*, *Rhases* and others use to mix Steel with purgers when they used it to waste great Spleens, and to root out stubborn obstructions.

Zacut. Pr.
h. p. 485.

XXXIX. Cordials seem fitting to be mixed with Steel, seeing it is an enemy to the parts, and causes griping, head-ach, dryness of the mouth and inflammation. It is reckoned among poisons by *Avicenn. 64. tr. 1. cap. 48*. But that is to be understood of that which is not corrected, or is not given seasonably and in a moderate dose. Wherefore I have always thought it more adviseable to mix with it things that may increase its virtue, that have a similitude with the part affected, and may correct its hurtful quality, in the number of which are Treacle, Mithridate, *Diarrhodon Abbatis*, *Aromaticum rosatum*, &c.

Idem
ibid.

XL. The Body should be well purged before the use of Steel, especially in the Spring time which is the fittest season to give it in, seeing the faculties are then strongest and the Organs best disposed; or else take it in the Autumn, if the cure cannot be deferred till spring; not in Summer, for though through the heat the Medicine may then be sooner distributed, yet the faculties languish, and by the requisite exercise a Fever may be kindled: In Winter the Humours are concrete, the pipes straitned, and there is no place for exercise because of the coldness of the ambient air.

Idem p. 484.

XLI. It is commonly enough known that the Salt of Nitre cools the Blood and powerfully provokes Urine: but the reason of both effects appears not so plainly, because Nitre is so far from containing in it self cooling particles, that on the contrary nothing is more igniparous or productive of fire, as we see in Gun-powder; and if it be distill'd, there seems to pass forth into the receiver rather a flame than a vapour or smoak: moreover the liquor that is distilled, burns and corrodes all the Bodies it touches, like actual fire. Nor is it less wonderful how this, whose nature is so very fiery, should so dilute the Blood and fuse it into aquosities for provoking Urine. That I may propose my conjectures about these matters, I say that Nitre does contribute to these effects in a twofold respect, viz. both as it is a Salt, something of kin with both a fixed and volatil, and as it is *πυρρὸν*, a fiery thing. As to the first I have observed that Nitre (as also fixed and volatil Salts) being put into Milk does either hinder or take away its coagulation: in like manner hot Blood being poured upon it (no less than upon them) is preserved from coagulation and discoloration. Wherefore inasmuch as the particles of the Nitre taken inwardly do preserve or restore an intire mixture to the Blood, they will therefore prevent or remove the fusions and coagulations of the same, from which heat and stoppage of Urine do very often arise. But besides, Nitre, as it is fiery, being taken inwardly cools the hot Blood and provokes Urine, inasmuch as it kindles the flame of the Blood more that was

before turbid and mixed with smoak, and makes it more clear and pure, and therefore more mild: and seeing thus the Blood, while it is made to burn clearer by the Nitre, is more loosened in its consistence, the ferrous particles extricate themselves more easily and depart more plentifully from the willis thicker.

XLII. The use of Oxymel and Hydromel was in far greater repute among the Ancients than now among us. The Arabians, who first brought in the use of Sugar, are the cause that divers kinds of them have been turned into Syrups, of which there is a great number: but that which is urged for establishing the use of these, viz. that they may be kept longer and are more grateful to the palate, wants to be proved: But it is without all doubt, that all the kinds of Hydromel, and especially of oxymel, but chiefly that which is called *Meliceratum* (when Water, Honey, and sometimes Vinegar are mixt together) are far more profitable, convenient, yea fitter for all curative intentions, than Syrups are: seeing Sugar is a certain sweet Salt induced with not a little heat, to which a certain obstructing & glutinating quality is joined, whence it may be esteemed not so fitting for preparation, alteration, mitigation of Humours and excretion of them, for which purpose syrups are composed. Add hereto, that in cholerick & naturally lean Bodies, like other sweet things, they easily turn to choler, whence there happens more harm than benefit to such. You will object the sweetness of Honey: we will admit that, but this is far more defecate and pure, and endued with a Nature that is more aereal, celestial and approaching toward a quintessence, than Sugar, which though it be superficially sweet, yet inwardly it abounds with an Acrimony and no little blackness, as those know well and find that have made any progress in the inward and vital Anatomy of things. Which was noted and diligently observed by *Galen*, and after by *Oribasius medic. collig. l. 5. c. 24*. who while he extols the faculties of oxymel that are acid and vitriolate, prefers it before Hydromel, which for its sweetness is not so agreeable for hot temperaments and more fervid natures, because it is easily turned into choler. Seeing, says he, the faculty of *Meliceratum* has all other things, that are good for acute Diseases, yet in one only it is contrary to them, that being over-heated it is turned into choler: the mixing of Vinegar with it hindring this change of it, makes it an excellent Medicine, and so much Vinegar is to be put in the *Meliceratum* as may be sufficient to correct its aptness to turn to choler. *Querc. pharm. dogm. c. 76.*

XLIII. *Galen (l. 6. de Med. Simplic. Chap. of Plantain)* says, that its leaves and roots being dried avail to open Obstructions of the Liver and Kidneys: for Plantain being dried abstergeth and discusseth, as the green represseth. Hence let the error of those be noted, that in the Winter use dried Herbs instead of green, which differ very much in nature and qualities. *Sanctor. met. vit. error. l. 13. c. 3.*

XLIV. Young Physicians are to be admonished, that in correcting glutinous Phlegm they be careful not to use much Sugar, or very sugared Medicines, seeing the Phlegm is not so much corrected and dissolved thereby, as made every day more glutinous. *Fr. Sylvius Pract. l. 1. c. 34.*

XLV. It is well known that Wormwood cleanses the Blood, brings forth Choler and provokes Urine, and evacuates almost all the Recrements of the Body insensibly: But that the too great use of it is hurtful, appears by this example: A certain man in the Spring and Autumn used daily to devour several whole leaves, without any nausea for many days: At length in the Spring eating too much he fell into a cholerick looseness without trouble, which stayed of it self: In the Autumn following betaking himself again to it as to a Panacea, and eating it as plentifully as before, he fell into a difficulty of Urine with great heat in making of it: and he made a muddy,

J. Udalr.
Rumler.
Obs. 47.

muddy, thick and stinking Urine, and that often. Being bid to refrain, he grew well in a few days.

XLVI. Common Wormwood is astringent; bitter; acrimonious, heating likewise and exterging, strengthening and drying, as Galen teaches 6. Simpl. 69. though it be of unlike Parts, viz. hot in the first degree and dry in the third: and its juice is far hotter than the Herb. Note therefore this discrepancy of its Parts which appears very manifestly, lest whilst Authors extoll the use of Wormwood with the highest Praises, we be indifferent at what time of the Disease, or in what Diseases we use it. For seeing its stypticity is stronger than its bitterness, as Avicenna has it (L. 2. tract. 2. c. 2.) we must take heed to whom we give it. Wormwood is the chiefest of those Medicines that help while the Disease is drawing on towards its state, to rectify and mature the matter it self, and to remedy its hurtfulness: but after signs of digestion it is not good, for it only moveth the Humours and does not evacuate them, it causeth straitness of Breath, and pensiveness and loathing, and reverts upon the Patients with its heat, and dries them, and makes them costive by its stypticity. Thus far Avicenna.

S. Pauli Quadrip. Botan. class. 2. tit. absinth.

XLVII. Some Preparers are Universal, others Particular. The former are not so called strictly, as if they were alike proper for all Humours; but such have that name as are Polychresta, good in several cases, and are of more common and frequent use. Such are Aperitives, Antiscorbuticks, Anticacethicks, Hepaticks and Spleneticks. For the more frequent causes that hinder the vertue of Purgers to operate according to desire, are obstruction of the Vessels, driness of the Humours and a Scorbutick taint: And so neither Tartar vitriolated, nor the Cream or Crystals of Tartar, nor the *mistura simplex* it self deserve or ought to be called Universal Digestives on any other account than this, that they have a notable unlocking faculty, and satisfy many indications. Particular Preparers are Alteratives, and such as open or incrassate slenderly: and of this sort are those Remedies that are appropriated to certain Parts.

Gr. W. Wedel. de C. m. fic. p. 128.

XLVIII. Cholera naturally is of a Saffron colour in two respects; for when it is thicker, it is a little reddish like Saffron, but being more dilute it is yellow. This colour is preternaturally changed into various kinds of green, and sometimes into a sky colour, or a black. Now because I am taught by long and manifold Experience, that all this change of colour in cholera depends on the Pancreatick juice's being mixed with it, in which is a multifarious acid acrimony, any one may see that the alteration of the colour signifies not a primary fault in the cholera, but a secondary and such as is owing to the said juice, and indicates its correction to be by correcting the same juice. When therefore the cholera acquiring a colour different from the natural becomes more acrimonious, and that acrimony is not its own proper and lixivious saline, but adventitious and foreign, namely acid, which yet varies gradually accordingly as its colour changes; the species of the Corrector is withal indicated, namely such as is fit to correct, break and temper an acid. For 'tis obvious that eruginous and deeply green cholera, does by its smell and griping give manifest signs of its offending acidity: as black cholera does yet more manifestly evince it, which will make a notable effervescence in a Copper Vessel, nay upon the ground it self, such as is altogether like to that which *aque fortes* use to raise in the same. As to the taste of the cholera, 'tis known that cholera is naturally bitter, but that preternaturally it is sometimes of a vitriolate taste, but joined with a notable bitterness which there is but little of in Vitriol. This vitriolate taste of the cholera signifies that much acid is mixed with it, and so indicates the contemperation and correction of the same: And Cholera that is less bitter, indicates a defect of bitterness, and also requires an increase. As to the smell, the natural can

hardly be expressed, unless we call it *bitterish*; hence we say that eruginous cholera smells of an acid, when indeed its smell and *halitus* being mixed with the inspired Air in the Nose penetrates even to the Throat, and there manifests its acrimonious acidity to the taste, though we call it a scent. The stid or rank smell of Belchings is ascribed to corrupted or corrupting cholera, inclining towards the nature of eruginous. But when it smells of an acid, as it is a sign that a more acid Pancreatick and Melancholick Humour is mixed with it, so it indicates the correction of the same, &c.

XLIX. The saltiness of the serum, if I guess well, being such as we observe in Sea-salt, *sal gemma* and the like, seems to derive its origine chiefly from a pretty pure lixivial Salt and acid Spirit mixed together, yet the acid Spirit exceeding a little. Now things contempering this saltiness are Gum Tragacanth, Arabick, Mastich, Frankincense, Styra calamita, Henbane seed, the root of Houndstongue, &c. as also the Pills called *de Styra*, de *Cynoglossa* and *arnoglossa* or Plantagine, by which, salt and ferous Humours are tempered and corrected, as Experience witnesseth.

L. In a melancholick *cachymie* both the defective serum is to be restored by moisteners, and its kindly vigour by absorbing the acid and fowr Humours with heating Aromatics. But acids as they are good for the Choleric and Phlegmatick, so they are hurtful for Melancholicks; for they more obstruct the Sulphur.

LI. But atrabilary Humours, or the more intense sulphureous parts of the Blood exalted with acid salts and exceeding in acrimony, need more dilution and temperation, whence nitrous and absterging watry Remedies are to be preferred before others: and whereas the viscera do greatly cherish this evil, Remedies that depurate the Blood, open and absorb, do chiefly benefit.

LII. Many attend not to the correction of the offending acid, because the knowledge and doctrine of acrimonious things has hitherto been confused among Physicians, who have made no distinction of acrimony: but now a twofold Acrimony (and that contrary the one to the other) being manifested by me to such as are willing to be wise, and confirmed for some years by the Experience of many, many attend more both to the vertue and daily mischiefs of each sort of acrimony, and also to the best correction of the same. ¶ Whatsoever in nature is observed to be acrimonious and biting besides fire, is all of it either an acid Spirit, or a lixivious Salt, or, to speak with Pliny, a *lixivium*, (or Lye) in regard that from the ashes of things burnt it either turns into a Lye of its own accord by means of the moist and watry Air, or is drawn therefrom by pouring water upon them, & then by evaporating the water it may be reduced to the consistence of Salt: the more acrimonious whereof we use to eat little Ulcers in the Skin for Issues. Where note that both the lixivial Salt and acid Spirit obtain their notable acrimony from the fire, seeing both are prepared from a saline matter by the force of a sharp fire. Now seeing no such or so great fire can be kindled in our Body, as is needful for the making of an acid Spirit, it is not to be supposed that any acid Spirit is properly prepared in the Body, but only principally separated and freed from the tempering impediments, viz. Oil and volatil Spirit. A pretty pure acid Spirit has often been observed in the Body, even without the use or abuse of any thing that has been manifestly acid: Thus diverse-coloured stools are observed in Infants, yet commonly of a various green, and smelling acid, whence doubtless Epileptick Fits have their origine from an acid Spirit fermenting in the small Guts with the cholera. Thus torturing Pains in any part of the Body that sometimes arise like lightning on a sudden, or otherwise rack cruelly, yield a certain Argument

Sylv. de le Boe m. m. l. i. c. 7.

Idem, Append. tract. x. in fine.

Idem.

Idem.

Idem c. 5. §. 57.

that

that there is an acid Spirit separately in the Body that is very moveable and gnaws the sensible Parts. So rottenness of the Bones shews that there is a too pure acid Spirit in the Body, which is clear from the intolerable Pains that often go before and which can only be deduced from acidity: Namely the acrimony arising from a lixivial Salt abides more fixt in the same place, and seems to burn the Part affected, while an acid Spirit is judged to hit, or tear, or perforate by repeated gnawings the Part that is seized upon by it. This conjecture of mine has been confirmed by spittle that has sometimes been so acid, as to set the Teeth on edge like other acids taken into the Mouth. The matter of acid Humours is supplied to the Glands from the arterial Blood, wherein that there are acid Spirits is evinced both by its coagulation into clods when it is let out of the Vessels, and also by the corrosion and consumption of the Bones that is made by the arterial Blood in an Aneurism. The acrimony of an acid Spirit is temper'd chiefly by a volatil Spirit that sweetens the same being easily united to it: Thus Spirit of Wine being cohobated with Spirit of Salt does so lenise the same, that it is then called sweet by Artists. The same is temper'd by all sweet things, but these do more difficultly unite with it, if it were not for the lixivial Salt that is mixt with the fat. For as an acid and volatil Spirit are easily joined throughly with one another, and an Oil is easily mixed with a lixivial Salt: so on the contrary a volatil Spirit and lixivial Salt do more difficultly combine together, and the most difficultly of all an acid Spirit and Oil. ¶ Though all acrimony seem to produce a sense of heat in sensible Parts; yet from the cure there appears to be a different acrimony, one indeed joined with heat, and another destitute of it. And seeing we have not only discover'd two sorts of acrimony that are found in our Body, but besides from their conflux, because of other things that are joined with them, a double effervescence is observed to be produced, both an *hot* and also a *cold*, which are not only manifest to sense, and therefore distinct from one another, but yielding to different Remedies, and so also differing from one another; It may deservedly be queried, what sort of heat that is which uses to accompany now and then (for instance) the flux of the Terms, whether that which has its rise only from an *hot* effervescence, or also from a *cold*? or whether from each acrimony offending without such an effervescence? By neglecting this question and the clearing and determination hereof, we should undertake an Empirical, rash and often a pernicious cure: For seeing the heat may be produced from divers causes, it is also to be cured diversly according to the diversity of the cause. And if any object, that I have taught that both sorts of acrimony may be allay'd and temper'd by the same Medicines, both spirituous, and oily, and watry, and that therefore it matters little what acrimony offend, seeing the same Medicines are profitable in both cases: I answer, that both sorts of acrimony are indeed temper'd by the same Medicines, but not alike quickly and powerfully, seeing oily Medicines do both more easily, and quickly and powerfully temper a lixivial Salt, as on the contrary spirituous volatils an acid Spirit; so that though all things that temper either sort of acrimony are always administered with Profit, and especially when there want signs that may demonstrate sufficiently whether of them do primarily and chiefly offend; yet as often as it can be known which offends, it is better to use chiefly those Remedies that are especially conducive to the tempering of it: which as it is sometimes known from concurring signs and symptoms, so it is frequently concluded from the different operation of the Medicine that is given, that is a *juvantibus vel nocentibus* (from helpers or hurters) according to the golden axiom of Practitioners. The

heat therefore that is produced (for instance) from the menstuous Blood in the ways through which it is poured forth, has sometimes, yea indeed often, its rise from an acid Humour that is in the Womb, and which comes forth with the Blood, whether it make none, or an *hot* effervescence therewith: If the acid Humour that is found preternaturally in the substance of the Womb, cause no effervescence with the menstuous Blood, there will rather be felt a troublesome gnawing than a true heat in the Parts affected: But if the same acid juice do cause an *hot* effervescence with the menstuous Blood, then there will be raised an heat, and often a redness also even in the extreme Parts: and both will be observed, when the acid does either notably gnaw only, or also burns withal; but as often as the offending matter is more gentle, or more broken; then we cannot so distinctly conclude in what regard the acrimony offends. I am therefore of opinion, that in the heat that accompanies the flux of the Terms an acid always offends, whereto is sometimes joined a more or less choleric Blood, whence the said heat uses to be diversly changed and felt. ¶ An acid acrimony is temper'd by several oleous things, by Oil it self, any sort of Milk, Broth of flesh, especially such as is fat, Emulsions prepared of divers sorts of Seeds, especially of sweet Almonds: Moreover by sweet things, Sugar, Honey, Raisins, and sometimes by spirituous things, or others that concentrate an acid, such as Corals, Perles. A lixivial, and aromack acrimony, such as is in Pepper, Cloves, Rocket and the like, is temper'd by both the aforesaid oily and sweet things; yet 'tis safer to abstain wholly or in a great measure from them. A Salt acrimony, such as is in Sea and Pit salt, and most salted things, is wonderfully corrected by Lime made of burnt Flints or Shells, which no prudent Physician will be any longer afraid of, but may be used with very good success for very many Diseases under the form of a Lye.

LIII. We must take great heed that in curing one offending Humour we hurt not another. For though it appear from Experience that the Medicines which are taken, act chiefly on the offending Humours, when they are most proper for correcting them; yet it is also manifest that the Medicines that are fit to alter several different Humours, do in some measure also operate upon the Humours that do not offend, when they are either taken in too great a quantity at once, or for too long a continuance. Though therefore there arise not always presently any notable hurt from the use of such Medicines that are not in every respect accommodated to the offending Humours; yet the same shews it self by degrees to such Physicians as are diligent observers of all the changes that happen to their Patients: which Physicians when they foresee any thing that will hurt, do prudently provide for the same, and change those Medicines from which they see not plainly that their proposed scope is to be hoped.

LIV. Both effervescence being vitiated in the small Guts and Heart, and being joined with a troublesome heat, is bridled and reduced to a moderate and temperate degree, partly by acid and sour Medicines, especially being joined with *Opiats*, to which doubtless the fixed Sulphurs of Minerals and Metals are to be preferred; which if any one cannot have in an excellent perfect degree, let him at least endeavour to make them sweet, such as will neither provoke Vomit nor Stool. For those Sulphurs, so long as they are volatil and combustible, use to provoke Vomit and Stool, which in this case is hurtful, namely when we have a mind to bridle a too great effervescence, and to reduce it to a laudable mediocrity: for the Humours are disturbed by all Purgers, and the effervescence promoted and not restrained. Now for want of such Sulphurs as are sufficiently fixt, we may successfully use *Opiats* joined with

with acid and sour Medicines: whence on this account the extract of *Opium* with distilled Vinegar, is better than that made with Spirit of Wine, seeing by such Preparation it is fitted for tempering the too great effervescence of the Blood. The same effervescence is much bridled by an emulsion of Barley, of white Poppy Seeds, yea of sweet Almonds.

Idem Append. Tract. I. Sect. 7, 8.

LV. The Pancreatick juice abounding too much in the Body indicates its diminution, and that by Stool. Where note, that seeing it is naturally subacid, it is good to prepare it a little first for the more easie carrying of it forth, by further tempering its acidity and in a fort concentrating of it, which is best done by volatil Salts and afterwards using Hydragogues, seeing the liquor is of it self thin enough, clear and subacid, and therefore coming nearest the consistence of Serum, though now and then it become proternaturally glutinous, and so incline more to the nature of Phlegm.

Idem Meth. Med. I. c. 16.

LVI. Seeing all the Humours ought to be fluid, they offend variously, as often as they lose that fluidity either in whole or in part, or have it more than they use or ought to have it. The Blood loses its fluidity wholly, when it cardles and coagulates into clots: and this is done either by the external cold of the Air, Water, &c. or by eating or drinking acid and sour things especially, or glutinous or earthy, also by sadness of mind, or affrightment, or by sluggishness and rest of the Body; or lastly by too much sleep. Now according to the diversity of the cause is the diminished fluidity of the Blood to be cured diversly: for when its fluidity is diminished from the external cold of the Air or Water, then not only it is to be restored, but also the diminishing cause is to be expelled forth by the same way it came in: Thus besides volatil Salts, and divers things derived from Animals, as Crabs eyes, Mummy, Sperma celi, &c. the more grateful and acrimonious aromack Plants are likewise good, especially such as may at the same time drive forth Sweat, and therewith also the mischief induced by the Air. When it is coagulated more than usual by acid things taken inwardly, let such things be used as both infringe, concentrate and enervate an acid, and also dissolve the coagulation it self, and so make the Blood fluid again. Things infringing the force of an acid are Chalk, Corals, Crabs eyes, Perles, &c. Aromatics make the coagulated Blood fluid: Volatil Salts do both. When the consistence of the Blood is increased and its fluidity lessen'd by austere or sour things, it is harder to restore; but no Remedies that are commended by any for this, can be compared with volatil Salts, as both powerfully correcting austerity, and happily taking away and curing the hurtful effect thereof: add, that most things that are received into use are derived from Animals, and contain much Salt: Hither are to be referred the more gentle Aromatics. When the Blood is not fluid enough through the abuse of glutinous things, things profiting are 1. Spirituous acids; 2. The more acrimonious Aromatics; 3. Pickles and Medicines prepared of a mixture of both; 4. Volatil Salts. When the consistence of the Blood is increased from earthy things used amiss in the Green sickness, it very difficultly and that but slowly yields even to the best Remedies: for which purpose I have hitherto found volatil Salts the best. When the Blood is made less fluid through sadness of mind or some great fright, then both the mind is to be comforted and confirmed, and the fault that is introduced upon the Blood, amended; which because it is like to that which is caused by sour things, is to be corrected with the same. If from too much rest of the Body the Blood be made more sluggish in its motion, that mischief will be repaired by the motion of the Body: When from too much sleep, it will be corrected by waking longer; if so be these changes, viz. of the motion of the Body and waking, be made by degrees, not all of a sudden.

Purgation.

The Contents.

One may Purge when there is neither concoction nor turgescence of the Humours. I.
What is to be understood by Concoction. II.
A perfect one is not always to be tarried for. III.
We must take heed how we Purge when there are signs of Concoction present. IV.
What an orgasm or turgency of Humours is. V.
Cold Humours are sometimes turgent. VI.
Whether turgent Humours are always to be Purged. VII.
Whether we must Purge in the beginning of a Disease. VIII.
How to know the time when to give a Minorative. IX.
Purging is not necessary in all Diseases. X.
The distinction of the Regions of the Body. XI.
Purging evacuates extravasated Humours. XII.
All internal Inflammation hinders it not. XIII.
Whether the same strength of the Faculties be required to Purging, as is required to Bleeding. XIV.
An indication for Purging is taken from the condition of the Urine. XV.
At what time of the Disease to Purge. XVI.
It is not to be deferred when there appear signs of concoction. XVII.
What Humours are easiest expelled by Stool, and which by Sweat and Urine. XVIII.
How the Melancolick Humour so called, is to be Purged. XIX.
A salt Humour is presently to be expelled. XX.
How acrimonious choleric Humours are to be Purged. XXI.
Sometimes a critical evacuation is to be prevented. XXII.
Choler is not to be wholly evacuated, seeing it is a profitable Humour. XXIII.
When it is to be Purged, and we fear a cholera, diarrhoea, &c. Medicines are to be given in a small dose. XXIV.
Pills with Gums are most profitable for the Purging of tough Phlegm. XXV.
How acid Humours are to be Purged. XXVI.
At what season of the year thick or thin Humours are to be Purged. XXVII.
Whether we may Purge on Critical days. XXVIII.
Whether we may Purge in the Dog days. XXIX.
Whether the Aspects of the Moon be to be observed. XXX.
The rise not only of the Dog-Star, but of other Stars also is to be heeded. XXXI.
Preservative Purgation is to be performed in the wane of the Moon. XXXII.
In what state of the Moon are the more fixed Humours to be Purged? XXXIII.
What Planets being in conjunction with the Moon render Purging difficult. XXXIV.
What state of the Moon is to be noted with respect to the condition of the Humours. XXXV.
The consideration of the Stars has only place in preventions. XXXVI.
We must rather Purge in the wane of the Moon than in the increase. XXXVII.
How to know whether a man is easie or hard to Purge. XXXVIII.
Mild Purges being repeated are better than one strong one. XXXIX.
A Purging Medicine that works not is hurtful. XL.
We must not hasten to Purge without preparing the Body. XLI.
Some bear Purging easily, others not so well. XLII.
Redundance or overflowing of Excrements sometimes hinders Purging. XLIII.
When both Vomiting and Purging are necessary, with which must we begin? XLIV.
If we must Purge per Epicrasin, it must be done without intermission. XLV.

When

When the Humours are crude, Lenitives only have place. XLVI.

The heaviness of the Body shews Purgation to be necessary. XLVII.

Purgers attract not determinate Humours. XCVIII.

Seeing they attract not electively, why is there a choice made of them? XCIX.

How the vertue of Purgers is to be drawn forth? C.

Many Purgers ought to be turned out of that order. CI.

A small quantity of Purgers being mixt with Aperients Purgeth not, but assists the vertue of these. CII.

Metallick Purgers are hardly used safely for prevention. CIII.

Vegetables need not much Chymical preparation. CIV.

After taking a resinous Purger, we must drink nothing that is cold. CV.

The Fermentation of Purgers varies their Dose and Vertues: See Purgers, § I.

Whereupon the vertue of Purgers depends, and by what things it is dulled. CVI.

Purgers do not always hurt when they do not operate by Stool. CVII.

Purgation of Choler is to be made in the Spring for prevention. CVIII.

Antimonium Diaphoreticum being added to Purgers increases their vertue. CIX.

I. Some question whether Purgings ever do good before Concoction, and without turgescence? I have found by Experience that it does so sometimes, and there is reason why it may. For if it be certain that symptomatical evacuations are sometimes profitable, Purgings before concoction may also happen to be so. For if there be a time when Nature her self, without any external provoker, does profitably expel things unconcocted; there may be a time also when she may be benefited with helping her by a provocative to do that which otherwhiles she does of her own accord: And if she can profitably evacuate without help, she may evacuate more profitably when assisted by the help of Art; for nothing can hinder Purgings before Concoction, that does not also, and far more oppose symptomatical evacuation. But when besides want of Concoction or turgescence, there are present all other conditions that may disswade from Purgings, then abstaining wholly from it, if I may not let Blood, I will however provide for the faculty, and use only Clysters and Suppositories. But if, though there be neither Concoction nor turgescence, yet other conditions do not wholly deter me, I will venture to Purge for urgency, and that by so much the more confidently, by how much the conditions that invite shall be the more numerous; for this is indicated, if the evacuation may profit and not hurt, which it is the part of an Artist to find out. Now by what conditions one may know whether this or that Person are to be Purged at this time, I shall endeavour from Reason and Experience to shew. A special condition that permits Purgation is, if the Hypochondres be quite free of a Phlegmon; for if any one shall endeavour to remedy an inflamed Part by Purgings, he shall take nothing of that away which is inflamed, but shall increase the Phlegmon, cause a colliquation, and so procure Death. Moreover a moderate Fever permits it; but if a Purge be given in a very high burning Fever, the hot flesh attracts it, and so nothing is evacuated, but the Fever and Cacoehymie is increased: But a principal thing that hinders, is the heat of the Head and spiritual Parts; because these Parts when they are hot, are apt to draw all things to themselves, and to absorb what the Medicine stirs: Driness of the Belly or costiveness also hinder; because this indicates that the Humours incline some other way, and 'tis to be feared that when they are moved and not evacuated, but snatcht some other way, they prove a cause of greater mischief. 'Tis also of very great moment to consider the nature of a man; for some are easie to Purge, and that without any Symptoms or Mischief, Purge them when you will: Some are so hard, that though they be Purged in the fittest Season, they are seized upon by horrible Symptoms, and are manifestly worse afterwards. When these conditions that hinder are two or more of them present, we must rather put it to the hazard than Purge: But if the Patient be one of those that are easie to Purge, and be sick of a Putrid Fever, with some suspicion of Malignity, if he have been let Blood sufficiently, and the Humours be not turgent indeed and wandering up and down,

nor yet altogether quiet, but fufed as it were and tending towards the Belly, which is fhewn by a rumbling in the Hypochondres or loofe Stools, two or three in a day (for this is no fmall invitation to Purge) if the Hypochondres themfelves be loofe and not hot to any confiderable degree; nor the fiefh burn through the whole habit of the Body; if there be felt no great heat in the Head or Breaft when one lays his hand thereon, but the Fever that is, is difperfed equally all over the Body, or incline to the lower Parts; in thefe cafes, though there be no concoction as yet, I will give a Purging Medicine, becaufe that which is prefent does not very much hinder; and that which is feared, is urgent; and the indication of urgency is the firft of all. But if there feem to be any Inflammation or Phlegmon lying hid in the Belly, though I fear a Cacoehymie; I will not give a Purge; I will rather venture, even though the faculty be doubtful, to let more Blood than I had thought for: I will do the like, if the Breaft or Head, or all the fiefh burn vehemently, unlefs there be great defpair of the faculty; for if there be, I will moiften the Head with Vinegar of Rofes, the Breaft or even all the Body over with Water and Oyl, and will give cold things to drink. So if he I am a fpeaking of be very coftive, I will refrain Purging, though I fear the nature of the Humours, till I have firft a little foftened the Belly with mollifying Clyfters (for acrimonious ones are not good for this purpofe, becaufe they have the hurt of Purgers in them, and rather dry the Belly) and the ufe of light Meats, as fiew'd Prunes, &c. But it is manifeft that if two or more of the aforefaid things hinder, we muft take a courfe with them before we Purge, and that together, if we can, as if both the Head burn and the Belly be dry, the Belly muft be foftened and the Head cooled by irrigation at the fame time. But if the Difafe do not at all yield to thefe Remedies, but the concurrence of Symptoms continue, and there be no urgent caufe, we muft not Purge, for if we do, the Patient will on the fame day be taken with light-headednefs and convulfion, and, it may be, die to the great infamy of the Phyfician: We muft therefore do any thing rather. There are many things in this Art, wherein for urgencies fake, it is an art to depart from Art, &c.

II. Many keep a great pother about expounding Aphor. 22. 1. and 29. 2. Things concocted are to be purged forth, and not crude, &c. But in my opinion the matter is not fo abftrufe: for I think that Hippocrates underftood nothing elfe by things concocted, but fuch things as may be feparated from the mafs of Blood: And in the other aphorifm, by the words [If any thing be to be moved, move it in the beginning of the Difafe] I think he means that we fhould purge prefently after the beginning of the Difafe, before the vitious Humours, by means of the perpetual motion of the Heart, be confufed and mixt with the whole mafs of Blood. For if we please to confider this matter further, we fee that Humours may then be feparated, 1. when they are overcome by Nature: 2. when fome vitious matter sticking fomewhere in the Body, is not as yet confounded with the Blood, as I have faid: 3. when by due helps we affift Nature that is endeavouring to attenuate and conquer the Humours.

III. A concoction of the Humours is not always to be tarried for, nor is their preparation always to be premifed: before we will purge the Body: for when the matter is moveable, prepared for excretion, ebullient or turgent, what need is there of digeftives? and one Purge does generally lefs offend the Stomach than fo often repeated digeftive potions, that difsolve and taint the Stomach, fo that crudities being thereupon increafed, there is a greater afflux to the joints (he is fpeaking of the Gout.) Add hereto that while we are bufied with

digeftives, the pains increafes, the ftrength decreafes, time is loft, and there is not always place for purgation afterward.

IV. I affirm that Purges may be fometimes given without concoction becaufe of urgency; but yet not unlefs there be fome fignification that the Humour is inclining towards the Belly, or at leaft that it is not very averfe from that way; feeing Hippocrates requires that in thofe purgations that are to be made in the beginning, and while the Humour is not as yet concocted, there fhould at leaft be prefent a rumbling in the Hypochondres: I am of opinion that any vergency may ferve inftead of fuch rumbling, as if the Belly be loofe and moift. But if befides that there is no fign of concoction, the lower evacuations be very much fuppreffed, and the Humours fnatched fome other way, the greater the Difafe feems, the lefs dare I give a Purge, becaufe it feems more certainly to happen that the man will die with madnefs and convulfion, of internal Inflammation and the extreme parts cold.

V. Hippocrates fays that crude things are not to be purged, but concocted, nor in the beginning unlefs they be turgent. Galen in comm. explains the word *ὑγρῶν*, and fays it is tranflated from Animals that are excited to venery, unto the Humours: 'tis likely that the Humours are not only turgent, or moved up and down the Body, but that there is moreover an impulfion of irritated Nature. Nor are the Humours to be thought then only to be turgent, when they are moved this way and that way reciprocally, in a wandring manner, with fear of ruftling into fome principal part; but alfo when they incline to a certain more ignoble part that is deftin'd for evacuation, to wit, the Stomach and Guts, & worshipping upon their Knees as it were, implore the Phyficians help, intimating by a dumb voice, either by fwelling and elevation of the Body, or by the rumbling thereof, that fhe is burthened and preffed with a troublefome load. If fuch things happen in continual and burning Fevers, efpecially in the beginning, while there appear as yet no figns of concoction, we may purge by the example of Hippocrates, 7. Epid. 1. 178.

¶ P. Martianus comm. in aph. 22. 1. does not explain the word *ὑγρῶν* by a wandring and uncertain motion of the Humours, for this reafon, becaufe upon giving a Purge at that time they are ftirred up more, with danger, that they will rather fall upon fome part than be excluded out of the Body. Which opinion is the more likely, becaufe it is obferved by the beft Praditioners, that fuch unruly motion of the Humours is rather allayed by Bleeding than purging. See the title *de Sang. mif.* above, and *Pharos medicorum* l. 4. § 29. But hear Martian upon the word *turgent*: Whether you refer it to the Body, or the Humours, the difpofition of the Humours is intimated, whereby, feeing they are fixed in no part of the Body, they yield a fignification concerning themfelves fometimes in one part and fometimes in another: But the name of *orgafm* is not, I think, derived, as Galen fuppoles, from the Humour's being often moved to and again through the Body, like animals that are incited to copulation; becaufe, though it be granted that *ὑγρῶν* is borrowed from animals excited to copulation; yet it is not upon the account as they are moved this way and that way, but becaufe their *puenda* are turgent; which Aristotle hath noted l. 6. de hiflor. animal. c. 18. which word Theophrastus ufed l. 1. de cauf. plantarum, to fhew the time when Plants begin to bud, faying that *ipfis gemmae turgent*, their Buds grow turgent, and yet the Plants are not moved up and down: in which fenfe Hippocrates alfo ufed it lib. de fract. com. 3. t. 18. and lib. de nat. pueri n. 20. Yea it hardly feems fafe to irritate by a Medicine the Humours when they are in a difturbance in the Body, and are moved up and down, to this and the other part: for Hippocrates 4. de morbis blaming thofe

Physicians

Physicians for the death of their Patients that gave Purges upon odd days, brought this for a reason, that on that day the Humour is disturbed in the Body: for, said he, if any do by a Purger yet more disturb the Humour that is already unquiet, no wonder that a man dies thereby: which danger though at length it be removed, yet purging in that case is rendred very doubtful; for as often as the Humours are disturbed in the said manner, seeing it cannot appear to the Physician to what part they will bend their force when the Purge begins to work, he can neither make choice of the way by which (according to the precept, *whither Nature bends*) evacuation ought to be made, nor prescribe a convenient dose of it, because 'tis requisite the Purge be stronger when the Humours are revell'd to a contrary part, than while their own inclination is yielded to. Wherefore I think the name of *turgency* rather agrees to them, because when the Humours are not fixed in a part, they signifie themselves to be somewhere, and the Patients feel a certain sense of *turgency* in that part, as if it were truly swelled. And this is often observed in practice; for when Patients feel that sense, they do of their own accord desire a Purge of the Physician. From this opinion therefore that Patients have of *turgency*, is this word translated to all those in whom the Humours are not fixed, so that they may be easily drawn forth by the Medicine, and herein we agree with *Galen's* interpretation: for when there is this facility of purgation, though there be present tokens of crudity, yet purgation is not hinder'd, but, if it seem otherwise necessary, it may be attempted.

The same facility of purgation *Hippocrates* thought necessary in Women with Child, lest the difficulty thereof should become destructive either to the child or mother or both. And therefore 4. *aph. 1.* Women with Child are to be Physick'd from the fifth to the seventh month, if there be *turgency*: Now if this *turgency* threaten'd the aforesaid danger, we should purge not only in those months, but in others also, because when a great danger is imminent, 'tis better to try an uncertain Remedy than none. Lastly, 'tis necessary there should be a facility of purgation, when the greatness of the Disease requires it, and the Faculties of the Patient are not altogether firm: Therefore *Hippocrates 1. de morb. mul. v. 232.* in the cure of a certain Disease having its rise from the suppression of the *Lochia* in a Child-bed Woman, durst not prescribe purging without *turgency*: for there he says. *If she have not her purgation, her Belly swells, as also her Spleen and Thighs, and she has a Fever: her pulse is weak, and sometimes acute, and sometimes it is high, and sometimes fails: thus it is in the beginning of the Disease; and in process of time see whether the parts of the face grow red: when it is thus, give light Meat, and if there be turgency, give her a Purge, &c.* As often therefore as the difficulty of purgation may bring some great inconvenience, *turgency* is required to make the purgation the more easie, but otherwise not.

VI. But we must consider that Nature may be *turgent*, when she is provoked not only by hot, thin and malignant Humours, but also when by many and cold: as *Hippocrates* teaches *1. de morb. mul.* who rehearses that a Woman may *turgere* through plenty of phlegmatick Humours: whereby it comes to pass that Nature often begins divers evacuations, and ceases by and by from her undertaking, and being weak and unable, desires and points to help; whereby, notwithstanding, inexorable Physicians are not moved, but only condemn them as symptomatick, and foretel the future danger, but do not at all prevent it; whereas *Hippocrates* hath often advis'd, that we must draw that way whither Nature bends; which opinion, besides shewing of the place that is fit for evacuation, insinuates also what Nature, who is the Mistress of Physicians, would have to be done.

VII. Whether *turgent* Humours be always to be purged off, *Cardan* doubts (*contr. 1. 1. tr. 6. cont. 14.*) because many things hinder such purging, viz. continual crudity, the use of thick and clammy Meats, obstruction, tension of the viscera, heat and inflation of the Hypochondres, Inflammation of the viscera: in which cases it is unlawful to purge without previous preparation, according to *Galen 1. aph. 24.* yet this opinion is repugnant to *Hippocrates* and *Galen*, who command to purge a *turgent* Humour presently without concoction; because the putting off purging, portends danger to life, and then all hope of safety is placed in hastening of purging. Indeed when there are many crude Humours in the first ways, and the other proposed impediments are present, we must purge with great premeditation: yet if the Disease be very urgent, it is better to use that Remedy, than to cast the Patient into danger of his life; for the harm that may be feared from Purgers, is to be preferred before death, as *Galen* commands *12. meth. 1.*

VIII. *Hippocrates aph. 22. 1.* says, that crude Humours are by no means to be purged, nor must we purge in *principiis*, in the beginnings: which is so to be expounded, not as if he excluded the beginning of Diseases as the unfittest time for purging, as the common opinion is; because this is so far from being *Hippocrates's* opinion, that he taught the clean contrary both by doctrine and examples. That aphorism is well known, *In the beginning of Diseases if any thing be to be moved, move it then: for when they are come to the height, 'tis better to be quiet: and he assigns a reason, for about the beginning and end all Symptoms are weaker, but in the vigor more strong.* And speaking more peculiarly of purging (*lib. de affect. vers. 29.*) Concerning the sick we must consider presently in the beginning, what thing they have need of, and what such things they are, as whether they should be purged, or you will do some other thing you have a mind to. But if omitting the beginning, when the Disease comes towards an end you give a Purge, the Body being now weakened, (perhaps being afraid to give any before) 'tis to be feared you will rather fail than have success. From whence we may conclude, that Purging is not only not forbid in the beginning, but of the two times wherein 'tis only permitted, I mean in the beginning and declination, the former is far to be prefer'd. And *Hippocrates* himself was so observant of this document, to purge in the beginning, that you will hardly find that he purged in acute Diseases when the beginning was over. Thus 4. *acut.* he bids us purge on the 4th day in a burning Fever; and after he says that it is to be done before the fifth. In the same place he appoints purging on the fourth day in the cure of a Pleurisie. In 3. *de morb.* he says that in a Peripneumony we must purge on the first, fourth and fifth days: In 1. *de affect. v. 267.* in a bilious Fever he chuses the 3d. or fourth day for purging; at which time he had order'd it a little before in the cure of a continual Fever. And 3. *de morbis*, in a Pleurisie he orders the Patient to be purged before he begin to spit thick Phlegm. Now by the word *beginning* we understand not the first invasion of the Disease, but all that time that is distinguished from the vigor, and from the declination: for this was the division of the times of Diseases that *Hippocrates* used, as we may gather from sundry places; but he signifies it to us most plainly in that *aph. In the beginning of Diseases if any thing be to be moved, move it then; but when they are at the height, 'tis better to be quiet: for about the beginning and end all Symptoms are weaker, but in the vigor more strong.* Wherefore in such acute Diseases as are not very speedily moved, the beginning is sometimes extended to the seventh day, so that a purge may be given even on the sixth. And this I would note, lest any, because *Hippocrates* has so celebrated purgation in the beginning of a Disease, should think that a Purge is to be given presently at the beginning, which I see many do, who

who at the first visit forthwith prescribe a Purge to their Patient, often before they can have any knowledge concerning the Nature of the Disease: from which importune way of cure many mischiefs use to proceed, that afterwards manifest the error of the Physician, while the Disease shews its self to be of the Nature of those that admit not of purging before Bleeding, a catalogue whereof Hippocrates makes, 4. *Acut. v. 28.* If such were under the Law of the Egyptians, they would often be call'd in question for their over hasty purging. Which danger that Hippocrates himself might avoid, he durst never (except in sudden and the most grievous Diseases) give a Purge till three days at least of the Disease were over, as appears from the above-cited places. Yea 4. *Acut. comm. 4.* concerning the cure of a burning Fever he speaks thus: *If it seem convenient to purge, do it not within three days, but on the fourth.* Seeing therefore Purging was so familiar with Hippocrates about the beginnings of Diseases, we cannot say, that in this aphor. he would exclude the beginning of Diseases principally from purging, when he said, *Nor in the beginning*; but that he meant, that even this time, that otherwise is the fittest of all for purging, is inconvenient whensoever there appear signs of crudity.

Martian.
comm. in
dist. aphor.

IX. Then may we give a *minorative purge* in the beginning of a Disease, when the pulses consist of great and small ones, or when there is an inequality of them: than which there is no sign more certain that the faculties are loaded.

Mercat. de
Fr.

X. At this day we observe purging to be much abused, and that there are infinite errors committed in it, while some think that the cure of no diseases is to be undertaken or performed without the use of Purgers, and that the health of the Sick is placed in often repeating these, without premising any appropriate Digesters, Resolvers or Openers: And so it happens by the undue administration and repetition hereof, no regard being had to the Faculties, that Diseases are rendred long, the Spirits exhausted, the Appetite dejected and crudities increased, from whence proceed a thousand mischiefs, as Vallesius l. 7. Ep. rightly admonishes us. Galen (l. 1. de hum. f. 1. con. 12.) taxes these inconsiderate attempts in the Physicians of his time also, that they were only solicitous about evacuating the Humour, without any consideration had of the strengthening of the Parts: for thus he says, *Whence we may see a common Error of Physicians which is generally committed in most Diseases: for they evacuate indeed what is superfluous, but never propose to themselves to take any care that the like to that which is evacuated may not be bred.* Whence also Poterius (Cent. 1. cur. 2.) grievously inveighs against such Physicians, calling them Tom-turd-men and not Physicians, far worse than Empiricks, and not differing from Mountebanks, Fortune-tellers or Juglers.

Frider. Hof-
man. m. m.
lib. 1. c. 7.

XI. Purgers are commonly distinguished into those that Purge the *first* region of the Body, which they say is on this side the Liver, and reaches from the Stomach to the middle of the Liver, and comprehends all the parts and ways that lie betwixt these two; and those that purge the *second*, which reaches from the middle of the Liver to the habit of the Body, and comprehends the upper or gibbous side of the Liver and all the greater Veins; and those that purge the *third*, which comprehends the habit of the Body, that is, all the Muscles, with the lesser Veins, membranes and other things. But Helmont's opinion is reasonable (in his book called *Demens Idea* § 20.) to wit, The first region is the Stomach and Guts with all the vessels contained therein; the second where the circulation of the Blood is made, that is, in all the Veins and Arteries; the third, where the Blood is extravasated.

Joh. Walaeus
m. m.

XII. It is false, that all extravasated Humours cannot be evacuated: 'Tis true indeed of the thick,

but not of the thin, which are signified if they yield to the impression of the finger: wherefore there-fore the Blood circulates, there I can also evacuate: yea purging is convenient also in the cavities which seems to be a fourth region, as in the *Abdomen*, Breast and Brain (and this experience teacheth) though there be no circulation of the Blood there- in. ¶ Galen (13. meth. 9. l. art. med. 95. and in other places) grants that Humours that are without the Veins in the habit of the Body, may return into the Veins again. The matter is clear by examples: Hippocrates 5. *aph. 65.* disallows of tumours that vanish all of a sudden. Small Pox and Measles from the coldness of the ambient air, from densation of the Skin and repression of the Humour retire to the inward parts. When an Humour is fixed most firmly in the outer parts, from whence a *Talpa*, *Natta* and other venereal tumours use to arise, it is waisted by the force of a strong Purge, as of *Stibium* or *Pulvis Vigonis*, or by the application of a Mercurial ointment.

Walaeus m.
p. 39.

XIII. Hippocrates 26. *vers. l. 4. At.* says that by giving a Purge in the beginning, Inflammations are irritated and not helped. Which saying hath produced many difficulties in art concerning the cure (universally taken) of Inflammations, and no small abuses in Medicining; seeing 'tis certain that Hippocrates himself very often used purging in Inflammations, as the principal Remedy, making no mention of Bleeding: Thus in this same Book (f. 2. 6. 64.) he orders purging in the beginning of a Pleurisie instead of Bleeding, when there is a pain below the midriff, which yet cannot be there without inflammation. To pass by innumerable places in the Book de *morb. Aff.* and others, wherein the Cures of Diseases are treated of, where he teaches that Inflammations infesting divers parts of the Body are cured only by Purging. To this difficulty I answer with the learned Vallesius; Although Inflammation, as it supposes multitude, do primarily indicate bleeding, yet sometimes Cacochymie does so prevail over plenitude, that for the sake thereof purging is to be preferred. Therefore when a pain extending it self to the Hypochondres intimates a great Cacochymie, omitting Bleeding he advises purging. In like manner l. 2. de *morb.* in a Pleurisie he prefers purging, if the Patient be choleric by Nature and unpurged, for in that case there must needs be a Cacochymie. And the same is to be supposed to happen in other Inflammations that Hippocrates would any where have cured by purging; whether it happen on the account of the part affected, which is apt to receive a Cacochymie; as for instance the Womb, in the Inflammations whereof Hippocrates commonly preferred Purging before Bleeding; or on the account of an evident Cacochymie, as has been said of Choleric persons, that have fallen into a Disease unpurged: nor need we in such like cases fear the inconvenience that Hippocrates in the fore-cited place teaches to happen by purging in the beginning of Inflammations; because as often as in acute Diseases (of which he there speaks) there is a great Cacochymie, it is for the most part a Choleric, which because of the thinness of the Humour is not so fixt in the part as utterly to resist a Purge, as Blood does; and if it do not yield to the Purge, the healthful parts are not colliquated thereby, seeing the Veins are full of the same Humour, upon which the Medicine acting touches not the sound parts, but by drawing the Cacochymie out of the Veins becomes a revulsory Remedy to that matter by which the Inflammation it self is fed, and that being drawn out, that which is fixt in the part is the more easily concocted and digested: which revulsion by purging has no place indeed in those Inflammations wherein there is plenitude, and not Cacochymie; which although it be in the part inflamed through transmutation of the Blood into a Choleric juice

G g g g g

by

by the heat of the Inflammation; yet because it is constricted in it, it yields not to the Medicine; and the Humour that is in the Veins, is Blood for the greater part; whereupon the Medicine cannot act; wherefore it must needs be turned to the sound Parts and colliquate them, as Hippocrates says. As often therefore as the *genus venosum* abounds not with such naughty Humours as may be drawn by a Medicine, and that those which are in the inflamed Part, are so fixed therein that they will not at all yield to it, those inconveniences must needs follow that are reckoned up in that place. The knowledge whereof is derived indeed from many things, but chiefly from the Urine, which if they be thin and crude, indicate that the matter is fixed in the Part, and that there are no Humours in the Body that can be drawn out by a Purge, in which case we must abstain from Purging: but by no means if the Urine be thick or cloudy, for when these are present in any Inflammation, we must betake ourselves to Purging from the beginning. The present saying is therefore to be thus interpreted, That we must not (as some do) persist in its universality, so as that we should always abstain from Purging in all Inflammations whatever. Nor is Hippocrates condemned by receiving this Exposition, because he pronounced it universally; for he tacitly hinted that exception, when he added the reason of his Opinion, *For a Disease that is as yet crude, yields not, &c.* As often therefore as the Humour contained in an inflamed Part is of such a Nature as will yield to a Medicine, or finds an Humour in the rest of the Body which it may draw and carry forth, a Purge being taken colliquates not the sound Parts, nor is the Disease increased.

P. Martian.
comm. in l. c.

XIV. Some are of opinion that there is no need of such great strength of the Faculty for Purging as for Bleeding: but not meddling with other mens Judgments, I think that a strong evacuation by effective Purgers requires greater strength of the Faculties; because when such a Medicine is once given, it is no longer in the Power of the Physician; because it self also has a virtue that is adverse to the Body; and because Purgation is not performed without great commotion of the whole and dissipation of the Spirits. And though some, *where Hippocrates says that vacuation may be made even to swooning, apply it to Purging, yet I believe it has only place in Bleeding. For who could adventure to Purge even to swooning without rashness and danger of life, seeing none can promise himself that Purging shall proceed to swooning, and yet not tend to Death, inasmuch as there can no restraint be laid upon Purgers that can bridle their excess?

* Aph. 23. r.

r. or l. Inst.
Med. diip. 19.
3. 4.

XV. How can Purgation be performed at the beginning as often as the Urine shall be thick and cloudy, though there be no Concoction of the Humours, which yet is so suspected with thinness of the Urine? I answer, As often as the Urine is thin, it is a sign that nothing of the morbid matter is expelled with the Urine, either because it is thrust into some Part, and so closely fixt, that no portion thereof can be separated thence, which mixing with the Urine might make it thicker; or because Nature being intent upon the concoction of it, holds it so closely as to let none of it go from her. When therefore none of the noxious Humour is spontaneously expelled, it is an evident sign that it is so rebellious as by no means to yield to a Purging Medicine. But on the contrary, when thick Urine is made, it is a sign that a portion of the morbid matter is expelled with it, and this indicates that the remainder of it, though not at all concocted, yet is so disposed that it will obey a Purging Medicine. Yet it is to be noted that Purging is not always convenient as often as the Urine is thick: because, when this crassitude proceeds from Concoction begun, 'tis by no means lawful to purge, lest the concoction begun be disturbed; and this we discern,

because it appears not at the beginning of the Disease, but afterwards, and of thin becomes thicker by degrees: for in this disposition of the Humours, we must abstain from Purging. But when there is turgency, crudity hinders not Purging; as Concoction begun does: And therefore when the Urine shall be thin at the beginning, and afterwards shall become thicker by degrees, then it signifies that Concoction is begun; wherefore we must abstain from Purging, till there appear signs of perfect Concoction. Likewise when there ensues thickness of Urine in Fevers either from the colliquation of the Humours, or from malignant Putrefaction, or the like preternatural cause, neither is Purging good in that case. ¶ Hippocrates forbade that Purges should be given where there are no signs of Concoction in the Urine; now he gives the Reasons, explaining the harms that arise from unseasonable Purging; Namely, if you Purge unseasonably, the Urine will not be concocted, and the crises will not be made in due time; but both being taken away, I mean, Concoction and Crises, the Fevers will be lengthened: Quite contrary to what vulgar Physicians expect, who, when crudity of the Urine lasts longer than they would have it, presently Purge, thinking that Nature that is not able to concoct so much matter, will be better able to overcome it when it is made less, and take care to Purge their Patients before the Critical day, and therefore most on the sixth day; to the end namely that Nature may better perform the Crisis. But they are deceived, for Nature is then only made more powerful over the remainder by evacuation, when evacuation is made rightly and according to Art, as when a Pletthory is lessened by Bleeding, or Purging is performed because of turgency; otherwise there is nothing that can more hinder Concoctions and Crises: for those things are not evacuated that ought to be, but a great deal of good Humours is drawn forth, the bad are only stirred, by the stirring retention is disturbed, which being taken away, Concoction must needs be so also; and by the taking away of this, a fit expulsion and crisis is also taken away; because it is the order of the natural Faculties, that the retentive should minister to the concoctive, and when Concoction is finished that the work of the expulsive should succeed; otherwise all things will be done unseasonably and tumultuously, and therefore without benefit. Hence you will easily understand (which not a few admire) why, seeing the Ancients so much esteemed the Crises of Diseases, and writ so many things of them, so few occur in our days: Certainly this is the reason, because the most are unseasonably Purged, and unseasonable Purging takes away seasonable Crises.

Martian.

Aph. 23. r.

XVI. As to the universal times of Diseases, we must know that evacuation is granted in the beginning, when the Humour is not as yet confused; but in the state and declination seldom; and not but by gentle Medicines: for if you administer a strong Purge in the declination, you will confound anew the Humours that have been already separated, and will make the sick relapse.

Valles Comm.
in lib. de viat.
Acut. p. 206.

Walaei m.
m. p. 27.

XVII. According to Trallian, Vacuation is not to be put off when there are any signs of Concoction: for thick Humours are over-concocted, and through their thickness become unfit for expulsion.

XVIII. As often as the whole mass of Blood abounds with a watry excrement, it ought to be freed therefrom by degrees, the evacuations of the same being often repeated both by Stool, and especially by Sweat or Urine; I say especially by Sweat, because all evacuation by Stool does more disturb and weaken the Body, than by Sweat, especially when water is to be evacuated, because that uses not of its own accord to tend towards the Siege, but to the Kidneys and Pores of the skin. For as Choler

is evacuated no way more commodiously than by Stool and Vomit, and not so by Urine or Sweat, so watry Humours are most fitly expelled by Urine and Sweat, and not so by Vomit or Stool: But pituitous and acid Humours seem to be conveniently enough expelled both ways, both by Stool and Vomit, and also by Urine and Sweat. If any desire to know the reasons of what is here said, I will give the following, and 1. *Choler* is therefore carried off more conveniently, easily and happily by Stool and Vomit than by Urine and Sweat, because it self is poured forth pure, and comes only to the small Gut, (and not to the Heart and the whole Blood) from whence it may be easily driven upward to the Stomach, and also downward to the thick Guts, and so be evacuated: But the same *choler*, when it is mixt with the mass of Blood from whence it should be separated, sticks closer to it than that it can be expelled out of the Body by Sweat and Urine, nor can it any more be parted pure from that mass. 2. As to watry Humours, as they are rather loosely confused in the mass of Blood than intimately mixt with it, so they may be easily separated therefrom, so that they may be expelled out of the Body as well by Urine as Sweat: And because water superabounding in the Blood according to Nature uses to be separated with the Urine, and not by stool, 'tis no wonder if the same may also by Art be more easily expelled by Urine and Sweat, than by Stool or Vomit. For though the Pancreatick juice, as also the saliva may from thence acquire a more fluid consistence, and so also increase the liquidness of the Humours that flow to the Guts; yet there seldom happens by this means and way any notable spontaneous evacuation by Stool of the watry part of the Blood, but pretty often by Urine and Sweat: And so also is an artificial evacuation of the same water more conveniently and easily attempted by Sweat and Urine, than by Stool or Vomit. 3. Thin Phlegm, such namely as has its origin from the saliva, may not only be easily drawn forth both by Stool and Vomit, but also by Urine and Sweat, because it is not so difficult to separate from the rest of the mass of Blood: And the more tough and clammy can be conveniently drawn forth no way, till it be sufficiently incited and attenuated; but then though it may be more plentifully carried off by Stool or Vomit, yet it may not inconveniently be drawn forth also by way of Urine and Sweat, which then uses to come forth more thick and clammy: which is a certain Argument that those ways are not unfit for the expelling a clammy Humour also. Lastly, an acid Humour, as it wants to be temper'd and corrected before it can be expelled any way; so then it may be most conveniently cast out by Stool and Vomit, inasmuch as when it abounds in the Pancreatick juice, it here finds a very short passage: but the same may no less conveniently be expelled by Urine and Sweat, because those volatil Salts that do easiest and quickest correct and temper it, do withal carry the same to the passages of Urine and Sweat, seeing all of them are Sudorifics and Diuretics.

Sylvius Pract.
L. III. cap. 9.

XIX. Among the Humours that differ from the mass of Blood, there is every where mention of a melancholick Humour, which they declare commonly to be of an earthy Nature. As far as I have been able to judge from an accurate and long observation of the Patients I have had the care of, and from a laudable evacuation of the Humours that produce the said melancholick Distempers, that is, by happily curing the said Distempers, I have noted two sorts of Humours on which those Distempers depended, not a little differing from one another, to wit *sour*, and very clammy Phlegmatick, partly by correcting, and partly by draining forth whereof, I have happily cured the said Distempers; wherefore I have thought that both ought to come under the notion of a melancholick Humour. And this di-

stinction is not to be slightly esteemed by Physicians that will practise, seeing if this be neglected, you will hardly ever cure Melancholicks as you desire: yea I am fully perswaded that melancholick Distempers are therefore so seldom happily cured, because most Physicians do not sufficiently observe that distinction, being too much addicted to their Authors, and over-neglectful of those things that happen in Practice. Now we must even for this reason attend to that distinction, because the same Medicines cannot always be profitably used both in the alteration, and especially in the evacuation of these two Humours: for *sour* Humours are best altered and corrected by volatil Salts and all the milder Aromatick plants; but the glutinous, also by acid Spirits, which do further corrupt and render hurtful the *sour*. So *sour* Humours are very happily evacuated by Hydragogues commonly so called, but the glutinous by Phlegmagogues. Whence any one may easily see of how great profit, yea necessity this distinction is for the right practising of Physick, seeing it brings great light both for the knowing and curing melancholick Distempers; as those will confess, who being employed in their cure shall compare what others have said and writ of this matter, with what I have. Therefore two kinds of melancholick Humours, require two sorts of Medicines to Purge them: To draw out the Phlegmatick, especially the glutinous, these are good, Ind. Myrobalans, Polypody, Dodder of Time, Senna, black Hellebore, LAPIS LAZULI, and LAPIS ARMENUS: To Hydragogues belong SOLDANELLA, the Berries, Seed, middle Bark, Root and Leaves of Dwarf Elder and Elder; Mechacan, Jalap, the Root of Flower-de-luce, Hedge-hyssop, ESULA, MEZEREUM, ELATERIUM, Gum of PERU and Crystals of LUNA.

XX. A Salt Humour is presently to be Purged, according to Galen l. de const. Art. because it cannot be concocted, for Concoction supposes crudity to be concocted, but a salt Humour is concocted, yea adust; wherefore those are presently to be Purged that are troubled with a salt distillation.

Epiph. Fer-
dinand.

XXI. The Purgation of acrimonious Humours should rather be indifferent than minute, for by small dribbling Excretions of acrimonious Humours it often happens that Dysenteries are caused.

Mercat. de
Indic. Me-
dica.

XXII. I think it adviseable, when a principal Part is ready to receive the matter, to withdraw it by little and little if it may be, and not to take care to keep it all for one Critical evacuation, but rather to prevent Crises by Art, as is often done.

Valles comm-
in lib. de
vict. acut.
p. 203.

XXIII. I began to find fault with that common error of our vulgar Physicians, when they bid us drain all the *choler* out of the Body: for from hence there ensues this mischief, that by taking away the principal condiment of Concoction, many have lost all appetite to their Meat, then have become Cachectick, and at length have died Dropsical. One man had three Sons that died Consumptive, which being dissected there was not a drop of *choler* found in the Gall-Bladder, though the viscera were unhurt: wherefore I laid all the blame upon the Diagridiate Medicines that had been frequently given.

Morbis ex
Anonym.
fundam. Phy-
siolog. c. 16.

XXIV. When *choler* offends, let the Dose of Purgers be small in the beginning, lest the *choler* that is very fluxile of it self, and turgent in a manner, should grow furious and produce a *cholera morbus*, or at least a great *Diarrhea*. For unless it appear that Phlegmatick and tough Humours do withal abound in the Body, in Purging of *choler* it is always safer to use Cholagogues in a less dose, and that for fear of superpurgation. Add, that though when Purgers are given in a less dose, they perhaps evacuate nothing, the same may be repeated, and the operation of the former promoted by giving others after a few hours, also in a small dose: which same thing, where there is no urgent necessity, may be done the next day only, seeing

seeing Purging Medicines have not only a vertue to evacuate vitious Humours, but also to alter and correct the same, and to prepare them for a fit expulsion. Now I diligently commend this precept to younger Physicians, &c.

Fr. Sylvius
Pract. l. 1.
c. vij.

XXV. Where there is a tough Phlegm, water hinders the operation of any Purgers: on this account Purges are most conveniently prescribed in the form of Pills; because Gums may be easily put in them which are the fittest of all Medicines to cut tough Phlegm, and are not easily dissolvable in any liquor; and thus at once the offending Humours may be both alter'd and expell'd. As for example, Take of Gum-Ammoniac, or Galbanum, &c. Prepared with Vinegar, half a Drachm, of Mastich a Scruple, of trochisc. Albandal, the resin of Scammony of each twenty five Grains, mix them, make twenty five Pills, of which give five or seven in the Morning with some Broth.

Idem.

XXVI. An acid Crudity will be cured by giving Medicines that temper or concentrate an acid Spirit; carefully abstaining from Purgers before the acid Humours are temper'd and brought to the nature of serum, which then being superfluous may easily at length be drawn forth by Hydragogues.

Idem.

XXVII. Though Spring and Autumn be the Principal times for evacuation of Humours for Preservation; yet let us Purge every one indifferently either in the Spring or Autumn, but let us see what every ones Nature and the Diseases that they are subject to indicate. For those who abound with thick Humours, are to be Purged in the beginning of the Spring: For such Humours being collected in the Winter are liquated or melted in the Spring time, whence unless they be evacuated, they may be easily diffused over the Body, and create great Diseases: But those in whom there are thin Humours, do well endure Purging in the end of the Spring, lest those Humours be inflamed in the following Summer and cause Fevers. When the Autumn draws on, acrimonious, salt, adust and scorbutical Humours are to be expelled, and that is the fittest time of evacuation for such as are distemper'd by tartareous Humours.

Erid. Hof-
man. m. m.
lib. 1. cap. 7.

XXVIII. Whether may we Purge on critical days? I answer, if there were no indication before, we may Purge on the 4. 7. 11. 14. and 20. day and also Bleed, for they will not prove Critical: But if these days be like to be Critical, we must observe whether Nature be about to attempt an evacuation on those days or no: If she make a perfect evacuation, let the Physician do nothing: But if she make an imperfect Crisis, mind whether she do it by Vomit, Sweat, Hemorrhage of the Nose, Fundament, or Womb; and then indeed we may assist vomiting with a gentle Vomit, Sweat by chafing, Bleeding by fomenting with warm water, or with Leeches; for these are in our power and may be stopped: But if Nature attempt an imperfect Crisis by Stool, it will be better for the Physician not to assist this motion, lest there be made a greater evacuation than is fitting, seeing a Purge once taken cannot be recalled, nor can we remove it: For Nature has this custom, sometimes to move leisurely at first, and by and by more violently. Wherefore it will be better to Purge the next day, that that which is left by the Crisis may be expelled. But if Nature be hindered from making any Crisis on a Critical day, if the matter be mitigated by (Pepasinus or) Concoction, let the Physician use Purging or Bleeding, if he know for certain that Nature will not do it. But you will say, according to Hippocrates, that nothing is to be moved on a Critical day: but he is speaking of such a day as Nature moves in, for the Faculties are wearied on that day by the force of the Symptoms.

Hieronymus l.
de febr. c. 14.

XXIX. That the influence of the Stars has great efficacy upon our Bodies, because of the circuit of the

whole terrestrial Globe and evaporation of moisture, seems to be intimated by Hippocrates 4. Aph. 5. In and before the Dog-days Purging is difficult. Indeed in our more temperate Climates there needs not so much scruple as in Greece, nor need we be so fearful of the barking or biting of the Dog: yet this curiosity is not to be altogether slighted, nor its foot-prints to be worn out.

¶ Fr. Bencius, who was the chief Physician in Italy of his time, (as Menardus relates it l. 2. Ep. 1.) never observed any thing of the Heavens; but as often as opportunity urged, he prescribed both Purging and Bleeding in the very conjunctions of the Sun and Moon, looking more upon the Urine than upon the Stars, and observing the beating of the Arteries rather than the configuration of the Stars: Whence it came to pass that being concerned in the Cure of a Person of Quality together with Hieronymus Manfredus, a famous Astrologer of Bononia, and there happen'd to be at the same time a necessity of Purging and a Conjunction of the Luminaries, the Astrologer gainsaying, and prognosticating Death to the Patient, Bencius order'd a Purging potion to be given, by which the Patient recover'd of his great Sickness.

Rolanc. l. de
febr. cap. 85.

¶ In the year 1643. in the Dog-days, about the beginning of August, three Children of two or three years old, being Purged with gentle Medicines by the Physicians that had the care of them, died convulsed the same day: Two of them were troubled with a Catarrh falling on their Breast, and the third with a Dysenterie. Other Children also from a Catarrh fell into Convulsions at the same time, and died the same day. Now these kind of Epileptic Convulsions are caused by the Humours that are colliquated by the hot Air. Hence it appears that we must use great caution in Purging the Sick in the Dog-days, according to the Precept of Hippocrates.

River.
Cent. 3.
Obs. 5.

XXX. Whether are Purging and Bleeding good in the Full or New Moon, as Hippocr. and Avicenna perswade? I answer, Though Galen observe not the change of the Moon, and the rising and setting of other great Stars, yet this indication is not to be therefore pretermitted, seeing it is of great moment and approved by the Experience of very grave Authors. For seeing we observe that the Moon and other Stars produce great changes in these inferior things, without any notable change of the first qualities that they induce upon the Air and our Bodies, it is clear that the indication taken from hence is not to be neglected; whence you will gather that at some times, when we would make some evacuation for prevention or in a mild Disease, we must abstain therefrom, if so be there be nothing urgent that may require the hastiness of a Remedy.

¶ Some shun the Full Moons, the Conjunctions, Quarters, and other states of the Moon in Purging: If such Observations can be made without detriment to the Patient, let a respect be had to those states: but if the Disease be urgent and there be present indications for Purging, mind them not, seeing Experience testifies, that Purges being given in the Change, Full or any Quarter of the Moon, have caused no mischief.

Zacut. intro.
it. ad Pra.
Præc. 48.

XXXI. In Summer and Winter we must not take Physick for Prevention; for in the Summer the Faculties are weak, the natural heat being drawn from the Centre to the Circumference by the external: in the Winter the Passages are strangled by the cold and the Humours concentered. Hence Avicenna 4. 1. admits not of Purging when it is extraordinary either hot or cold; for cap. 5. l. c. he says, when the greater Dog-star arises, and when Snow lies on the Mountains, we must not use Purging. But let the Physician consider the rising and setting not only of the Dog-star, but also of the Lyra (or Harp) of Arcturus, the Hyades and Pleiades; and let him carefully

Maneph. l. 2.
de febr.
p. 297.

fully observe the Solstices, Equinoxes, Conjunctions of the Planets, motions of the Moon, Eclipses and bad Aspects of the Planets; but yet not so superstitiously as some, who think it a heinous crime to give a purge when the Moon is passing through the ruminant signs of the Zodiac: for the partition of these signs according to the parts of mans Body is phantastick, against reason and experience.

XXXII. When we would purge for prevention, the Wane of the Moon, is to be chosen: for though in the increase of the Moon purging may be quicker and easier, whilst the Humours being then fluxile are more prepared for evacuation, yet it is not safer; but because there is fear lest the Humours being moved should rush Head-long into the Guts, and there should ensue a superpurgation, or boiling too much should flow into some other part of the Body; and because in the increase of the Moon the motion of the Humours that is made toward the circumference of the Body, is contrary to that which is caused by the purging: but in the decrease the Humours tend to the inner parts and follow the motion of the Medicine.

XXXIII. Note that before the Moon comes to a Quartile of the Sun (if there be no malevolent planet present) Purgers though gentle, do work more vehemently yet without impairing the faculties. Which is to be well observed in the Humours that have taken deep root, which are not otherwise easily extirpated by Purgers, even the strongest. The same thing falls out in the new Moon.

XXXIV. On the contrary we must abstain from all purging Medicines in the conjunction of the Moon, or its Quartile or opposition with Jupiter, Mars or Saturn. For seeing in all purgation there precedes a certain fermentation of the Humours, Jupiter through his gentle and slow operation does either retard it, or at least lessen it: and in all violent aspects of Mercury, viz. Quartile or Opposition, we must not rely on purging, because the Symptoms of the Head are apt to be raised thereby, as Vertigo, falling-sickness, &c.

XXXV. If the moon shall be in a Trine or sextile with Venus, it will be good to evacuate boiling Humours tinged with sulphureous dross; if with the Sun, the cold and moist; and if with Jupiter, the adust and tartareous. Nor is Jupiter to be excluded here, who is hot and moist, especially in the Wane of the Moon, and therefore he also makes towards the expulsion of tartareous Humours.

XXXVI. All these directions are of force, when we would purge only for prevention; but we may purge at any time when necessity urgeth: for if the vehemence of acute Diseases be urgent, or there be a turgency of Humours that arises about the Dog-days, which cannot be cured without Bleeding or Purging, certainly they are not to be omitted: for Hippocrates said not simply, that we must not then purge, but only that purging is difficult.

XXXVII. It is doubted also whether we must rather purge in the increase or wane of the Moon? I say it is more secure to undertake it in the wane; because although the Humours be fluxile in the increase, yet this motion that is made towards the Skin, is contrary to that which is raised by the Medicine; but in the decrease the Humours tend to the inner parts and follow the motion of the Medicine. (See § 32. before.)

XXXVIII. The dose of a Purger is to be found out by experiment; for the propriety and condition of Bodies is various: we must therefore ask the Patient whether he have taken a Purge at any time when he was sick, and whether it wrought enough and according to desire, or not. If you understand that the Patient was very easy to work upon, then use the more gentle Medicines, or

in a smaller dose; but if he had but few or no stools, then use stronger, measuring the dose of the Medicine in regard to the temper of the Body. Moreover the more or less apt to be soluble his Belly at present is, the Medicine ought to be stronger or weaker. But if a man have never been purged before, we must learn how dry or moist his Belly is, that by taking our indication thence we may the more certainly measure the dose of the Medicine.

¶ We must note what every ones peculiar Nature can bear, for all bear not the same Remedy alike: for some Bodies contain the virtue even of the most powerfull Medicines; others are wrought upon by the weakest: therefore the cure is always to be begun with the weaker, both that Nature may be accustomed to Medicines, and the sense of the Patient may be found out.

¶ If the Physician be unacquainted with the Nature of the Patient, namely whether he be easy or hard to Purge, Spigelius bids us mind the Patient's Feet, and to gather his easiness to be purged from the length of them, and his hardness from their shortness; which indeed is something, seeing they are weaker: but the whole truth consists not herein. Others bid us consider the breath of the Patient, which if it be gentle and delicate (unless the Patient be Melancholick) intimates Purgation to be easy. It is best to ask the Patient whether he use to go every day once or twice to stool; if he say yes, he is easy to purge; if no, difficult.

XXXIX. Many wonder why I prescribe purging for three or four dayes together, seeing most hitherto have been content with one day: I answer that three or four gentle purgings are to be preferred before one strong one; for on the first day they will purge the first region, that is, the Stomach and Guts; on the second they will evacuate the Liver, and open its obstruction and stuffing; on the third they will cleanse the Veins which are indeed the Store-house of that colluvies that causes Diseases and Death: This manner of curing does insensibly destroy inveterate evils without hurting the Parts, yea they are rather strengthened by this slow depletion; which evils the more vehement Medicines with all their violence and perturbation cannot remove, and which the Ancients left as incurable.

XL. When Purging does not follow upon Medicines that are not very weak, there is reason to fear lest the excrements being moved, and not evacuated should be carried into some noble part, and there cause some worse Distemper.

¶ Purges given in too small a Dose do more harm than good, and they do nothing else but attenuate the Humours; and these being attenuated, when through the defect of the just Dose of the Medicine they cannot be expelled, rush all the Body over and disturb it.

XLI. Those err greatly who always begin their Cures with Purging: Those Expurgators think upon nothing but driving vicious things out of the Body, as if the matter were to be done by the hand and nothing could hinder: they are not content with that Minorative Purgation that is never to be parted with, which they always undertake in the very beginning of the Cure, at all times of the Disease; but they would every day abuse a Purging Medicine, if the Patient would obey every day, without any respect to Concoction or other Preparation: These forsooth think all that the Ancients have Philosophiz'd concerning Concoction, to be mere trifles: They only look at those things which pass out of the Belly, and the worse those are, they think the Patient is the better treated, whereas in the mean time they colliquate the Bodies of many: These truly are not to be suffered.

XLII. Of

XLII. Of those who are not Purged by a Medicine, some are not much hurt, in whom namely nothing more is done but either the Medicine is too much conquered by the Concoctive Faculty, and so being distributed with the Aliments turns to nourishment; or being not enough deduced into act, it passed out downwards: Others are hurt very much, as having the Excrements drawn to some inward part that is affected, or moved and roiled all the Body over. ¶ Those who labour under Diseases of some Parts depending on some vicious matter, are then most helped by Purging when a Cacochymic of the whole Body feeds the Diseases that are in the Part: But when the Humours are already fixt in the Part and the rest of the Body pure, we must rather trust to particular Remedies, and a good Diet, and the benefit of time; for the Bodies of such, as being sound, indure Purgings ill; and that which is impacted in the Part, yields not: whereby it comes to pass that many of them are hurt with Purges, because the Faculty is weakened and the Disease remits not.

Vallef. com.
in c. l. p. 505.

Martian.
com. v. 246.
sect. 3. l. 2.
de morb.

XLIII. Symmachus's Son being suffocated by choler in his Sleep and seized with a Fever, and not keeping a Purging Potion when given him, was neither Purged in six days, nor before he died. ¶ This Person seems to me to be therefore not Purgeable, because there was a redundance of Choler and it was carried upwards; and I think this was the very cause of his Death, that Choler seized in abundance on his Head and Heart, and there was no place for Remedy. But how can it be, that redundance should hinder purging, for it seems apt rather to cause too great evacuations; and doubtless it was that which hindered the retention of the Potion? When this Person was suffocated in his Sleep by the multitude of Choler (which shewed that much of it was carried towards his Head, and that it abounded in the upper Parts that are about the Breast and Head) and kept not the Potion that he drank, nor was purged, it is reasonable to think that the redundance of the Choler in the upper part of the Stomach hindered the Medicine from being kept; and when retention and traction was taken away, that Purgation was also taken away: What therefore was to be done by the Physician in this case? Certainly he was not to rely on one strong Medicine, but evacuation was to be made by degrees, by often repeated Vomiting.

XLIV. I know that in Sickness Hippocrates was often wont to purge the Humours by the region which was farthest off from the part affected. Thus lib. 2. de morb. in the Disease called *Siccatory*, that was like an Hypochondriacal Distemper, he first begins evacuation downwards, and then finishes it upwards; the contrary whereto 'tis clear he observed in Distempers of the Head; for in that case he first vomits, and then purges downwards: the reason of which difference depends hereon, That evacuation is to be begun at that part that is next to the part affected, so that in Diseases that infect the parts below the Midriff, we must begin with purging downward; but with Vomiting, if the Disease possess the upper parts: But this is to be understood when the Disease needs both evacuations.

XLV. The vulgar way of purging *per Epicrasin* (or by gradual purgation) does not please me, when they give a Purge on every fourth, fifth, or seventh day, or once a week: for this way the Medicine will only on the first day carry forth what is contained in the first ways; and before the second Purge come, the same excrement will be collected again in the same ways; and it will fall out in like manner before the third and the rest; whereby it comes to pass that the virtue of the Medicine reaches not to the part affected which we intend to evacuate. Wherefore 'tis fitting we should purge without intermission, that at least the

second, third or fourth purgation may reach the place affected, and may lessen the matter of the Disease: by which manner of purging many are more happily cured of the greatest Maladies, than by any other Remedy. Hence in Diseases of the Head, Breast and Lungs; in Diseases of the Joynts; in inveterate obstructions, madness and other distempers purgation *per Epicrasin* is more safe and profitable than any other: in which distemper it is fitting every day for 7. or 8. days together to take some Purge, that what is situated and stufft up in the more hidden and inward parts, may be exhausted by degrees, and that without hurt to the faculty.

XLVI. Hippocrates 1. aph. 22. says, that crude Humours ought neither to be moved nor Purged. Under the word *moved* he comprehends not every motion, for then it would follow that during the crudity of the Humours, neither a Vein should be opened nor a Clyster injected, which is repugnant to his Doctrine: therefore he meant that commotion which is brought upon the Humours by the purging faculty of Medicines, whilst they are placidly drained out of the Body: as if through the lenity of the draining such evacuation deserved not the name of purging. Nor is it a new thing that this word *moved* should be restrained to purging only; for Hippocrates used it in that signification 3. *Politic. cap. 2.* In Egypt, says he, after the third day Physicians may move; if before, they do it at their peril: and perhaps he rather used this word than another, because they used to purge lightly about the beginning, which is customary in our times: whence the more modern Physicians distinguishing the Medicines that cause such light purgations from the stronger, have called them sometimes Lenients, sometimes Minoratives: & Hippocrates called these same sometimes light Purgers, sometimes Subducents, sometimes looseners of the Humours, as we may gather from his Books of Practice: which if most later Physicians had well read, they would not have boasted that such Medicines were unknown to him, by which pretext perverting the whole Doctrine of purgation, they have brought the matter to that pass, that no precept nor distinction is observed about the matter of purgation: for they presently give their Minoratives to all without distinction, finding fault with those that by a convenient distinction do sometimes abstain from them.

Pr. Martian
com. in dict.
aphor.

XLVII. 'Tis worth noting that heaviness of the Body, whether with a Fever or without, does indicate purging, as intimating plenty of Choler, which hath settled in the Veins and joynts, as Hippocrates says lib. de affect. yet in such as have no Fever it requires bitterness of the mouth to be joined with it, because otherwise it may have another cause. Yet this will seem strange to vulgar Physicians, who as soon as they find a sense of heaviness in Fevers, presently come to Bleeding, thinking this to be the certainest sign of a plethory, being taught by Galen lib. de plenit. c. 2. But they are deceived, as appears by the authority of Hippocrates, and as daily experience confirms; and as we clearly observed in the Fevers that went about in the year 1622. whose chief symptom was gravity of the whole Body, and especially in the beginning: now Choler was so predominant in these, that not only all the excrements appeared bilious, viz. their Vomits, Stools and Urine, but also all the other Symptoms, want of sleep, Head-ach, deliriums, bitterness of the mouth, yea and breakings out or pustules most of them of a yellowish colour: whence we thought their chief Remedy to be purging, omitting Bleeding.

Idem comms.
in v. 142.
loc. cit.

XLVIII. Purgers, in those Diseases wherein Nature is wont to have no crisis, such as are some long continued Fevers, some internal Inflammations, the French-Pox, the falling-sickness, Vertigo and other like, may be safely given in the augment and state. Therefore I adhere not to their opinion that affirm that

Hot. Aug. n. that we must never purge but in the end of the state or beginning of the declination.

XLIX. A young man of a Sanguin complexion, after Bleeding, and preparing potions, took in the morning an easie purge made of Rhubarb, *Diaphanicon*, with the Syrap of fumitory and *Senna*: After two hours he was oppressed with a great pain in his Belly, which was eased by having two stools: after an hour he went five times to stool very plentifully, but did so burth with an inward heat that he thought his Bowels were burnt up: there ensued a very high Fever, an unquenchable thirst, a cruel pain of the *Mia*, so fierce that it interrupted his breathing and voice. The Physicians are called, they apply Anodynes to the pained part, prescribe lenient Clysters, apply Cupping-glasses and other diversions to the Thighs; but all in vain, for the pain raged more. I am called also, and advise Bleeding, for the faculties held out pretty well: all are against it, for two contrary motions are not to be celebrated on the same day. But seeing the cruel pain increased, necessity compelling, my advice was follow'd: being bled the pain was eased and the Fever remitted.

Zacut. Prax.
adm. I. 3.
Obl. 8.

L. 'Tis an unreasonable custom with most Physicians to administer purgers without distinction in all Affections raised from wind: as we commonly see in Hypochondriack Melancholy, and in those who suffer great pains of their Head or Stomach, or *nauseas* and subversions and such otherlike Symptoms from wind; wherein that we may purge without mischief, we must distinguish whether the pain or any Symptom arise from wind, which a weak faculty may not breed, whilst the matter keeps a mediocrity in quantity and substance; for whilst it does so, and yet *status* are raised which cannot be dissolved, 'tis a sign that the weakness of the faculty is more in fault than the matter: at which time 'tis a great error to use purgers, and is forbidden by *Hippocrates* 4. *Ac.* 1. 115. For by them the natural faculty is further weakened and dissipated, and so through impotency generates much wind of any matter, as we generally observe in Hypochondriack Melancholy, where the faculties must needs be weak, and the Humours disobedient to weak Medicines, and yet they are made ungovernable and more malignant by the more vehement: whereby it comes to pass that such Patients are worse by these, both because these Medicines neither purge *status* nor take away the Disease; and also because they weaken the faculty and make it the apter to breed wind. But if wind arise rather by the fault of the too thick matter than from weakness of the faculty, I think it most adviseable to use Purgers. Wherefore if *status* be generated in the Stomach or other part through weakness, I think it safer to use strengtheners and dissolvers than Purgers.

Mercat. de
Ind. Med.
L. a. c. 6.

LI. The ingenious diligence of some hath invented a conjunction of Narcoticks with Catharticks: for though it be confessed by all, according to *Galen's* opinion, that sleep stays all evacuations except those of sweat and the Seed, and that Narcoticks hinder the operation of Purgers, and therefore are a present Remedy for an *hypercatharsis*: yet it is found out by experience, that after a gentle sleep caused by a Narcotick, the innate heat being collected in that time, there follows a most successful exclusion of Humours, by virtue of the Cathartick joyned with the Narcotick. ¶ In a vehement pain of the Stomach *Alideus* in *Forelius* mixes purgers with Narcoticks, that the pain may both be allayed, and the offending matter withal expelled. Take of *Diaphanic*. half an ounce, *Philonium Romanum* two scruples, with the water or decoction of Chamomel make a potion. Also in the Colick *Riverius* (prax. l. 10. c. 105) prescribes this: Take of the best Aloes a drachm, of Laudanum Opiati four grains, of *Diagradium* six grains, mix them, and make pills to be given at a conveni-

Alex. Deed
Valeud.
p. 17.

ent hour: they allay the pain in an hour, and afterwards evacuate the Humours.

LII. A Sudorifico-cathartick Diet-drink is a decoction that provokes sweat and withal evacuates by stool. It is an invention of Modern Physicians, and hardly used a few years ago, yet not invented without the hope of very great benefit: seeing by the help hereof the thinner part of the Humours being resolved by sweat, the thicker that remain, which otherwise use to stagnate stubbornly in the Belly and other parts, are by this means profitably eradicated withal. Nor need any exclaim against divers and contrary motions; for the natural heat, that is the instrument of the excretive faculty, together with the expulsive bears it self indifferently to all motion or situation, and when the Medicine twitches or draws, rises up to the expulsion of the moribick matter by all the ways that are open, as experience confirms.

Sylloge obf.
84.

LIII. Some deny that Lenitives ought to be mixt with Purgers, for instance, *Cassa* with Agarick, because Lenitives are *to genere* less powerful than Purgers and of a slower operation; therefore some first give Lenitives alone, and then Purgers by themselves, namely with such a distance of time betwixt as they think may bring them to work at the same time. But they are deceived. For those Medicines that are only Lenitives, seeing they do not purge, but by their slipperiness and glibness carry down the Humours, have no proper time of operation: but if there be any other thing, joined with them that may excite the Belly quickly to excretion, Emollients pass by speedily; if not, slowly: therefore being mixt with Purgers, according to the virtue of these they will pass through quicker or slower, and they will go before softening the ways, and by their slipperiness gently drain forth, what the Purgers shall attract, which was the only benefit that was expected from the mixing of these together.

Vallef. cons.
l. 9. c. 41.

LIV. Purging is kindred, either because the Medicine is not dissolved because of its solidity; or because the natural heat, especially of the Stomach, is so weak as not to put it into act; or from the same weakness the expulsive faculty is not strong enough to move the Humours. Hence is a reason gathered why Elective purgers that are strong and given in a large dose, sometimes purge less than those that are weaker: for the stronger the Medicine is, the stronger it requires the Natural heat to be whereby it may be deduced into act. There is another reason, why many Purgers, and given in a large dose, sometimes work less than a few; namely because they are overwhelmed by the multitude of Correctors and Alteratives that are mixed with them: for every *menstruum* designed for extraction, draws out as much as it can; and so it ought to be proportioned and specifick with respect to the matter to be drawn forth. So that, though, (for instance) you infuse a whole ounce of *Senna*, adding many Correctives and Alteratives, you will have a less effect than if you drunk an infusion of two drachms only in wine: understand this of infusions and extracts: for nothing acts beyond the bound of its activity.

Hoefst. Med.
Med. l. 7.
c. 2.

LV. A late way has been invented by some Moderns of injecting Purgers into the larger Veins, and communicating them to the Heart and whole Body by means of the circulation. *P. I. Sachs* hath given us the experiment and manner of administration in his *Oceanus Microscopicus*: through a pipe made of Larks bones, the one end fitted to an oxes Bladder, the other inserted into the *Vena mediana*, or some fair Vein of the Foot, is a purging liquor poured in; by squeezing the Bladder: when the liquor is injected, the hole is stopped: thus the liquor is communicated to the Heart, and a purgation follows in a little time.

LVI. *Bertrandus*

LVI. *Bertrandus Rozius* in *Saler.* c. 129. transfused into his Wife the force and vertue of a Medicine with his Seed. I remember that the same happen'd to a Noble Man at *Orlean* in *France*; who lying with the Wench that brought him some gruel an hour after he had taken Physick, insinuated into her the efficacy of the Medicine, so that she was purged violently ten times upwards and downwards.

r. Dan. Horst.
obl. Anat. 10.

LVII. Purgations as they are sometimes necessary, so where they are frequent they bring danger; for by them the Body is used not to be nourished, and for this reason it will be infirm, seeing infirmity is most obnoxious to all Diseases. *Celsus* l. 1. c. 3. Besides these things which *Celsus* writeth, Purgers drain moisture from the Body, whereby the Body is wasted and old age is hastened, and the Belly also becomes cōstive through dryness. Wherefore *Galen* 3. aphor. 15. If any one fearing lest many excrements should be heaped up in his Body, do use Purging twice, or at least once a Month, besides that he will bring his Body to an evil custom, he will also weaken it, &c. And *Avicenna* l. 1. f. 3. doct. 2. c. 1. Physick purgeth and inveterates: Which is chiefly true of the stronger Medicines that they used in that age, and that many use in ours, whilst they take Antimony, &c. Nor signifies it any thing what some say, that they take only a few grains, because seeing it is necessary that the Medicine be such as to overcome the inward heat, and not to be overcome by it, (for then it would not purge) it is necessary also to infer that there is the greatest contrariety betwixt such Medicines and Nature; and the fewer grains will do it, the greater must be the contrariety; and the more frequent the use of them is, the more is nature hurt.

Rubeus
comm. in l. c.

¶ We must sometimes abstain from the use of Purgers, though the body be foul; for some bodies, if they should be purged for a whole Month, would never be pure. Sometimes nature is sustained even by an impure blood, which happens in the cachectick and phthisical, whose life is sometimes prolonged for many years without Purgers.

Crato apud
Scholtz.
Epist. 13.

LVIII. Before purging, if the disease grant Truce and time, the humour is to be prepared and the ways to be opened. Thus it happens in burning Fevers, as also in melancholick diseases, that the excrements of the Guts are sometimes so dried in them, that they wholly stop up the way for carrying the humours forth: and unless you remove this stoppage by a Clyster, or correct it by adding a Laxative, what you do is to no purpose. It is sometimes necessary also to fence the Intestins, not for fear they should be corroded by the acrimony of the humours, for this is seldom done; but because some Medicines by their caustick vertue may hurt their coats, such as *Vitriolum Martis* and others.

Waleus m.
m. p. 40.

LIX. It is the best to give a purge in that part of the day wherein the vertue of the Medicine cannot be intringed; which is when our stomach is empty: Excepting resinous Pills, and some Medicines that are apt to run together in the stomach, and therefore have need of some liquid for a solutive (I know that sometimes sixteen grains of the Rosin of Scammony have been given to a child-bed woman, which yet for the said reason have not at all loosened the Belly) and of lenitive Medicines that require some chewing, as *Manna*, *Cassia*, &c.

aleus m.
an. p. 38.

¶ I have commended purging Medicines taken a little after meals, but in a less quantity, and with an intent to procure but few Stools; but the same are not to be given in a large quantity, and for the procuring of many stools in a short time: for in such case I would have them taken on an empty stomach. We must therefore distinguish both between Purgers (& sudorifics) when used in a less quantity, and which may serve in the place of Alteratives when they expel nothing; and the same given in a

larger quantity, for the performing of a notable evacuation in a short time: for nothing hinders why those may not be mixed with aliments, but these not so.

Sylv. de le
Boe Append.
tract. 4. §
245.

LX. Though according to *Ægineta* l. 7. c. 6. in all thorough Purgations we must give the Medicine fasting, and when concoction is perfectly over: yet we must note, that in the *Picrocholi* or such as are of cholerick and rare natures, that fall into a Swoon or *Cardialgia* through the acrimony of a Medicine and the confux of humours to the stomach, it is safer before the taking of the Medicine to give some aliment, which yet for its small quantity may not very much employ the digestive faculty, and may strengthen the mouth of the stomach that is very sensible, as broth of a Pullet, or Ptisan with the juyce of Pomegranats; or give a mouthful of toasted Bread moisten'd with wine, as *Avicenna* 4. l. c. 1. §. 1. advises.

G. Horst. in
instit. disp.
p. qu. 8.

XLI. *Hippocrates* l. de Hum. v. 4. amongst the hindrances of Purgation reckons up emptiness of the Bowels, by means whereof the Medicine that is given to purge, comes to be attracted by them, so that the purgation goes not forward. On the same account, *lib. de purg.* v. 30. he has condemned purging in strong Fevers, because their flesh and Bellies being hot receive the Medicine, and they are nothing purged; wherefore what the Febrile heat is the cause of in this case, is in the former attributed to emptiness. Whereby the unprofitable diligence of some Physicians is condemned, that prescribe fasting at even to those that are to take a Purge the next morning: not minding that the contrary is commanded by *Hippocrates*, who would have Bodies to be disposed for purging by much Meat and Drink: for so the Humours being diffused by the Meat and Drink, do the more readily yield to the Medicine, and the danger is avoided of the empty Bowels drawing the Medicine to them. Yet I deny not but that too much satiety is to be avoided, especially when the purgation is to be made downwards, lest the stomach being full do more difficultly sustain the Medicine: for *Hippocrates* says in the same Book, that the repletion of both the lower and upper parts of the Belly forbid purgation, yet emptiness does it far more.

com. m. l. c.

LXII. Not only before purging (which *Hippocrates* seems to have commanded, *aph.* 9. l. 2. when one will purge Bodies, he must make them fluid; and there being divers ways to make a Body fluid, this by previous Clysters is not to be despised) but also after it, for deterging the remainders of the Humours that sometimes stick to the Guts, it will not be unprofitable to inject a slight and deterging Clyster, as the best Physicians advise; for the injected Clyster rinses the Guts as it were, and takes away the harm that was left by a stronger Medicine, especially if it were of that sort that have Scammony in them; for that by its acrimonious faculty uses to hurt the Guts: and there is the same reason of all the more violent Medicines.

Primiros.
Err. popul.
l. 4. c. 20.

LXIII. If thick Phlegm be to be purged, *Colocynthis* is most profitable, and *trochisci Albandal* made of it, as also *Hermodystils* and gummy Turbith, with an addition of *Merc. dulcis*. For, that I may note this, in pituitous Humours, and indeed in thick Phlegm, all Mercurial Medicines are good, but not so in *Cholerick*, for in these, *Antimonials* are deservedly preferred, and may be conveniently made use of for all Humours.

Sylv. de le Boe
prax. lib. 2.
c. 22. §. 62.

LXIV. 'Tis very doubtful and uncertain to guess at a fit time for giving Purging Medicines: The Physician is often ignorant of the motion and organ of Nature; whence, when she is preparing her self of her own accord for the expulsion of noxious Humours, if the Physician being ignorant hereof give a Purge, the Patient is cast into danger of his life. A Matron took a decoction of *Senna* with

with Prunes for her usual preservation, whereby was caused so large a purgation that it degenerated into a dysenteric that was then popular, which killed her three days after. Though it may be that great looseness might have happen'd without taking any Purge, yet when matter is stored up, it may be stirred up and compelled to expulsion upon the least irritation.

LXV. Hippocrates forbids Purging to them that are very much troubled with Pains, till the Pain be either allayed, or at least abated; because there is danger lest the Humours being moved by the Medicine, should through the vehemence of the Pain be rather drawn to the pained Part, than expelled by Stool by the virtue of the Medicine. A Precept that is neglected by most Physicians to the destruction of men, yet every where observed inviolably by Hippocrates, as we may see l. 1. de m. mul. f. 3. v. 148. l. 2. f. 3. v. 303. de int. f. 2. v. 29. and in many other places: for he first appeases the Pain, and then Purges.

LXVI. If a Physician prescribe to a Woman with Child any Medicine that Purges hastily, the force of Nature will cause an Abortion: Pills are the longest of working, next to these, Powders; then Electuaries; but the quickest of all are Potions: We must therefore give to Women with Child Pills, or the more gentle Powders not long before meal.

LXVII. If one intend to Purge a melancholick Person, unless he add Looseners, he shall not obtain his end. A certain Practitioner gave a Purge to a melancholick Person three or four times, and yet purged him not at all. An old Woman coming advised to take a Decoction of Senna with Prunes. He that would Purge a Phlegmatick Person, will find it necessary to add stimulating Medicines. A noble Lady, fifty years old, wanting a Purge, consulted me; and tells me that she was not moved even by the strongest Catharticks: that another Physician had often try'd to Purge her in vain, who had prescribed her, as she said, what would have Purged an Horse: She was strong, and her hair black and curled: I advised her to take before Supper six Drachms of Elect. Cathartic. with half a Drachm of Cream of Tartar in the form of a bolus: whereby she went six times to Stool, nor did she afterwards make use of any other Cathartick, having always the like success with it.

LXVIII. When both Phlegm and Choler have transgressed their natural bounds, Choler is never to be Purged strongly neglecting the Phlegm, for the Phlegm is warmed by the heat of the Choler. I have known some die of an Apoplexy by having the whole Oeconomy of their Body inclining to Phlegm through the long-continued and much use of Rhubarb and Manna; for Choler and Phlegm temper and bridle one the other. All things in the great World would grow stiff with frost, if they were not cherished with the heat of the Sun; now what the Sun is in the World, the same is Choler in the Body.

LXIX. N. N. minding to Purge his Body when the Spring was drawing on, taking a violent Purge there was presently a translocation of the Humours made into his right Foot (which before was weak by having indured a vehement cold) which Humours by their malignity and plenty suffocating the weak heat of the Part, brought upon it a sudden Gangrene. Hence you may learn that it is dangerous to attempt with churlish Medicines Bodies that are filled with impure Humours, and are either weak by Nature, or have been made so by some external accident. A Minister, though in health, would needs take a Purge, whereby his Humours were presently so disturbed, that he died in a few days after: for when naughty Humours are wanting, these Remedies disturb the good. See Aph. 2. 62. and 16. 4.

LXX. In compounding of Medicines we must

see (according to Hippocrates 2. Ait. l. 11.) that they be all *homogeneous* of a like condition, such as may exert their Vertues in an equal space of time; with a like distinction of the Faculties, and a like force; so that one may not make haste and go before, and another linger behind: for by that means there will be perturbations and tumults in the Belly, Humours will be stirred up and produce grievous Symptoms: As if for thick Humours you give the Pods of Senna with the Seeds of Anise and wild Carrot, and add to the liquor after you have strained it, Syrup of Roses: for such Syrup brings forth the Senna and leaves the thicker matter and makes it more stubborn. Hellebore and Myrobalans endure not one anothers company. Such things as bring violence upon the Body, ought not to be detained long in it, wherefore they are not to be mixed with astringents, but rather with other things that Purge briskly.

LXXI. The Stomach is very much hurt by Hellebore and other violent Purgers, especially its attractive Faculty: Whence it comes to pass, that whereas naturally it ought to attract Aliments, being imbued with the evil quality of the Medicine it draws to it self vicious Humours and such as are agreeable to the vertue of the Medicine, and is readily filled with them; wherefore unless thenceforward he be Purged again by intervals; this vicious attraction of the Stomach is the cause of many Diseases.

LXXII. Walaeus (m. m. p. 40.) commands the Body to be moved up and down when we take a Purge: for, says he, all rest, or sleep, even in the beginning, hinders Purging. Yet I know that Purgation is hindered in some if they forsake their Bed, and that the effect thereof is forthwith intercepted by that means: Namely, the warmth of the Feather-bed conduces to the fusion and colliquation of the Phlegm, and to its exclusion out of the Body.

LXXIII. I do not disallow of warming Purging potions before we drink them, for so they seem sooner to begin their Operation and to be reduced into act. But yet they may no less conveniently be drunk cold in the Summer time, by such as have an hot Stomach: For very many Purgers that enter the composition of these Potions, do not so well endure boiling, and their vertue exhales by a gentle heat, at least is dulled in part: as appears in Rhubarb, which is made more sluggish if it be set on the fire; as its Extract teacheth, which is made first by infusion that draweth forth its tincture and vertue, and afterwards by gentle drying is reduced to the consistence of an Extract: for some Drachms that are sufficient for several infusions, are hardly enough for one Dose of the Extract, because by drying the infusion the Cathartick vertue vanishes also. Add, that a cold Potion is both more grateful, and is better retained by the Stomach.

LXXIV. It has been the opinion of some that cold water should presently be drunk after having taken a Purge: Bourdelotius a Parisian Physician, endeavoured to introduce this Custom in the North, because he believed that the vertue of the Medicine was thereby increased and promoted; and the malignity of Medicines corrected. I could not consent to his opinion, because amongst our Northern People the Stomach is not so hot, that it has need of a cooler upon taking a Medicine: We should rather advise hot drink, that we use to give after an hour or two, if the vertue of the Medicine be more sluggish.

LXXV. Nothing is more pestilent or calamitous than to feed too freely after the Purge has done working; because Concoction and Distribution are vitiated, for Nature hath sustained the force of a disturbing Medicine, whence she is become languid and dull; and also because perhaps you tyed him to short commons before he took it. If there-

fore you shall let him eat freely now, his Belly will be stopped, and there will follow a confusion of all the Vessels; and the first Concoction is not amended by the second: Therefore presently after the Purgation allow but a little, and afterwards more by degrees.

LXXVI. Whatsoever nausea is raised by any Purging Medicine, chew a Wall-nut Kernel immediately upon it very well, and it will presently go off.

LXXVII. It was usual with the Ancients to omit their Dinner on that day they took a Purge, or Purgative Clyster, as we may collect from divers places of Hippocrates. It is not indeed to be affirmed that this was done without reason, for it was for fear Purgation should be interrupted by the Aliment that was taken: for by taking Meat, perfect Purgation is interrupted, which is perfected by fasting following: for though a Purge draw forth Humours from all the Body, yet the lower Belly is more evacuated than other Parts, though in Progress of time all the Body be equally emptied. Wherefore if one eat presently after Purging, before the emptied Belly draw from the Body, complete evacuation is hindered, wherein the perfection of Purging consists: whence our Physicians offend in this, that they grant a Dinner on the Purging day, so that it is no wonder if perfect Purgation very seldom follow.

LXXVIII. From which rule later Physicians beginning to depart, began to give Broth to some instead of a Dinner, that they might avoid a total fasting: And hence, if I mistake not, came the use of giving Broth after Purging: But our Physicians, retaining the use of Broth, do an hour after it allow a Dinner with a double error, and that often in the middle of the Purging: an evident sign whereof is, that they are purged after Dinner, so that the Purgation was not finished before.

LXXIX. On the day that any takes a Purge, let him refrain from Salt, or from Broth that have any Salt in them, upon a twofold account, 1. Lest he be made more thirsty than he can well endure, according to that of Hippocrates 54. Aph. 19. *Whoever having been Purged are not thirsty, are not at quiet till they be so*: 2. Lest there be caused a superpurgation, for Salt doth excite Nature being dulled, and keeps the Belly loose; so that it is to be feared, lest on the Purging day, by adding a spur as it were, it should increase the Purgation.

LXXX. Whether shall a man sleep or wake after he has taken a purging Medicine? If the party have a strong, hot and brisk Stomach, there is no necessity of sleeping; but if his Stomach be weak, sleep is to be granted, because according to Hippocrates 6. Epid. s. 6. text. 3. the Blood in sleeping retires inward, whence the inner Parts become hotter, and thereby the Purge will be better brought into act.

LXXXI. We know that there is a perfect evacuation when the Excrements that come out last, are contrary to those that came out before: As for instance, If a Cholagogue Medicine be given to any to Purge choler, when pituitous Excrements come forth after bilious, we know that there has been a perfect Purgation: Which my self having sometimes observed in Purgations, I have foretold the term of the evacuation to the Patients with admiration.

LXXXII. When we are sensible that the Purge any one has taken is too strong, it is a very great Remedy to drink a good deal of water hastily, and before it is settled in the bottom of the Stomach to force it up again.

LXXXIII. I know that for the prevention of Diseases, whether the upper or the lower Parts of the Body be in danger of them, Hippocrates did so abstain from Purging by Stool, that I know not that he ever purged any that way for prevention, but al-

ways by Vomit, as sufficiently appears 1. de insomniis & 3. de dieta, where he treats of the prevention of Diseases: Contrary to the custom of our Moderns who make all their preservative Purgations downwards.

LXXXIV. Nothing is more pernicious in Chronical Disempers than to macerate the Body with many solutives: which though they may seem to benefit at the first, yet in time they destroy, cast down the strength of the Members, especially of the natural, like as Snow when it falls upon standing-Corn, helps somewhat, but at length destroys it wholly.

LXXXV. After all Purgation Aetius bids us give two Drachms of the seed of Mallows finely powdered, to moisten the dried Belly.

LXXXVI. When you would Purge a melancholick Person, add Looseners, otherwise you will miss of your purpose; if a phlegmatick Person, then things that are pungent.

LXXXVII. If a Purge work not in four or five hours, advise stirring about: if there be no Fever, give two or three Pills of Aloes, salt Broth, half an Ounce of white Tartar finely Powdered in Broth, or a common Clyster. Gal. & Paulus give Adstringents.

LXXXVIII. Galen (lib. de cur. rat. per sang. miss. c. 7.) lays down a fourfold difference of healthful Persons that have need to be purged in their health for prevention. The first are those whom for some years by-past some Disease has invaded by intervals, as the Gout, Falling-sickness, Palsie, Stone, Hypochondriack melancholy, &c. The second are those who have been afflicted with some great and fearful Distemper, (as the French Pox, an inveterate Itch or Scab, the Leprosie, Scurvy) which yet was not confirmed by reason of the cure that was used. The third sort have neither been afflicted with any Disease often, nor with any that has been great and incurable, yet are disposed to a Disease by some habit that they have hereditarily contracted: for instance, the seeds of the Gout, Phthisick, Falling-sickness, Stone, &c. or the very structure of their Body, or the strong intemperature of some Part hath made them liable and easily subject to Diseases. In the fourth rank of healthful Persons are those comprehended who have some usual evacuation stopped, as of the Terms, Hemorrhoids, or of some inveterate Ulcer; or a wonted flux is stayed, or some considerable Member is cut off. Which four sorts of Men, if they will consult for their safety and life; while they are yet in health, they must prevent impending Diseases, yet tarrying for some symptom of plenitude or sickness.

LXXXIX. Hippocrates (1. de vet. Medic.) bids the Physician to consider long and round Bellies; because by looking upon them it is easie to understand who are able to endure strong Purgations: For those whose Parts contained in the Abdomen are strong and well constituted, may be safely Purged; but on the contrary those that are slender and lean, cannot be strongly purged without danger.

XC. Let not compound Purgers receive into them Medicines that are of too thin parts, as Camphor, for they carry to the Heart and to the most secret parts of the Stomach the purging Medicine which is under the genus of poisonous things.

XCI. Hippocrates (1. de sal. dieta) says we must Vomit the six Winter months, because that Season is more Phlegmatick than the Summer, and the Diseases incident therein are about the Head and the region that is above the Midriff: But when it is Summer and hot, we must use Infusions that Purge by Stool, because that Season is estuous, and the Body cholerick, and the Loins and Knees are loaded, yea and heats arise, and there are gripings in the Belly. He is wholly of a contrary opinion 4. Aph. 4. saying that in the Summer we must Purge the upper Parts by Vomit, and in Winter the lower by Stool: and

Martian. l.
de humour
v. 10.

Montan. conf.
21.

Walens.

Riolan. En-
chir. p. 65.

Rondeletius.

and *ibid.* Aph. 6. & 7. that those who are easie to Vomit, must be Purged by vomiting, yet not in the Winter; but those that are hard, by Stool, yet hardly in the Summer. *Galen* (*l. de sal. dieta com.* 15.) decides this difficulty, saying, When therefore Phlegm is generated in the Stomach in Winter, he advises us to purge Phlegm by vomiting; and when choler floats in it in the Summer, to draw it downwards: But if you intend to purge all the Body, you shall purge upwards in Summer and downwards in Winter, as is rehearsed in the Aphorism: For those who abound with Humours at present, are to be cured by Purging; yet so as that you purge by that way whither the Humours tend: but if you would hinder the increase of Humours, you ought to withdraw them by that way that is contrary to their natural tendency.

Mercat. de
ind. med. l. 1.
c. 9.

XCII. As much as may be, and the nature of the Disease will bear, use simple Purges: for besides that Nature dispenses not so well with compound Medicines, it is clear to all, that they often rather hurt than help: both because from all of them there neither always results one only form, that may act; nor can the Simples through confusion and repugnance of contraries always exert their virtues: whereby it comes to pass that they move, vex and irritate the Body, and either move those Humours that are faultless, or do not expel those that offend.

idem l. 1. c. 8.

XCIII. Note that there is a twofold Treacle, that which is but newly made, and that which is some years old, which hath undergone a due fermentation. The former has a Narcotick faculty, and may be given after a purging Medicine, when there is an over-great solution of the Belly, inasmuch as it alters that hot complexion thereof that is brought upon it by the Medicine; thickens the thin Humours; constipates the loosened Parts and makes them almost insensible. The latter is not convenient after a Purge, because it would more resolve the strength of the Body, would agitate the Humours more, would inflame more, and hinder the motion towards the lower Parts, in regard it moves the resolved matter to the skin.

Hort. concil.
iat. Enocl.
diff. 127.

XCIV. For the more delicate the Moderns have invented Clarified potions, that resemble the form of a Julep, and are not ungrateful to the taste. A double quantity of the Purgers is prescribed in them, because by the clarifying a great deal of their virtue is lost. Of these take this for an example: Take of Senna cleansed an Ounce, of Aniseeds a Drachm, of the leaves of Succory and Maiden-hair of each an handful, of Lykryrize sliced half an Ounce, boil them to ten Ounces. In the strained Liquor infuse of the best Rhubarb two Drachms, of Cassia newly drawn and Cathol. Dupl. of each an Ounce, of Tamarinds bruised half an Ounce, of Coriander seed a Drachm, of the Syrup of Roses an Ounce. Let them be strained and clarified according to Art, and make a Potion. Refer hither the Golden Syrup that is much used at this day, and is very grateful, made of the infusion of Senna, with the juice of Lemons, the cream of Tartar and Manna dissolved in it, and clarified with the white of an Egg.

River. l. 1.
c. 1. Pract.

XCv. Pills work more easily, as to the habit of the Body, in the fat, juicy well set and fleshy, because they are moister. But on the contrary, in general, whosoever have Guts that are more dry, Pills do not so well with them, because they need resolution.

Wedel. de
m. comp. ext.
p. 117.

XCVI. To bring out a viscus and acrimonious Humour, I prefer Pills prepared of Gums before all other, seeing these do both dissolve glutinous Humours, and dispose them to come forth the more easily. As for example: Take of Galbanum dissolved in vinegar of Squills and thickned again half a Drachm, of vitriolum Martis calcined to whiteness a scruple, of Trochisc. Alhandal half a Drachm, of Diagridium fifteen Grains, of the Oil of Caraway six drops, mix them, and make twenty five Pills and gild them. Take five or seven

of these in the morning on an empty Stomach, drinking some Broth or Gruel half an hour after.

Sylv. de le
Boc. Prax. l.
1. c. 35. §. 16.

XCvII. I purposely omit Aloes in many Pills that I prescribe, because it uses with trouble, and sometimes with hurt, to open the Hemorrhoids in many. Let the following Hydragogues be for instance: Take of Gum Sagapenum dissolved in vinegar and thickned again half a Drachm, of the Resin of Jalap a Scruple, of the Magisterie of Gummi Gotte half a Scruple, of the Oil of Juniper-berries three Drops, mix them, and make fifteen Pills. Let the Patient take five, more or fewer, as he is easier or harder to work upon.

Idem Prax.
l. 1. c. 35.

XCvIII. I admit of no determination of action in Purgation, nor do I grant any Election. Consult the most experienced Practical Physicians, inquire of the Sick and those that wait upon them, and all of them will say with one mouth, that always watry, thin and fluxile Excrements are first evacuated; next the Phlegmatick, and lastly the thicker, whether yellow or green, are brought forth by every Medicine. Moreover, which is more, if you go unto the Apothecaries Shops themselves, and there examine the forms prescribed by Physicians, you will often see that the most celebrated Physicians have used one and the same Medicine in purging many and divers Patients.

XCIX. Yet from hence it follows not, that any Purge may be used indifferently in any Distemper. For the Humours that require to be moistened, must have moistening Purgers, as the Syrup of Roses solutive, the Syrup of Senna, many sorts of infusions of Violets, &c. Those which are thick and ought to be incided, require Jalap, white Mechoacan, Scammony, &c. Nor matters it that Rhubarb evacuates yellow bilious Excrements, Emetics Martis aperitious blackish melancholick, and also that Flowers of Antimony do tinge with a Saffron colour; for it follows not from hence that the said Purgers do electively purge such like Humours: for we must know that these colours are not naturally in the Humours, but that they proceed from the Medicines, as the Flowers of Antimony tinge the Humours by their Sulphur, Saffron and Rhubarb heighten the yellowness of the Urine: And if some things have this faculty without the Body, to bring a certain colour upon things, why may not Purgers themselves being resolved have the same effect?

Frid. Hof.
man. m. m. l.
1. c. 7.

C. The Purgative Faculty of Medicines sometimes lies hid in the resinous Part, sometimes in the Salt: Hence Rhubarb, Agarick, Jalap, Turbith are very well extracted by the Spirit of Wine, and their Extract purges very well: But if you will extract Coloquintida, whose virtue consists in a Salt, you labour to no purpose, for it operates chiefly in substance.

Walcutt
291.

CI. The plenty of Medicines has made us poor. If you examine all the Purgers that Authors have collected, many of them are to be expelled out of that order, so that we shall seem to be reduced to scantiness: For there are some of them, that either through their sluggishness, or their vehemency are not to be used at all, or very seldom and with great judgment. The sluggish are Hyssop, Turpentine, Doader of Tyme, Polypody, Lapis Armenus, Lapis Lazuli, all which are to be expunged out of the Catalogue of Purgers; nor are Turbith, Hermodactyls to be admitted; though otherwise enough famed and cryed up: The juice of Violets does nothing. The too violent are black Hellebore, for it disturbs the whole Body; you may make tryal of it, by putting a little of the root of it in an Issue. The seed of the American Ricinus, Elaterium & Gummi Gotte may be used but seldom. May we not therefore at all use strong Purgers? I answer, that we may in two cases, namely in the Dropsie and Melancholy, &c.

Walcutt
met. med.
p. 47.

CII. Pur-

CII. Purgers (as I have known by long Experience) if they be mixt with aperient Medicines in a less quantity than may serve for Purging, so that the vertue of the Aperients prevail, do not at all move the Belly, yea their vertue, because it is of great activity, being turned to the passages of Sweat and Urine by the vertue of the Openers, does so increase the vertue of these latter, that both together make a most effectual Remedy, both to open, and also to provoke Sweat or Urine.

CIII. Whether may metallick Purgers be used safely enough for preservation? I like very well the desire of *Claudius Deodatus* in his *Panb. Hygiastic.* l. 3. p. 63. 6. that we would abstain from such as much as may be. For though there seem to precede a due and convenient preparation, yet it can hardly be, says he, but that some pernicious and poisonous qualities, wherewith the said Metals abound, should escape the hand of the most ingenious Chymist that prepares them, and so being taken within the Body, should, if not suddenly, yet in progress of time exert their vertue, and privily and by stealth prey upon the Nectar of our life: For, adds he, I have known but very few hitherto, that having used this sort of Purgers familiarly, have either come to a due and just old age, or have not contracted a Cachectick constitution of Body.

CIV. Vegetables need not always, like Minerals, a long preparation to open their *compages* or Body; for these often operate more strongly while the mixture is intire. For those, whose vertue consists in a subtil and volatil consistence, ought not with much labour and Chymical preparation to be reduced into Extracts, Magisteries or Quintessences, because most of them, as *Rhubarb*, *Manna*, *Cassa*, *Senna*, *Myrobalans*, &c. being reduced into Pills or Powder, or infused or boiled in a fit Liquor, do operate better and more easily; which being vexed with too much Artifice do either wholly lose their Purgative vertue, or exert it slowly and with trouble. It is usual, for drawing out the tinctures of Vegetables, to impregnate the Liquor they are infused in, with the Salts of Tartar or Wormwood, for so the infusion soon gets a deep colour. Though I do not condemn this Custom, inasmuch as the fixed Salts of Herbs effervesce with the acid juices of the Stomach and Intestines; yet we may detect the deceit that lies hid therein, seeing the Salts do not draw forth that deep tincture, but only cause it to appear: for if you add the salt of Tartar to an infusion of *Rhubarb*, *Senna* or other Vegetable that is already made and strained, its tincture or colour will presently become deeper. The reason whereof is, that the Saline fixt particles being very obtuse, do stuff the pores of the liquor so as that the beams of the light as they pass through, are very much refringed: and therefore any tincture being made deeper by the salt of Tartar, becomes presently clearer and thinner by pouring in some Spirit of vitriol, whose particles are sharp-pointed, without the precipitation of any matter. Yet however some of the Cathartick vegetables are mended by Chymical preparation: for such of them out of which (being full of Salt and Sulphur) the active and benign particles may be separated from the remaining more dull and malignant, and may be reduced into resinous, or other kind of compendious Extracts, I say a dissolution and new composition of these may be undertaken, to good purpose. Therefore for the due preparation of some Catharticks, we extract the Sulphureous and some of the saline part with the Spirit of Wine, as in the resinous Magisteries of *Jalap*, *Scammony*, *Mechoacan*, &c. For some we use saline Menstruums, &c.

CV. Yet I have met with some Instances of such as having taken such Spirit by the direction of a Physician, have been very ill upon it,

undergoing notable gnawings of their Stomach and Intestines, trembling of their Limbs, weakness of the whole Body and more than a two days want of appetite: The reason whereof in my opinion is, that the Purgative parts of the Spirit have returned by way of precipitation in the Stomach or Intestines to the former habit of their resin (especially if any thing was drunk cold upon it:) and the precipitated Particles sticking in the coats of the Guts, cause griping, and a weakening of the Faculties, whence they often create Swoonings, Convulsions and Tremblings, and, unless they be abterged in due time and their fierceness be dulled, super-purgations.

CVI. There must needs be some salino-sulphureous stimulus in Purgers, that may solicit Nature to excretion: for we observe that the vertue of Purgers is obtunded by Acids; which is a manifest sign that by this means their saline and sulphureous stimuli are infringed. Thus *Hellebore*, *Cologuintida*, yea *Antimony* it self, or rather its *crocus* and glass, are corrected and mitigated by the Spirit of Vitriol, or distilled Vinegar.

CVII. There are not a few, even Practitioners, who think that purging Medicines, as often as they operate not when they are taken, hurt very much: which Opinion I now laugh at, because Experience hath taught me the contrary, &c. For Purgers, if they be given duly, that is, in convenient quantity, time and measure, will always benefit, never hurt the Sick, though they do not presently purge out any of the offending Humours, for in such case they alter and correct them, and prepare them for a kindly evacuation afterwards.

CVIII. If *Choler* abound in the Body in the Spring-time, seeing it is to be feared lest by the following heat of the Sun it be poured too plentifully out of the Gall-bladder, and many Diseases arise hence, a Prudent Physician will lessen the choler, and that chiefly by Stool, as a more accustomed way and a more easie manner; but not by Vomit, unless in those that use to vomit and do it easily, who are commonly made to vomit even by Catharticks themselves.

CIX. That *Antimonium Diaphoreticum* hath a Faculty to open Obstructions is true; but it does not this of it self, but when it is mixed with Purgers: For it is certain that *Antimonium Diaphoreticum*, being joined to other Purgers, does increase their Purgative vertue (so that a less dose of them may serve) without any griping of the Belly: As for instance, If to half a scruple of the root of *Jalap* you add three or four Grains of *Antimonium Diaphoreticum*, it will work as much as if you gave a Scruple of the Root alone.

1. IF purging Medicines be given alone, they ought not to exceed the highest Dose: if they be given with others, if there be no fermentation, neither then is the Purger to be given beyond its highest Dose: But if there be a fermentation, we may exceed the highest Dose, because the Vertue of the Purgers is refringed by fermentation. Thus the highest Dose of *pilule fastidæ* is a Drachm and an half, wherein *Euphorbium* is given to fifteen Grains, whereas the highest Dose of it self alone ought not to exceed twelve Grains. But these Pills, unless they be fermented, are not to be given in this Dose. The *Hiera of Alexander* is compounded of Aloes, Agarick, Polypody, *Opopanax*, *Sagapenum*, *Hellebore*, *Coloquintida*, *Scammony*. But some make a doubt of *Scammony*: For *Alexander* adviseth when we give a Purge, to mix nothing with it for a *Stimulus*, such as is *Scammony*; for the Purge is rendred unprofitable by the *Scammony* or *Stimulus*: For when we would purge *Phlegm* or *Melancholy*, which matters are purged with difficulty, 'tis not beneficial that the Purge should presently be carried down into the Guts, but it is expedient that it stay a good while in the Stomach, that it may work more effectually, and its Vertue be the better distributed. I answer, If there be a fermentation, *Scammony* may be mixed with other Purgers, and so *Alexander* hath mixt it here: But if there be no fermentation of the Medicin, if it be given to purge a cold matter, then according to *Alexander*, nothing is to be mixed with it under the notion of a *Stimulus*: But if an unfermented Medicin be given to purge an Hot and Cholerick matter, we may mix something with it for a *Stimulus*; for when a Purge is hot, it is not good for it to stay long in the Stomach, but to descend presently.

II. Most of the *Arabians* affirm that Aloes opens the Orifices of the Veins: But *Dioscorides* says it has an astringent Vertue, and being drunk with cold Water restrains fluxes of Blood. *Galen*, (6. simpl.) says that it glutinates. I say that Aloes applied outwardly shuts the Orifices of the Veins, and so stops the Blood from issuing forth: But being taken inwardly, so as to penetrate into the Veins, it promotes the fluxion of the Blood: For being applied outwardly it has a condensing, astringing and glutinating Vertue; but the same taken inwardly, because it attenuates very much, makes the Blood hotter, and fuses it as it were. *Dioscorides* and *Pliny* say indeed, that being taken inwardly in drink, it stops a flux of Blood, but they speak of spitting of Blood caused by the opening of some Vein; for then it is instead of an external remedy, for being drunk it flows to the open Orifice of the Vein and shuts it, just as it does when applied outwardly to some wound. I omit Aloes on purpose in most of the Pills I prescribe, because it is wont to open the Hemorrhoids in many with trouble, and sometimes with hurt.

c. 13.

III. Whether does *Aloes* purge the whole Body? *Galen* (6. *simpl.*) places it among the Medicins that evacuate the *feces* or dung: The same Person (*Lib. de Theriaca ad Pison. Cap. 4.*) says it purges the whole Body; I say, First, Being taken in a small quantity, it evacuates out of the Stomach and guts; but in a greater, it draws from the whole Body. Secondly, Seeing the Distempers of the Head and upper parts commonly arise by consent from the lower, these latter being purged, the Head and whole Body become freed from excrements.

Zacut.
Phar-
mac. C. 5.

IV. Whether is *Aloes* an enemy to the Liver? *Pliny* L. 17. C. 4. *Paulus* L. 7. C. 4. and *Mesue* say that it helps the Liver: *Avicen* 14. 3. tr. 4. affirms that it hurts it. I say, *Aloes* hurts an hot Liver. *Galen* 3. n. r. c. 2. says that even washed it is very bad for those that labour under an hot and dry intemperature without vitious humours.

Idem.

V. Whether may *Aloes* be taken presently after Meat. The Author of the Book *de simpl. med.* ascribed to *Galen*, writes thus, Some after supper swallow two or three Gr. of *Aloes*, about the bigness of a small Pease, because it helps concoction, and corrupts not the Victuals. *Pliny*, L. 27. C. 4. If the Victuals be hard to concoct, *Aloes* is taken a little space after Supper. On the contrary *Paulus*, L. 7. C. 4. & 6. forbids *Aloes* after Meat, because purgation is hindered by the Victuals, and these are moreover corrupted by it. I say, *Pliny* gives it in a very small quantity to strengthen and help concoction; and the Author of the Book *de simpl. med.* orders only two or three Grains, which quantity may strengthen the Stomach, but cannot purge: If it be taken in a large quantity, it will offend the Stomach and corrupt the Meat.

Idem.

VI. Whether does it need correction? According to *Paulus*, L. 7. C. 4. it needs no other Medicin to be mixed with it to retund its ill quality; for it is a safe Medicin, and strengthens the parts: Yet *Galen* 8. n. r. c. 2. bids us add Mastic and Cinamon. I say, there is a double quality in *Aloes*, as bitter and an astringent; this latter is grateful to the Stomach, the former offensive and overturns it, and this *Galen* tames with Mastic and Cinamon. *Wede-
delius* notes concerning it, 1. That it is better extracted, for lenifying, by watry Liquors than by Spirituous: 2. That it operates better in a lesser Dose: 3. That it is better for drinkers of Beer or Ale, than for Wine-drinkers.

Idem.

VII. *Dioscorides* and *Serapio* teach that *Aloes* is to be washed; 1. For separating the earthy and gravelly part, for curing Distempers of the Eyes. 2. To take away its purgative Vertue, and increase its astringent. 3. To intend its Purgative. But washing is improperly spoken of pure *Aloes*; and to what end is the washing it with Water, and the drying of it by the heat of the Sun to be repeated? For what Vertue can accrew to it from the Water, by which it ought to be so often dissolved and dried again, if otherwise it be pure and pellucid? If it be defiled with *Sordes* or dross, I grant it is to be dissolved and strained, that it may become clearer and purer; but that is more conveniently done by the Spirit of Wine, which withal extracts its resinous and Balsamick part, than by Water; that leaves that untought; and then it will suffice to dissolve it only once, and to thicken it after it has been dissolved: For by those repeated solutions and inspissations the *Aloes* is not made better, but is rather destroyed after the manner of all purging Vegetables. I like that way best of all, when the *Aloes* (*Socotrina*) being powder'd, there is pour'd on it by repeated turns either the Juice of Violets inspissated with the Juice of Peach flowers, or the Juice of Roses, and the Juice is permitted to be dried away by a gentle heat. Those offend more that cast away the Liquor wherein the purest part of the *Aloes* is dissolved, and call that feculent part which they keep, washed *Aloes*. 'Tis true indeed, that this purges less than

that which is not washed, namely, because the best part is separated from it, the *feces* only being left with a small quantity of *Aloes*. ¶ This is that residence which *Helmont* rejects, when he says, that, that which remains from the washing, by its sticking to the Intestins causes Gripping, and the Hemorrhoids. *Aloes* consists of a resinous part and a watry: The former is unfit for purging, but this fit. Wherefore if you desire a purging *Aloes*, letting alone the resinous part gather the watry that will dissolve in the Water, and is separated from the *feces*.

VIII. *Aloes* is friendly to the Stomachs of old Men, not only because old Men are cold (for it has a drying and heating Vertue) but also because they are very prone to breed an acid crudity, which their acid sweats and other things shew: Now bitter things do best of all correct an acid crudity, and therefore also resist putrefaction. Yet in the meantime it is not to be given rashly to those that labour under a dry intemperature without vitious Humours, and have an hot Liver; especially the resinous part extracted by the Spirit of Wine; for this has a fiery heat as it were, it attenuates and dries very much, and makes the Blood hotter, and does not only not strengthen the bowels appointed for Sanguification, but hurts them by fusing the Blood as it were, and by being opposite to their Natural Constitution, and opens the Orifices of the Veins.

IX. Turbith and Agarick require Ginger to correct them, if thick Phlegm be to be evacuated; but they refuse it, if thin Phlegm, or the excrements of other humours that flow upon the Joints, be to be attracted and averted from the Joints.

X. The Seed of *Carthamus* does not so much purge as stir up flatul.

XI. *Cassia* does not, as most have thought, therefore loosen the belly, because it is soft and slippery, but because it has a peculiar purgative faculty, whereby it withdraws both Choler and Melancholy and thick Phlegm, not only out of the Guts, but also in great plenty out of the whole lower Belly; it is therefore good for the Melancholick to use it often.

XII. Let Meat be taken presently after *Cassia*, lest it pass into nourishment. a. Berberies take away its heat b; Aniseeds its windiness c: It is offensive to the Stomach and Guts when they are amiss d: It hinders any judgment to be made of the *feces* e: It causes a nausea f: It hurts the hypochondriacal, because it is naught for the Stomach and guts: It loosens the acetabula in Women with Child: It causes a prefocation of the Womb, as does also Manna g: It debilitates the ligaments in the Gouty. In vapid Distempers its correction with Citron seeds is not to be relied upon, unless the Spec. *Diarrhodon Abbatis* be added h: It sometimes brings on a Cataphora, as do also the compositions it is received into, through the fumes wherewith it fills the head i.

XIII. Those are not to be imitated that give it in Distempers of the Kidneys, and when they are foul, or when the Bladder is inflamed; for though it be gentle, yet it is a diuretick Medicin, calling forth the humours that it draws, to the Kidneys and Bladder.

XIV. Let it not be given to those that have an ulcer in their Reins or Bladder: Yet it is good for those who are troubled with the Stone, for being used for a continuance it withdraws the focus of the Gravel. It is not lightly to be given in the Gout, for part of it passes into nourishment, and so makes the parts loose and liable to fluxions. ¶ It is very nought for those that have used too much Venery, and thereby abound with crude humours, because it is flatuous and griping. ¶ *Cassia* through laxity hurts an inflamed Stomach, for when the passages are loosen'd the humours flow thither more easily, and in the beginning Repellents are to be used.

Hor-

¶ *Horslius* (L. 4. Obf. 34.) observed heat of Urine to be caused by it.

XV. I would have those that betake themselves to the Practice of Physick to observe, that the Physicians that undertake to practise Physick all over France (yea and the Dutch Netherlands) get abundance of Money by those Remedies that draw forth diverse humours by one Channel, which they use to the benefit of their Patients for the most part, and therefore their whole art almost consists therein. Wherefore I advise every one to endeavour earnestly to have in readines choice Medicins that are notably endued with this faculty.

XVI. *Coloquintida* purges strongly, especially the Brain; but its Operation is violent, and it is very offensive for its great bitterness: Both these faults are corrected by infusing it in Urine; for by that means it both loses its bitterness, becoming almost insipid, and also its violence is so much broken, that it may be safely given to a Drachm: and so it becomes an excellent remedy for all Diseases of the Head arising from a cold cause.

XVII. Elder, Dwarf-elder, and Flower-de-luce, are to be excluded out of the List of Purgers; for though they do not purge much, yet that which they do evacuate, they do it with very great violence.

XVIII. Always when Hellebore is given in a small quantity, we must add to it *Diagridium* or some other strong Medicin that may drive it forth of the Body, otherwise it will stay too long therein, and cause great disturbance and prejudice.

XIX. Black Hellebore is innocent: It is good for Quartan Agues, and for all stubborn Melancholick and Phlegmatick Diseases: A learned Physician gave half an Ounce of it for a Quartan, and cured his Patient thereby; having first given one and two Drachms in vain and without purging: It is given in Hydromel or Mead; or in a Decoction of Polypody, with the Seeds of Anise and Cummin, and Lykorrhize.

XX. *Fernelius* describes an Ointment, that being daubed on the Belly purges violently; but you can hardly make Tryal of it, or the like without Censure and loss of Reputation: For the Purgative Virtue insinuating it self into the Muscles and Membranes often causes a deadly flux of the Belly.

XXI. Whether are Purgers to be given in Substance, or in the Extract? Seeing there is but one part of purging Medicins, that purges, and every Particle thereof has not that Virtue in it, it is very advisable, by Chymistry to separate the profitable part from the unprofitable, the pure from the impure, and to extract the purgative part by some convenient Liquor; for that part that remains unextracted, will not purge at all, though you give three or four Ounces of it, excepting only *Coloquintida*. A Decoction works less than an Infusion; an Extract more; for in an Extract there is nothing but the resinous purging part, but in an Infusion there is still a good deal of the Liquor: This you may experiment by pouring cold Water into an Infusion, for the resinous Substance will be precipitated, and a Liquor of no efficacy will swim over it. ¶ Note, that in Extracts there is need of a segregative and a dissolutive. Lately there was given to a Woman in Child-bed a Drachm of the Rosin of Scammony without purging. ¶ In making of purging Potions we had need take heed, that we mix not such things as heat and dry much with a few Purgers, for whilst they purge but slightly, there will be danger through the Subtily of the remedy, lest the humours, being agitated and attenuated, be imbibed by the Noble parts, and sliding throughly into them obstruct the more obstinately.

XXII. Amongst Medicins purely Chymical, Luna or Silver is deservedly commended, being dissolved by the Spirit of Nitre, and then brought into Crystals: It is a powerful Hydragogue and an excellent Melanagogue. The Dose is to Four,

Five or Six Grains. It is best taken in the form of Pills, seeing it is very bitter. It is commended not only in the Dropfie, but also very much in all Melancholick Distempers.

XXIII. *Actius* greatly cries up the *Hiera* of *Rufus*, for he affirms that it evacuates naughty matters only, without touching the good; that it strengthens the Stomach, creates an Appetite, and dissolves Wind. But that I may deliver my Opinion, the use of the great *Hiera*'s seems unsafe to me; and I affirm this both from Experience and Reason: From Experience; for when I saw them given in Italy, by Physicians that were otherwise Learned, I never knew it done without prejudice and trepidation; for they bred very grievous Symptoms: From Reason; for there enters into their composition *Coloquintida* not duly prepared, and whose quality is not rendered mild enough by the addition of the aromata (or Spices:) Therefore I would rather advise to use *Trochisc. Albandal* in its stead.

XXIV. *Hydragogue* Medicins are almost infinite, and full of danger, for by a certain Natural filthiness they are adverse to the Liver, and Principal parts: And therefore they are never given to the benefit of the Patient, unless such things be mixed with them as may wash away that filthy injury, and add strength to the Noble Viscera: For the Liver generally languishes when it is moisten'd with an incursion of Water. Wherefore Reason persuadeth, and experience teacheth, that they are to be given with *Mesue's* Syrup of *Eupatorium*, or *Agrimony*, &c. Those that are more gentle, may be given to soft Men, and sometimes to Women with Child, but not rashly: The stronger are neither to be given to Children, nor to old Men, nor to Women with Child, for they provoke the Terms, and very often precipitate the fetus. Nor are they to be prescribed to the wasted or cholerick, nor to those sick of a Fever, or an acute Disease; nor are they good in very hot weather: For these should be set apart for strong Men, that have been long held with cold diseases, and that when the Weather is temperate and cool.

XXV. *Jalap* is to be accounted to be very like to *Scammony*, or is very resinous like it, so that those cautions which **Hofman* will have to be observed in the use of *Scammony*, are by no means to be neglected by young Practitioners. He says, 1. Let not *Scammoniate* Medicins be given to those whose Stomach (I comprehend the Intestins) is weak, such as are commonly the Hypochondriack. 2. Nor to the hot, and such as are prone to Fevers, for it very much disturbs their Bodies. 3. Nor in particular to those that are apt to swooning, perhaps by reason of the Mouth of the Stomach. 4. Nor let it be given in Substance in Broth. Yea, I remember, that it has often happen'd to some Individuals, that a Scruple of *Jalap* or but six or Seven Grains of its Rosin have caused a Superpurgation. At *Copenhagen*, there is to be sold in the Shops *Spec. Diagalape*, which other Practitioners commend to their Patients daily with good success; and yet that excellent Person N. used this Medicin unhappily, which had been approved of for so many years. So true is it, what *Hofman* very well observes †, That all Medicins do not presently betray their Malice: For *Cantharides* (for instance) do at length put forth their exulcerating faculty in the Kidneys. So though *Scammony* (I add *Jalap*) do not very much offend the Throat or Palat, yet it offends the Stomach, Liver, and other inner parts. Indeed it has some thin and fiery parts, some earthy adust (which I use to call Sulphureous and Saline:) and by these latter it absterges indeed, but by the former it very powerfully dissolveth, opens, attenuates and attracts. Thus *Sennertus** declares, that neither *Rhubarb*, nor the Leaves of *Senna*, nor *Scammony* or other Purgers are so apt to make the Hemorrhoids flow, in those that are disposed to them as *Aloes*, that is, the

Sylv. de 1.

Heurn.
meth. l. 2.
c. 26.

* 1. de Me-
dic.
Offic. c. 34.

† Obf. §. de
Medic.
Offic. c. 34.

* In para-
lip. ad in-
sit.

the malice of Aloes first betrays it self in the *Anus*, or freight Gut. So I have been taught by *Fabritius*, that the use of *Crocus metallicum* is to be avoided by old Men, and such as are subject to the falling out of the *Anus*, because it is injurious to the Sphincter thereof. Jalap therefore is not so gentle, as many persuade themselves. And I am more and more confirmed in the Opinion that Jalap and Scammony are of the same nature and temperature, which (*Scammony*) *Mesue* says indeed is hot and dry in the third degree, but *Tabernemont*, after *Dodonæus*, hath determin'd, it ought to be ranked with the moderately hot and dry: Therefore we must by no means subscribe to those that write that Jalap is hot and dry in the Fourth Degree. Yet I deny not, but that the resinous juice of Jalap newly prest out, and as yet not thickned by art, is far hotter and more acrimonious than the Roots of Jalap cut into slices and dried, which purge out serous humours by their whole substance, not as they are hot. Thus the expressed juice of our Country Flower-de-luce is very acrimonious, and burns the Throat as it were of hydropical Persons, which thing is not observed even in the *Florentine* Flower-de-luce dried. Hence *Hofman* * teaches that fresh Flower-de-luce is hot and dry in the Fourth Degree, but that being dried it stays at the First Degree, or however does not ascend above the Second; though others declare it to be hot and dry in the Third Degree. What is therefore taught of the hotness of Jalap, is to be understood of the fresh, and in its native Soil, and not of the dried.

* 1. De
Med. Offic.
c. 20.

XXVI. It ought not to be given when the humours are in motion, for then even a Grain or two will cause a superpurgation, as if one had taken too large a Dose: So a Merchant of *Lipsick* died of such a superpurgation, that had taken a Drachm of Jalap. But yet there is not always the same danger, for I myself have been very well purged by the same Dose in a turgency of the *Serum*, from a suddain impetus whereof my Face had swelled wonderfully, which fell again quite in an hours time: Yet it should rather be used for a *Stimulus*, and especially its rosin.

Amman.
Med. Crit.
p. 49.

XXVII. But if any should ask me, whether I thought Jalap or Scammony safer, I should say that Jalap were; because that Scammony which is fetched from *Antioch*, the famous Mart of *Syria*, and from *Asia*, and is brought to us, is for the most part (as *Dioscorides* testifieth, *L. 4. C. 17.*) adulterated with the Juice of *Tithymalus* or Wolfs Milk, or however is not gathered after one manner, whence 'tis no wonder that it evacuates Cholera and Phlegm sometimes most enormously, and sometimes very gently and without torment. On the contrary the solid, dried and resinous roots of Jalap are imported hither from *America*, of which (adulterated by no tricks) we artificially prepare a Magistery or Rosin. I use to infuse it for a Night upon hot Ashes from half to a whole Scruple in a Spoonful or two of Cinamon Water, and without straining to dilute it in a draught of Pilsen (or Cream of Barley) prepared without Milk.

S. Pauli
Quadrup.
Botan.
p. 473.

XXVIII. If any would prescribe the Rosin of Jalap in liquid purging mixtures, let him order it to be stamped a little with the Oil of sweet Almonds, for otherwise such mixtures will work little or nothing, and they will rather stick to the Stomach and Intestins by their clamminess, which will cause Gripping and Colick pains. Otherwise it is found by frequent experience, says *Rolfincius*, *Diff. 1. Cap. 2. Of Tartar*, that a Scruple of the best resinous Jalap has by loosening the Belly very happily cured Colick pains that even threatened a Jaundise, even without premising a Clyster, which also does not always do its Office when plentiful faeces possess the beginning of the Colon on the right side near the right Kidney.

Th. Barthol.
Cent.
5. Hb. 69.

Fr. Hofman.
m. m.
l. 1. c. 8.

XXIX. 'Tis most common to use the root of Jalap in the form of a decoction or infusion: But

seeing its Vertue is lodged in its rosin, and its appropriate *Menstruum* is neither Wine nor Water, but only Spirit of Wine, therefore it may be with Reason doubted, whether such decoctions and infusions receive the Vertue from these Roots. Some think that it will help, if the Jalap being bruised be first steeped in the Spirit of Wine, for so its Tincture being drawn is mixed with other Liquors with good success. Moreover the purgative Vertue, that is lodged chiefly in the Rosin, is communicated to Wine and Beer after digestion: Experience witnesseth that these Liquors purge; therefore we need not proceed so strictly, but may use it sometimes in decoctions and infusions, when there is an indication for purging a Phlegmatick and Serous humour.

Rolfinc.
meth. gen.
p. 507.

XXX. Some put *Lapis Lazuli* in the List of Poisons. The Greeks attribute to it a Vertue to gnaw moderately, to deterge crusts and to exulcerate: Whom *Mesue* following says it has a Vertue to burn, ulcerate and putrefie. *Fuchsius* (in *parad.*) thinks that none of the ancient Greeks gave it for purging black Cholera, as not being to be taken without great hurt. But verily it ought not to be numbred simply among Poisons, but only amongst the stronger Purgers that want not all Malignity, and it has been successfully used by the *Arabians* and *Moderns* in the cure of Diseases arising from black Cholera. Yea *Mesue* attributed to it moreover a Vertue to comfort, exhilarate and preserve youth; upon which account the *Arabians* have receiv'd it into conf. *Alkermes*.

Holler. de
morb. int.
c. 41.

XXXI. *Manna*, because of its plenty of *Flatus*, and because it is apt to turn into Cholera, cannot be given safely to the Choleric, and to those whose Inwards are much burned.

XXXII. Now I would give it in the evening, for it works better then, as the manner is at *Rome*, where they give it at Night to chuse, and they find that it operates more happily, but presently before Meal: It is given from an Ounce and an half, to two Ounces.

Montan.
consult. 43.

XXXIII. Though *Manna* evacuate thin humours, yet we must not abstain from it when the humours are prepared, that are in the *Mesaraick* Veins, especially in a Catarrh joined with a fever. I have often seen that *Manna*, though it evacuate thin humours, does open obstructions, and a preparation being made, I have seen a crisis effected.

XXXIV. Let not *Manna* be given crude, but boiled, because it abounds with *Flatus*; and with acrimonious things, as Thyme and Hyssop, that its action may be the quicker. ¶ Let it not be given alone in hot Diseases, Natures or Seasons, but either with Whey, or some cooling Liquor. ¶ If thick humours be to be evacuated, let the Cream of Tartar, or Oxymel simple be added. ¶ Be not over long in eating after it, for otherwise it is rendred ineffectual, because it turns to nourishment.

Hofman.

Claudius.

Capivac.
Montan.

XXXV. *Mechoacan* is a Divine Medicin in spurious, compound, erratick Fevers: it purges bilious humours both thin and thick, and also thin and thick Phlegm; it expells putrid humours, resolves and dissolveth *Flatus*; cleanseth the Liver, by opening Obstructions, and greatly strengthening. It cures Obstructions, and all Diseases arising therefrom: It is good for Diseases of the Kidneys from thick humours; of the Womb from thick *Flatus*; for all difficulty of Breathing; for pains of the Guts and Stomach, greatly strengthening and heating the Stomach: It cleanseth the Brain and Nerves; is excellent for the Gout, and other pains of the Joints. Lastly, All those Vertues are found in it, that are found in *Agarick* and *Rhubarb* mixt together, before which it is to be preferred. But 'tis requisite this Root be fresh, not woody or rotten, lest it perform not what is expected. ¶ It is given in Beer, or is mixed with Conserves, or also

ver. cen. 1.
c. 13.

also solutive Electuaries: Pills are likewise made of it: It exerts little or nothing of its Vertue in Infusion: And we must take heed, that we drink no Wine at Dinner, for that not only slackens and dulls its Faculties, but also wholly hinders and destroys them. Therefore when it makes one faint by purging too much, give a draught of Wine or a Toast steeped in Wine.

Abr. Seiler
in Epist.
Scheltz. 9.

XXXVI. *Mercurius dulcis*, or the *Panchymag*, of *Quercetani*, being fortified with *Mercurius Vita*, is as Two Grains of this latter be added to Seventeen of the former, is a very good Cathartick. But note that this mixture is to be ground diligently on a Marble for some hours, for by that means the Vomitive Vertue of the *Merc. Vita* is dulled, and with the *Merc. dulcis* it purges only gently by Stool.

Hartman.
prax. l. 1.
cap. 4. §. 1.

XXXVII. A Child of two years old, having contracted the Pox from its Nurse, was cured by *Merc. dulcis* taken to Eight Grains, when a Decoction of *Guaiacum* had been used to no purpose: With these Eight Grains, there were mixed four of *Diagridium*, and he took it every Fourth Day. ¶ *Formius* reports that another Child who was born pox'd, when it was fifteen days old, took two or three Grains of *Merc. dulc.* in Sugar and Milk, continuing it for a Month, by which it was cured. ¶ Yet I will not pass by in silence, that by its use the straight Gut sometimes falls down in old Men; for whom, seeing they abound in Phlegmatick humours, perhaps any Mercurials are not so convenient and safe. ¶ If Mercury be given for a Purger, it causes stools that are betwixt a Skie colour and a Green.

XXXVIII. Of Chymical Medicines that purge Phlegm, I commend all those prepared of Mercury both by Sublimation and Precipitation, some whereof use to be given in a larger, others in a smaller Dose. For of the Sublimates that which is called *Corrosive* is seldom given to one Grain, but the *Dulcis* may be given even to Thirty: And the Precipitates, the more they are fixed with an acid Spirit, &c. in a long and strong Fire, in the greater quantity may they be taken; but the less fixed, in the less. *Mercury Sublimatus*, that is called *Corrosive*, differs from the *Dulcis* (or sweet) in this, that being very acrimonious and corroding, there is new crude Mercury added to it, with which it is ground, and Sublimed again; in which new Sublimation, by the fresh Mercury that is added to it the acid Spirit that was in the former, is infringed, and that so, as that all its acrimony seems to be obliterated, and it is therefore called *dulcis*. Whence it is clear that all that great gnawing Vertue and Acrimony of the corrosive Mercury depends not on the Mercury it self, but on the acid Spirit that is plentifully concentrated in it, and is driven upwards and sublimed with it: For there is not only more Mercury in the sweet than in the corrosive; but moreover, not only two or three times, but even thirty times more of the former than the latter, and yet the latter is more safely used. Whence also it appears, that the noxious quality of corrosive sublimates is not to be ascribed to the Mercury it self, but to the acid Spirit that is concentrated in it in great plenty, and continues in its acrimony; seeing when it is made sweet by the addition of new Mercury and subliming it again, it then becomes at least thirty times a more gentle Medicine. How to

Sylv. de le
Boc appen-
dic. tract.
vi. §. 210.

dulcify Mercury without the addition of fresh Mercury, See Sylvius as quoted in the *Margent*, §. 215. It is strange that by a new addition of Mercury and Sublimation, so great and hurtful, so austere, burning and gnawing an Acrimony as is in the Corrosive Sublimates should be covered and hid, yea corrected: For I think there can hardly be found in Nature any austerity that can be compared with that of this. And whereas austere or sour things are generally earthy and of an obtuse taste, this Mer-

cury is withal most acrimonious, and consuming almost all things; which therefore I had rather Physicians would abstain from, than use frequently, if they would be very careful of the health of their Patients.

Idem meth.
med. lib. 2.
cap. 5. §.
26.

XXXIX. Note that *Merc. dulcis* sublimated given to Sixteen Grains, purges more in a Body that is full of bad humours, than Thirty will do in another that is not so full. In the giving of Mercury howsoever prepared we must note, 1. That Pills are the most convenient form of giving it; namely, lest the Mercury by too long stay in the Mouth should offend the Palat, causing a Flux, and making the Tonils swell, the thinner humours being drawn from every where to the Palat by a certain proper familiarity of Nature. 2. When you go about to incorporate Mercury, think it always advisable to add a drop or two of the Oil of Sulphur, for this does bridle its malignity, and fastens its volatility that tends upwards; and corrects the Symptoms that it causeth. 3. Note, that after having taken Mercury, some Gruel or Broth is to be taken within two hours at the most, and some Meat within half an hour after that, that it may not stay too long in the Stomach. 4. Let it not be given often or much to the Bilious, because by purging forth the Serous humour, which is the Bridle of Choler, it may do them harm. 5. Let it be given with Turpentine, or the following Extract of *Coloquintida*. Take of *Coloquintida* that has been kept for some years, (without its inner Husks and Kernels) half a Pound, of pure Scammony four Ounces: Slice them, and draw a tincture from them with unrectified Spirit of Wine: Throwing away the feces put the tinctured Menstruum in a Cucurbit, and in Balneo Mariæ, let the Spirit of Wine be extracted to the consistence of Honey or Pills. ¶ *Merc. dulcis* is 1. Not to be given but in Pills, or in a Bolus, never in powder, because it is an Enemy to the Teeth and Gums. 2. Let it be given well prepared, I mean not, over often rectified, but yet choice and well washed. 3. It is given in impurities of the Blood, Scab, Pox, Itch and other Ulcers; 4. In serous Distempers, as the Dropsie, for all Mercurials make the Serum very fluxile, and hinder its coagulation above all other things, and melt the Phlegm, whence also *Pilule Quercetani* deserve Praise; 5. In fluxes of the Seed, or in a simple and virulent *Gonorrhoea*, for the same Reason amongst other things, for it breaks and cleanseth the Ulcer in the Seminal Bladders by which the malady is fed, whence also by its use the flux thereof seems to be increased. 6. It is good against Worms of all sorts.

XL. *Mercurius dulcis* is esteemed by some as a Panacea or Universal remedy, but it is the most profitably used in the French Pox: Its Dose is from Fifteen Grains to Thirty. It is good to acute it with a little of Scammony prepared, *troch. Albandal* or some other purger, that it may not stay long in the Stomach or Body, and raise a Salivation and other dangerous Symptoms that use to attend Mercury, as I have known it sometimes do. And we may affirm of all Mercurial Medicines in General, that it is convenient they should be exterminated out of the Body as soon as they have performed their Operation: For experience has taught, that when they are retained, they return to their pristine Nature, and have been the Authors of the worst Symptoms.

Sennert. E.
turn to their
pristin Nature,
and have been the
pist. 28.
cent. 1.

XLI. Very many commend *Mercurius Vita* wonderfully for evacuating all vitious humours in the Stomach, and all parts of the Body upwards and downwards; and therefore they use it not only for the French Pox, but also for the Gout, Dropsie, Agues; Melancholy Madness, and very many other Diseases: Yet it is to be used warily, as are also other Mercurial Medicines, and not save when the Body abounds with many thick humours. But let it not be given in lean, cholerick, and weak

Bodies.

Sennert. Bodies. The Dose is from One Grain, to Four or
Cent. 1. Five. ¶ That this Pouder contains no Mercury in
Ep. 33. it is clear from hence, because this being deprived of
its Congelative Salts, resumes the former species
of Quick-silver, and is all of it collected in the
Retort: This Pouder being too fiercely Vomitive,
if it be ground with Sea-salt calcin'd and sweetned
with often washing, becomes far milder, and safe
enough.

Willis's
Phar. p. m.
66.

XLII. Mountebanks give *Mercury Precipitate* without choice, for the long continued pains of the Pox, the Dropie, Quartan, Hypochondriack Melancholy, and for cold Diseases of that kind, and that to four or six Grains, in the Yolk of an Egg, or Mithridate and Treacle: And as soon as any one has taken it, all sorts of humours from the whole circuit of the Body burst forth upwards and downwards, often with so great violence, especially if the Body be weak, that the Patients Spirits being exhausted and his faculties enfeebled, he either dies suddenly, or on the Day he takes it, being without strength, without Pulse, without Voice he lies like one dead. His Mouth is sometimes inflam'd by the contagion; and his Gums contract putrid and very stinking Ulcers, and in the most the throat becomes so swell'd, that for many days they can swallow nothing at all: Yea, and in some the Mind is so alienated, that a Fever arising, they die at length frantick. Therefore let it be rejected out of the List of Catharticks as a most ready Poison, and be banished by publick Laws.

Palmar.
de morb.
contag.

XLIII. *Myrobalans* should never be mixed with any strong Medicin, because those violent things staying longer in the Body through the binding Vertue of the *Myrobalans*, do sometimes bring great harm upon the Body: Wherefore those Medicins ought rather to be mixed with others that purge hastily.

Rondelet.
Cap. 36.
l. 1.

XLIV. Some, that think themselves very wise, order *Myrobalans* to be rubbed with Oil of sweet Almonds, whether they be to be reduced to Pouder, or broken grossly for Decoctions. But indeed they do ill that chafe those *Myrobalans* with Oil that are designed for decoction, for the Oil hinders at least the Water that is poured upon the *Myrobalans* from insinuating it self into them, and passing through their substance.

Hoefer.
Herc. Med.
l. 1. c. 5.

XLVI. *Gummi Gotte* is a powerful Hydragogue, less violent than the root of *Efula* (or Spurge) *Mesereum* and *Elaterium*; it vomits also. The Dose is from two Grains, to four or six, though some imprudently give it to half a scruple. The best preparation of it is to dissolve it in rectified Spirit of Wine, and then by pouring common or Rose Water upon it, it will be precipitated to the bottom: The Pouder being of a very fine Yellow is called its Magistery; and it becomes a far more excellent Medicin than when taken crude.

Sylv. de le
Boc. m. m.
l. 2. c. 9.

XLVII. The chief use of the Salt of Tartar is in a *loosning Pilsan*, which is made of two Drachms of *Senna* infused in eight Ounces of cold Water with a Scruple or half a Scruple of the Salt of Tartar, by which the Tincture of the *Senna* is powerfully extracted; so that this Pilsan purges far more powerfully than the common.

River.
pract. l. 1.
c. 4.

XLVIII. *A. Spigelius* relates that the use of the Pouder which *Marcus Cornacchimus* has recommended in a particular Book, was prohibited at Rome

under pain of being condemned to the Gallies, because a certain Physician had formerly kill'd several with it: But because by his own experiments, especially in Tertian Agues, he had found it not only an innocent, but also a very wholesome Medicin, he thought that hardly any other cause could be imagin'd, than that that Person had not prepared his *stibium* according to Art: Namely, whilst he would make it a Diaphoretick by the Addition of Nitre, without doubt he unskillfully reduced it into a glass, whence proceeded those gripings and subversions of the Stomach, with swoonings springing from Convulsion and other lethiferous accidents: But the unhappiness of the Mistakers ought to have derogated nothing from the excellency of the Medicin. ¶ Many preparations have been invented, even in Purgers, particularly in Scammony and Jalap, the best amongst which is the Magistery made with six, eight or ten pounds of the Spirit of Wine poured upon one Pound of Scammony or Jalap, without the Addition of the Spirit of Vitriol or Salt of Tartar, which rather hinder than further the extraction of the Rosin. Indeed these very Magisteries are almost the same with Extracts, save that seeing they are more globous and plentiful, besides the extraction which is of the same Nature with Solution, by pouring even simple Water upon them, they are precipitated to the bottom, if so be the Spirit of Wine be very well rectified, for when the same is sufficiently drawn off they subside even of themselves: So that they are the more depurate part of the Purgative, or Alterative it self, and so choicer and purer than the rest. Hence we may learn what to think of sulphurated Scammony: for though 'tis to be confest that the Medicin, for whose sake it was formerly so prepared, viz. the three-headed *Cerberus* (of Scammony Sulphurated; *Antimonium Diaphoreticum*, and Cream of Tartar, mixed in a different quantity at pleasure) is excellent in Fevers and other Diseases, and that we have always experienced the use hereof to be safe; yet the sulphurated Scammony is it self far better omitted, and very profitably exchanged for its Rosin. Whereof these are the reasons; 1. Because that which is sought for, is maimed; 2. That which is not desired, is retained. The purgative Vertue is maimed, which consists in a Sulphureous Salt: Whence *Helmont* says truly, That as much of acidity as the Scammony receives, so much does it lose of its Vertue; for every acid is in it self contrary to purging (though by accident, some, especially the very sensible, are loosen'd even by acids through the acrimony that is joined with them) wherefore here can be said to be no correction, especially seeing the *fordes* or dregs, which was the argument, by this means remain, and are not separated. For he that has prepared the Rosin of Scammony, has doubtless observed gravel and terrene Bodies, which are not only unprofitable, but rather hurtful to Man's Body: Whence we have sometimes observed that terrible gripings have been caused by the giving of this Medicin (*pulvis Cornacchimus*) for how can the Body subdue and bear such Heterogeneous things?

Velfchius
Obs. 98.

G. W. We-
del. Pharm.
p. 168.

XLIX. *Rhubarb* is not found so hot with us, as the *Italians* give it out to be; perhaps the difference of the climate is the Reason. ¶ The true and intire *Rhubarb* induces violent pounding; but that which is spongy and rare, not so: For this latter being very much pounded or ground, loses its purging faculty through the vehement heat that it contracts by the agitation. Being strongly ground it becomes more powerful to bind and incrassate, for by the strong motion the fiery purgative quality exhales, and the styptick and earthy remains, which is effectual to strengthen. ¶ It needs a little correction with Cinamon, where there are obstructions, that it may the more easily

Valerius, m.
p. 46.

Pharma-
cop. c. 1. de
purgans.
easily

easily be dispersed into the Veins: Laven-
der Flowers are commonly added; but in those
that are apt to Vomit, or in Women with Child,
or in a febrile heat, we must abstain therefrom.
In a squalid Disease, cold and moist things must
presently be subjoined to the use of Rhubarb.

Heurn.
meth. l. 2.
c. 22.

L. *Rhubarb* purges, strengthens, and opens obstruc-
tions more in substance, than does its dilution;
and its astringent Virtue helps purgation by com-
pression: Besides, it retains the purging Virtue
longer in the Bowels, whence there is a larger ex-
purgation: Wherefore when a small Purgation is
desired, as in Children, and in such as are easily
dissipated, and weak Bodies, use the dilution (or
infusion) of it: If a stronger, use it in substance,
which will evacuate not only Choler, but Phlegm
also. Now you will find no Remedy better for
obstructions of the Liver than the substance here-
of, made up into Pills, Troches, or taken in Pou-
der, or also chewed and so swallow'd. You may
eat thus a Drachm or four Scruples with Raisins
an hour before Dinner, whereby not only is the
lax substance of the Stomach strengthen'd, but its
sides also deterg'd, and whatsoever excrement is
in it and the mesentery, gently purged out, and the
Liver freed from obstructions.

Augen. in
Epist.

LI. The purgative Virtue of *Rhubarb* is not taken
away by toasting of it; for it is more fixt than to
vanish into the Air by a slight drying of it by the
fire: If we desire its astringent Virtue, 'tis bet-
ter, after we have thrown away the first deco-
ction, to boil it again, and so to draw forth that
Virtue by a strong squeezing.

Schroder.
in Phar-
mac.

LII. How fumous *Rhubarb* is, so that it easily
affects the Head, yea induces a *Vertigo*, is clear from
this Instance: I knew a Person who by the daily
use of crude *Rhubarb*, whereof he was advis'd to
eat and swallow fasting about a Drachm without
more ado, to keep his Belly loose, that after a
while complain'd of a *Vertigo*, and that incurable,
the only and chief cause of which Malady, the
other animal Faculties being intire, I guess to be the
continual use of *Rhubarb* for some years, because, as
I said, *Rhubarb* is very fumous, which is to be af-
cribed wholly to its very Volatil Salt and Sulphur.

S. Pauli
Quadr.
Botan.
p. 455.

LIII. That is not to be pass'd by, which *Astu-
arius* hath recommended to Memory, yea, it ought
to be taken notice of by all Physicians, viz. that
Scammoniats are not to be mixed with Pottage and
Broths, for, says he, it is found by experience that
Scammony cannot be reconciled to these: Where-
fore let Physicians now a days observe, that *Scam-
moniate* Pills are not to be dissolved in Broth, and
so given to drink, seeing many have died there-
upon, as I have seen at *Venice*, and at *Ferraria* in
Sam. Abarbanel, who died upon drinking of Pills
so.

Amat. Lu-
sit. Comm.
ad Cap.
171. l. 4.

Dioscor.

LIV. *Scammony* is the soul of purgers, and the
best of all purgers, if so be it be used with Judg-
ment, because it is violent, and yet neither too hot
nor too dry. ¶ *Scammony* is best corrected by the
Electuary of the Juice of *Roses*, which I use for the
most part when there falls out a necessity of *Scam-
mony*. Let it never be given in Broth, for that
is pernicious. ¶ Those who being struck with a
vain and preposterous fear, are afraid of *Scammony*
(and *Scammoniats*) which is a very gentle and safe,
though powerful Medicin, and therefore dare not
give it to their Patients, let them use *Rhubarb*.
Scammony is prepared readily and very well, if in
a convenient Dose, (viz. Twelve or Fifteen Grains,
accordingly as one is easier or harder to purge)
it be pounded in a Mortar and a little of some
convenient Water (as of Balm, &c.) be poured
to it, and the milky Liquor that is drawn from it
by pounding, be poured off gently, and the re-
maining Virtue be likewise drawn out by pou-
ring on new Water, the black feces remaining in
the bottom: Then to the aforesaid liquor add two

Valzus.

Heurnius.

Drachms of Cinamon or Fennel Water, and like-
wise two or three Drachms of the Syrup of *Roses* so-
lutive; and so there will be made a very grateful
draught. Which that it may work the better, it will
be good about half an Hour after taking the draught
to give the Patient a Scruple or half a Drachm
of the Cream of Tartar in Broth. Very grateful
Tablets or Lozenges may also be made and pre-
served for use: Take of the Crystals of Tartar an
Ounce and an half, of *Diagridium* three Drachms, of
the Oil of Cinamon six drops, of White Sugar dissolv'd
in Rose-water Eight Ounces, mix them. These may
very conveniently be given to Children from half a
Drachm to a Drachm, to Youths to two Drachms.
¶ See the Correction of *Scammony* in *Potterius Pharm. Pract. l. 1.*
L. 1. Sect. 5. who gives it to a Scruple. *Scammony* is c. 2.
corrected divers ways, 1. In a Quince, and so it is
called *Diagridium*; but this preparation cannot be
called a true and exquisite correction of *Scammony*,
seeing the Pulp of the Quince that is added,
does only strengthen the Stomach, but not direct-
ly weaken the force and violence of the *Scammony*:
And therefore its genuin preparation is this;
2. Being finely powdered spread it thin and equally
upon brown Paper prickt full of holes, with Pins,
and let the Paper be held over the smoak of pou-
dered Sulphur: Not so as that the *Scammony* may
begin to melt, for then the smoak of the Sulphur
could not penetrate it; but rather that the *Scam-
mony* may be smoaked thereby by a slow Fire
without liquefaction: The longer this is a doing,
the better will you prepare and correct it.

Zwelf. in
Animadu.
Pharm.
Aug. p. m.
165.

LV. *Senna* is a kindly Medicin, if it be given
either in substance or infusion; but not so, if boi-
led, for then it uses to gripe. Because of these
gripings Aniseeds and other carminative Seeds use
to be added to it, yea, and the stalks to be thrown
away, seeing Wind and griping are supposed to be
chiefly caus'd by them. As far as I have been
able to observe, when a decoction is made of *Sen-
na*, its intimate Virtue seems to be drawn forth,
which evacuates not only Phlegm whether more
or less glutinous; but also sour and acid, and so
the most Melancholick humours, to which those
gripings are owing: Whence to such as abound
with sour and acid humours, *Senna* is not so pru-
dently given, unless those humours be partly at
least prepared and temper'd. And hence it is that
in some, *Senna* always causes gripings, because they
abound with sour and acid humours, which thing
happens not in others in whom Phlegmatick hu-
mours only abound, especially when the same are
less glutinous. ¶ The famous *de Mayerne* prescribed
Lavender-flowers for correction: But it is found by
experience, that the gripings are more certainly
prevented by the addition of crude Tartar, its
Cream, Crystals or its salt it self. Now gripings
and *Flatus* are owing to the nature of the humours
that are drawn forth by the *Senna*, which are thick,
tough and clammy, and have not a free passage;
yea, whilst they part from the part which they
clav'd to, they hale and pull it as I may say; yea, by
the very Carminatives that are added, new *flatus*
are rais'd which cause pain. Further we must note,
that that is true which *Schroder* says in his *Pharma-
copœia*, That *Senna* gripes because of the more crude
and earthy parts squeezed out by a strong straining
of it. A Citizen of *Neuenburg* once complain'd to
me, that a purging Potion I had prescrib'd him did
not gripe him, though he had plentiful stools,
thinking it therefore to be dull and too weak:
The next time I had occasion to purge him, re-
membering his Accusation, I prescrib'd a griping
decoction of *Senna*, upon which he sent for me to
ease his gripes: Which being over, I told him that
it was the art of a Physician to prevent such gripes,
not to raise them, which afterwards he acknow-
ledg'd from his own experience to be in his power.
Platerus* says that *Senna*, *Agarick*, and *Turkish* being

Sylv. de le
Boë m. m.
l. 2. c. 7.

* Tom. 2.
Prax.
p. 506.

in-

infused in Wine lose their griping quality: *Trincavella* says that *Senna* offends the Stomach, and therefore he corrects it with Raisins that are friendly to the Stomach, and with *Lykyrrhize* to assuage its driness. *Claudius* thinks that *Senna* when it is infused in Odoriferous Wine, needs no other Corrective.

LVI. The dose of *Senna* is from one Drachm to two; and of the Powder of *Senna* and the pulp of Prunes there is made a not ungrateful and sufficiently safe Electuary, the dose whereof may be greater or less accordingly as more or less *Senna* is added. But I cannot assent to those that think that a Scruple of it is enough to impregnate thirteen, yea twenty ounces of a convenient Liquor (as suppose some decoction) with a purgative quality; for experience shews the error of those men though never so obstinate. But on the other hand those do as imprudently, who infuse a great deal of *Senna* and *Rhubarb* in a small quantity of any Liquor, whereby often, I will not say all their virtue, but not half, nor a fourth part of it can be drawn forth. Thus fools while they shun one extremity, run into another.

LVII. I am not of their opinion who think that *Senna* disturbs and weakens the Stomach: for seeing it is dry, and has something of bitterness and astringency in it, it is manifest that it profits the Stomach. And the reason why the bodies of Women and the Phlegmatick (chiefly) are griped by an infusion of *Senna*, is to be imputed to the fault of the Phlegmatick humours, and not to the Medicin, and sometimes also it happens through the narrowness of the ways: wherefore such bodies are to be prepared. ¶ The reason why it raises griping, some will have to be from the abundance of glassy Phlegm or of an acrimonious mucilage: but those seem to think more truly, that ascribe it to the more crude and earthy particles of the *Senna* drawn forth by strong straining. ¶ Hence we observe that its extract has no such effect.

LVIII. In making the Infusion of *Roses*, we must note that it is never to be made an end of in May, and by consequence neither are the Syrup of *Roses* solutive nor the Honey thereof to be made of a new and fresh infusion, because it first stays a little, and afterwards ferments like new Wine: from whence we must observe that Physicians are by no means to use it to make either the Syrup or Honey, till the ebullition be quite ceased, which it uses to be in June; for otherwise it will be very apt to gripe, or sometimes it will so irritate Nature as to cause very plentiful and dangerous dejections, &c.

LIX. Syrup of the juice of *Roses* made by three Infusions at least and a strong expression, is good to lessen any Cacoehymy, but especially the Cholerick. *L. Septalius* * thinks that the Syrup of *Roses* solutive ought not to be reckoned amongst Lenitives, especially in Cholerick Natures and Fevers: For he has observed it, taken either alone or with Whey, to evacuate so great plenty of humours, as the Stomach and Guts could hardly receive, whence he always thought that it moved other regions of the Body besides the first: Many things happen unlookt for: It seems not to me to have done that of itself: It is sometimes adulterated by Apothecaries, (that will not take the pains to repeat the infusion oft enough) with *Diagridium*. *Rosincius* (in gen. 3. part. p. m. 462.) says in defence of *Septalius*, that the Syrup of *Roses* is an Hydragogue Medicin, which is clear by experience, especially if given alone: Now such is the Nature of Hydragogues (or Purgers of Serum) that by unlocking the mouths of the Vessels there sometimes ensues an immoderate purgation, namely from the Nature of the fluid humour, that having obtained a passage glides forth of its own accord. Whence a superpurgation has sometimes happen'd

upon the bare giving of Manna. See *Fortis* cent. 4. consil. ult. 1. tom.

LX. Some infuse an Hundred and twenty pound of *Roses* in Thirty two pound of Water, and adding Twelve pound of Sugar boil it into a Syrup: Which is a making great waste of the *Roses*, for a far less quantity will serve to make it Purgative. And if any being not so desirous of the Purgative virtue of the *Roses*, do rather by repeating so many infusions as are requisite to spend so large a quantity of *Roses*, endeavour to increase the cooling virtue, such an one certainly is much mistaken; for the oftner the *Roses* are infused, so much the bitterer will the infusion be, and bitterness is not the offspring of cold, but of heat, therefore this infusion will not cool so much. Not to mention, that it has been observed more than once, that by giving this Syrup that has been prepared of so frequent infusions, Febrile heats have not only not been diminished and allayed, but even increased, and a double Tertian made of a simple one. This happens chiefly from a large exclusion of the Serum (for this Syrup is an Hydragogue) which is a bridle to the Choler.

LXI. *Mesue* (cap. xi. simpl.) notes that *Violets* cannot endure much boiling, as if he had said that they are of thin and volatil parts. For this is to be observed, that the more fragrant any flowers or fruits are, by so much the apter generally is their fragrancy to vanish, because of the great volatility of their Sulphurs and Salts. Nor is there any reason but this, why the Syrup of *Violets* made by many infusions, being given from one Ounce to three, does more irritate the Belly, than the juice given from two Ounces to five, and is far more fragrant than that made of the juice; than which Syrup no Medicin can be devised more convenient for the Pleuritical.

LXII. I will admonish all Practitioners in Physick, that they do not, like the Vulgar, too highly commend *Worm-wood-Wine* indifferently to all persons, but only to those who labour, not of a bare intemperies of the bowels alone, but in whom these are full of slimy and cold humours. Therefore let us cease to wonder how it comes to pass that the greatest part of great drinkers, who guzzle freely every day either *Wormwood* or *Burnt-wine*, die before their time Consumptive, melting away as it were by degrees. Wherefore let *Wormwood-Wine* only gently move the belly, prepared with or without *Aloes* and *Centaury* and other Abstergers: yet you will not upon tryal find these and the like infusions made of such things to be so very safe, especially for Old men and in a dry constitution of body. Take these elegant reasons of *Hofman*, and *Galen* himself. We must be much more careful of Cautions (having spoken before of the corrections of *Aloes*, lib. 1. de med. offic. c. 3.) The greatest of these is (the same that is delivered by *Galen*. 7. m. m. XI. x. 707. 2.) Let it not be given to those who labour under a bare intemperature without matter; such need not evacuation, much less so strongly drying a Medicine, and which instead of evacuation causes a tabes: on the contrary it is given with great benefit to the cold and moist. The Second is from the same fountain, 1. de sanit. tuend. c. 11. Give it not to Old men, nor to such as are dried from any cause, unless in case of necessity: Which necessity, says *Heli-dius*, is, when humours abound. To which I object, That Old men are all of them excrementous? Therefore it is better to use others, especially such as moisten; concerning which consult *Galen* himself. The Third is from 3. aph. 15. Let not the use thereof be too frequent, nor so daily as some make it: for those are Golden words of *Galen*: The evacuation of superfluities, says he, that is made by purgers, is profitable to those that need it much, and have done so for some time; but the evacuation of those superfluities that are generated every day, deserves not so effectual a remedy.

remedy. And if any will use that evacuation twice a Month, for fear there should be heaped up a multitude of excrements; besides that it will do harm, it will also bring the Body to an ill custom. Let those hear this that use long decoctions or purging Infusions for months together: For supposing that the Body is thoroughly Purged thereby, yet the Viscera are miserably tormented. And such as value and have a care of health, will take these things as spoken to themselves: for it often happens that the unwarly destroy the causes of Life for Life's sake, that is, by the unseasonable and preposterous use of Purging and drying Medicines, do imperceptibly hasten on Old Age: For unless we grew dry, we might promise our selves a long Life. It is therefore a true saying: It is often the best remedy to use no remedies, Nature her self being the best Physician. And indeed those are the most diseased, that are ever and anon depending on the Box and Coffer of the Apothecaries. Who ever saw a Water-man, unless he were a fool, stuffing his Boat with Pitch and Tow, when it gaped not? Yet we industriously continue to corrupt our Body whilst we are in perfect health, with many Medicines, divers Pills, &c. Whereas we should not follow this custom, but for the aforesaid weighty reasons follow the course of skilful Surgeons, who know that in the curing of wounds endeavour is to be used that they be not cleansed too much, if we would heal and skin them: for if any do otherwise, together with the purulent filth he deterges the thick, clammy, glutinous Blood of the wounds, which is nearest the being converted into Flesh, and so the closing up of the wound is unwarily hindered. Those therefore who by swallowing Pills, especially those of Aloes, do every or every other day excite the small Guts above to excretion; or dilute the thick Guts below by Clysters; these verily through their unskilfulness in Anatomy, do by many harms kill many. For seeing the most perfect concoction of the natural bowels either cannot be finished without a previous and decent fermentation, (and fermentation is πνευματικός or windy, or the Chyle by means of it is said to grow spirituous;) or seeing the things to be concocted in the Stomach and Guts by secretion, are resolved also either into Spirit or Flatus, yea and skilful nature hath for this purpose annexed to the other Guts an empty sack as it were, called the blind Gut, that it might be a natural receptacle of Flatus, as the Gall bladder is of the Gall; I say seeing things are thus, a Clyster is not presently required, as soon as the Belly rumbles (which it often does without any trouble) or we perceive our Guts to be moved gently with a motion that is most natural to them, but hitherto taken for preternatural Flatus, &c. lest (to speak with Celsus) we consume in our health the remedies of sickness. It is known also, that Doctors of Anatomy teach us, that besides the proper (whether coats or) membranes, the Guts are naturally lined also with a crusty, fungous and mucous substance that the excrements may the more readily be driven down out of the Body being furthered by the slipperiness hereof: Which how profitable it is, we then come to understand, when after a long looseness, wherein this Phlegm has been expelled also, we come to want the benefit of excretion: Do not those therefore offer violence to Nature, that are daily scraping this crust from off the Guts with Pills and Clysters?

LXIII. 'Tis strange how apt Wine is to penetrate by reason of its volatil Salts, how entirely it often conveys the virtues of vegetables into the menstruum or Liquor. Hence I remember that D. Job. Michael did gravely advise, as often as Refinous Bodies were added to any Purging potion, that they were better extracted if a little Wine were added. On the same account 'tis better to use Mechoacan

in Infusion than in Powder: and Schröder (J. A. I. D. Major pharmac. § 448.) declares that the purging Spirit or *tract de* Infusion of Scammony, prepared with the Spirit of Malaga-Wine, purges without any trouble or disturbance.

LXIV. Simple Extracts are often better than compound, especially when the compound aim not all at one and the same scope. Thus the most simple Laudanum made of Opium alone, is in my opinion to be preferred far before all the Laudanums that are to be had up and down made with the essence of Spec. Diambra, &c. for these very things are far better added for the present use, according to the intention of the thing and the variation of circumstances. There is the like reason in the extraction of a mass for Pills, whence amongst other things it chiefly comes to pass, that Pills made of such a compound Mass have commonly so deceitful an effect. The same holds of most other common compositions, in which the *respects* as to the decent manner of mixture is seldom observed. 'Tis better to prepare the things which are to be prepared, and then to compound them at pleasure, or rather according to necessity, lest being overwhelmed as it were with a hodge-podge of Ingredients, we become either doubtful or deceived.

LXV. Purging extracts are a more sluggish kind of Medicine: The Resin of Scammony or Jalap may indeed be dissolved with the Spirit of Wine, and reduced into an Essence, which is a Medicine convenient enough, but yet a little too hot: But amongst Purgers Extracts are of more common use than Essences. Now that Purging Extracts are more sluggish in Operation, is clear by experience: For though half a Scruple of the Resin of Jalap, be equal in proportion to two Scruples of Jalap in substance, yet it Purges no more than one Scruple of Jalap. Yea Pills made of the Resin of Scammony or Jalap alone, have either no effect at all, or else an unfaithful one; that is, they either purge not at all, or more strongly than they should. If any ask how this comes to pass, that there should not be a stronger effect, seeing Resins and Extracts are, and are called the quintessence as it were, or at least the best part? The true reason hereof consists in the manner of resolution. Scammony, Jalap, and Rhubarb purge strongly in substance, in regard the Sulphur is more dispersed, and therefore they are more easily dissolved, and consequently stimulate the Guts to Excretion: And this very resolution of the Medicine is chiefly performed by the Serum, which as it is the vehicle of Aliments, so also of Medicines. But when the Resinous Sulphureous particles are more united, they are more conglobated and more hardly dissolved; yet when they are resolved, which they are in Bodies abounding with Salt humours chiefly, they then more readily display their Salino-Sulphureous Stimulus and communicate it to the Body. Hence Purging Resins are best given with Emulsions: And likewise it is advisable to mix the extract of Scammony or Jalap with a little of the same in substance, which we commonly do with good success. For it is to be noted that besides the Resinous, there lurk also Gummy parts in Jalap, which when precipitation is made come severally into sight by the evaporation of the decanted Liquor which is not very Purgative. Hence gather what is to be thought of that opinion of Lavaterus, who (*defens. Gal. p. 72.*) says he has been taught by experience, that the taking of a simple Infusion of Purgers does more than Extracts themselves, because he thought that the purging virtue of Medicines inheres more in the Salt than in the Sulphur or Mercury, for the Salt can never be mixed with Spirit of Wine, although in time it may draw something of a tincture from it.

LXVI. Many, imprudently enough, infuse a great deal of *Senna* and *Rhubarb* in a small quantity of *Liquor*, whereby all their virtue is so far from being drawn forth, that half or a fourth part of it is not. He therefore that is desirous to know both the quantity of the *Liquor*, and also of the *Purger* to be infused in it, 1. Let him have regard to the *Liquor* itself, whether it be pure, or imbued with the virtue of some other *Purging Medicine*, that may help or hinder the virtue of that which we are to infuse. 2. Let him consider whether the *Purger* be strong, and full of a *Purgative* virtue, or more or less destitute of the same from any cause. And seeing the *Physician* cannot know what such the *Purger* is which the *Apothecary* will make use of, the more prudent *Physicians* use to prescribe a little the more of the *Purger*, that if it have not its virtue intire, that want may be made up with using the greater quantity of it.

LXVII. But another error is often committed here by *Apothecaries*, whilst some infuse the *Purger* in the prescribed quantity of *Liquor*, others in a greater, and either take only a part thereof, or evaporate it too much; yea sometimes strain the *Purger*, and sometimes not: Whence any one may see, how uncertain the efficacy of such an *Infusion* must needs be. In the mean time many *Apothecaries* think they have *Licence* to do such things, whereby yet both the *Physicians* and *Patients* are imposed upon. Wherefore seeing it is impossible for a *Physician* to discover the particular custom of any *Apothecary*, which they often conceal, I had rather in my *Practice* prescribe either *Electuaries* or *Pills* than *Infusions*; seeing *Potions* also may be made of *Electuaries* dissolved in a convenient *Liquor*: And I have observed that I have prescribed *Physick* to my *Patients* with far greater certainty and safety than others.

Salivators.

The Contents.

- They Operate by opening and widening the pores of the Fauces, palate, &c. I.
- By fusing, melting and inciding the serous humours. II.
- Whether salivation by Mercury be an universal evacuation. III.
- Salivators evacuate the conjunct cause and relieve the neighbouring parts. IV.
- They are most proper when humours are settled in a part. V.
- Mercurial Salivation is performed by internals and externals. VI.
- In what form to be used. VII.
- To what parts Mercurials are to be applied outwardly. VIII.
- They root out rebellious Diseases. IX.
- Salivation is not therefore to be rejected, because it is a dangerous remedy, for it is safe enough, if rightly administered. X.
- Sylvius's way of raising a Salivation. XI.
- What diet is fittest in a Salivation. XII.

I. WE must suppose, 1. That this evacuation is owing to the *Serum*, whether we call it *Lympha*, or *Saliva*, or *Spittle*, or *Phlegm*, or by any other name. 2. That the glands are the receptacles of the *Serum*, or its frequent lodgings, channels and stay; and so that it is ordinarily, partly collected by this mean, and partly expelled for the uses of the *Body*; but that extraordinarily,

that is, preternaturally, it stays therein, is too plentifully collected, tends to Coagulation, and causes a tumour. 3. That in the *Lips* and *Fauces* there are not only infinite *Miliary* glands, but also many longer pores which gape into the *Mouth* partly with a Thousand holes, letting out their *Liquor*, and partly by branches or ducts, truly *Lymphatick*, but from their special use, or rather name, called *Salival*, out of which, according to the quantity of the *Lympha* it self, or its plenty and abundance, quality, thinness, fluidity or coagulation, clamminess or motion, there distills ever and anon more or less *Liquor* into the *Mouth*, which is destined to proper uses. 4. And so, that the *Mouth*, or *Palate* is an indifferent space for the reception of the *Liquor* that distills, and which it dispenses either by swallowing, and then it serves for a *Menstruum* to the *Meat*, or by spitting of it out.

Hence we say that *Salivators* do Operate both By opening the *Floud-gates*, and by dilating the *Pores*, that they may gape the more and let go from them what they retained, such as are those things that Operate partly by motion, partly by heat: Hence if one either roll a little *Pebble* only under the *Tongue*, or only move the *Tongue* it self to and again, the *Saliva* is drawn more plentifully forth, and that with a froth: Hence also in burning Fevers *Crystal* is put into the *Mouth* for asswaging thirst, as it uses by its actual coldness to allay burning and heat, that exhausts as it were all the dewy humour; which humour the *Crystal* being moved up and down in the *Mouth* draws thither. Likewise *Mastich* is very convenient for this purpose, because it both strengthens the glands, and affects the *Palate* by its grateful odour, and being in round pieces it is very fit for rolling to and again in the *Mouth*; whence we use only the granulated *Mastich* with the greatest benefit, which draws forth *Saliva* if there be occasion, to some Ounces, yea a pound in a few hours: Yea what things soever we chew, the same do also promote spitting by their motion, if there be any *Saliva* at hand.

II. Likewise by fusing, melting, and inciding the serous humours, that stagnate about the *Fauces*, so that they become apter for motion and exit, such as are hot and subtil things; whether *Saline*, as *Nitre*, *Lapis prunelle*, *Nitre Antimoniate*, and *Nitrous* things in general: For this may be observed as a rule, That all *Nitrous* things, and *Salts* also in general, make the *Serum* fluxile; whence these very things are not so convenient when the *Serum* offends in motion: Or *Sulphureous-resinous*, (mixed with *Acrimonious Volatil Saline* Particles) whether more explicit, or implicit: Whence hither belong *Tabaco*, *balsard Pellitory*, *Cubebbs*, *Lignum s.* whether in a dry form, or in a *Liquid*; *Watry*, as *Decoctions*, or *Spirituous*, as *Apoplectick waters*, for instance, in loss of *Speech*, &c. In like manner by fusing and draining the same humours in the whole *Mais* of *Blood*, and so in the whole *Body*, that they may tend towards the *Mouth* and there find an exit, such as in specie are *Mercurials* used divers ways. Indeed the manner of the Operation of these is in general the same and wholly falls in with the rest, inasmuch namely as they render the *Serum* Fluxile, and provoke it to those excretories, namely the *Fauces*: but in particular there are found in *Mercury Saline*, *Acetous* and *Sulphureous volatil* parts, which being received intimately, are actuated by the heat, and acquire a vehicle as it were in the *Serum* or *Lympha*, which therefore they more incite to motion, separate and fuse, so that by a restless motion as it were it seeks an exit for it self, and finds it chiefly in the *Fauces*, as being the most *Glandulous* parts. Hence *Mercury* purges and promotes a *Salivation* (which is as it were proper,

proper, specifick and peculiar to it self) while it is volatil, or possesses as yet a fumous Nature, but not so when fixed into a very dry Powder, because the heat whether of the Stomach, or even of the external members, if it be daubed upon them (made up into an Ointment) seems to loosen somewhat of its fumous substance, which ascending gently, in its passage provokes and calmly incites to motion the Phlegmatick humours impacted in the *Viscera*, and quietly settled there: And being once made Fluxile, their motion is furthered by the heat of the Stomach, Melaraick vessels, Liver or other *Viscera* and members, and they are expelled. Nor is this to be wondered at; for seeing by a gentle heat the same *Procreus* is willingly amalgamated, joyned and coagulated with Metals; why should it not, when communicated to our vital heat that is far more tender, and when rubbed upon our delicate Flesh, penetrate even to the Bones as it were, and insinuating it self in at the Pores, shew its efficacy very manifestly?

III. Hence Salivation by Mercury is become so famous, that being turned out as it were from the number of particular evacuators, it is advanced to the rank of universal; which may be granted so far, as the whole Body by a certain consequence deposits its ooze in these quagmires, the Glands, whence it may be called an universal Apophlegmatism: Yet it is not admitted into this rank save *secundum quid* (or in some respect) and therefore before the use and execution of this Salivation it is advisable to provide for the whole Body according as the case is, either by Purgers, or Bleeding, or which is better, by both.

IV. Now Salivators evacuate the conjunct cause, and relieve the neighbour-hood; or they are chiefly owing to those faults of the Mouth it self wherein the *Serum* re stagnates and is inclined to stay, whether in order to be heaped up, or to a slight Fluxion: Which thing happens in the tooth-ach; for which purpose Empiricks are wont to hold artificial Stones betwixt the aking Teeth: whence we may draw a corollary as it were, That Apophlegmatism and Masticatories are very good in the Tooth-ach. Likewise they are of excellent use for Scorbutical Gums and swelling Glands. So moreover, which is the other member of the Axiom, Salivators relieve the head chiefly. The former are more gentle, these stronger.

V. But they are more proper for the stagnating and rest of the plentiful *Serum*, than for its extravagant motion and deficiency. Hence they are good in all cold diseases of the head from a Phlegmatick humour, namely when the *Serum* coagulates and turns to Phlegm: But if it offend by a thin Acrimony and Fluxility, they are not so proper, especially if it be extravasated. Whence they are not good in a phthisical disposition or in the Heetick, in whom the *Serum* either fails or is infected: Nor in an *Asthma* (but with great caution) nor in spitting of Blood and Salt catarrhs falling down upon the Breast; nor in the Green-sickness, and disposition to Vomit: For as a spontaneous Salivation or spawling precedes Vomiting; so this artificial one may easily affect the Stomach, that when it is at hand it may be deduced into Act.

VI. Salivation by Mercury (*in specie*) is performed by internals and externals, and that either by one of them alone, or by both together. Mercury alone does all this, and indeed inwardly, the prepared: the more mild and frequently used is *Mercurius dulcis* to half a Scruple, or fifteen Grains, yea according to some to a Scruple or half a Drachm, given in a *Bolus* or Pills; but for a more violent and quick Salivation Red Precipitate, being freed from its too great acrimony by

washing it with Rose-water, in which case it uses to work both by Stool and Vomit at once: But outwardly this is done by *Crude Mercury* kill'd any way; but Anointing with Mercury is the most usual.

VII. Mercurials, to the end we may Salivate with them, are to be used neither in the form of Masticatories, nor of suffumigations: But in a Plaster or Girdle they are more mild. Nor in the form of Masticatories, because Mercury is an enemy to the Teeth and Bones; and so though it be a very powerful Masticatory, yet it is not safe: Whence though some make Masticatory Pills of a Scruple of *Mercurius dulcis* with a Drachm of Mastic and as much Honey as is sufficient, yet it is better not to imitate them. Nor in Suffumigation, because being resolved into vapour, it becomes more offensive to the Nerves: save that for a particular use, as for Venereal Ulcers in the Yard, Surgeons still use such Suffumigations. But Mercury is very frequently used in a Plaster, both for resolving and salivating; for Mercury does both; if it operate more mildly, it only resolves; if more strongly, it fuses and causes a salivation. *Empl. Vigonis* with Mercury is in great use for this purpose, increasing the Mercury to what quantity it pleaseth; this is much commended for *Gummata* and tumours of the Glands, and for pain, and it discuteth other hard nodes. In a Girdle it is either less or more prepared: If less, it is only kill'd with fasting Spittle and then spread upon some rough list of Cloth with some clammy substance (as the white of an Egg) to keep it on; if more, then other things are added, as they are in *Rulandus's cingulus sapientie*, which is an innocent remedy if rightly used.

VIII. The external use of Anointing, is either more universal, or determinate. Thus some command to anoint the Neck, Spine of the back, Breast, Arms, Belly, Thighs, the palms of the Hands, &c. But it is more advisable to use two places chiefly, the nape of the Neck for Plasters, and the Joints of the extreme parts for Anointings. Hence also in curing the Itch, sometimes the Wrist, the Arm-holes and Hams are profitably anointed with Mercurials. From which we further note two things, 1. That the remedies of the Itch and Pox are the same. 2. That Mercurials often do not Salivate, and yet cure the Symptoms.

IX. Mercury is a rooter up of the French Pox, and also of other Rebellious Diseases: For though it be a safer way to cure the Pox by Sweating, and more dangerous by Salivation; yet if the malady have taken deep root, it requires this latter way to root it out: So that as Noble Remedies are owing to Giant-like Diseases, so is Salivation owing principally to the Pox, both as to the whole distemper, and as to all its Symptoms as it were, pains, tumours of the Glandules, &c. But it has place also in other Diseases, as Madness, Falling-sickness, Gout, seeing it has been found by experience that some who have caught the Pox that were before all of some of the said distempers, have by one Salivation been cured of both. Yet hereby other remedies also are not excluded; only after having used Universals, Salivation is chiefly to be enjoined with Purging and Sweating. I knew a Gouty person so well cured by Anointing with Mercury, that he continued well for three Years; and though the Disease returned afterwards, yet it was far milder than before. Salivation has Wedel de place in Fevers if they be putrid, benign and *f. m. fac.* intermittent (yet *Fonseca consult.* 31. tom. 2. says p. 213. that some have cured a spotted Fever thereby.) Continual Fevers have been observed to terminate in health several times by a critical Salivation. Others have observed it to profit in a Quartan.

W.

We have seen a stubborn, refractory Head-ach cured by a light artificial Salivation. I was of opinion, that a Sympathetick *Vertigo*, caused by a consent with the Hypochondres, that had continued for a long time, returning by intervals, and yielding to no remedies, might be cured by this remedy: And upon tryal the event answer'd my opinion and desire. The Mad are cured by this means; the Melancholick disease may promise it self a cure from hence. I have Cured not one but many of the Falling-sickness this way: I only mist twice of my expectation, when the malady was hereditary and deep rooted. The Gout expects help for preservation from hence; a stubborn Itch, yea even the more gentle gives place to it: Frequent experience witnesseth, that long continuing, yea Ancient Ulcers of the Legs are cured by a prudent Anointing, and even by a light Salivation. The Spontaneous solutions of the said diseases have given occasion to think of such a remedy. ¶ In fenny *Holland* a Salivation, like a most faithful Crisis, does for the most part terminate even the most violent Fevers, namely the Flox-pox: and sometimes the most stubborn diseases of an obstructed Spleen, in whom such Salivation continues sometimes above a month. ¶ A young Man born at *Lyons*, (Monf. *Tambaras*.) about eighteen years of Age, falling into the Small-Pox at *Geneva*, 1670. happily escaped from them by a plentiful Salivation that continued for eight days.

Tulp. obs.
33. l. 3.

X. The cure by Salivation seems to offend against the Laws deliver'd by *Aesclepiades* and *Galen*; for it is neither quick, nor safe, nor pleasant: Not quick, seeing it continues above twenty days: Not safe, in respect of the matter and effect; Mercury is a dangerous Medicin, as being poisonous, as also the Medicines prepared of it; for Red Precipitate is corrosive: grievous Symptoms follow Salivations in the Mouth and *Fauces*, Erosions in the Palate, the Heart suffers Anxieties, there is sometimes so great a Flux of the Belly, that it becomes Bloody, &c. I answer, 'Tis granted that here is a failure in the shortness of the cure, but too great haste uses to be dangerous: We should not have more regard to the speediness of the cure, than to perform it as we should, without defect. There may a twofold security be assigned, one that is such simply, and another *secundum quid* (or in some respect.) In the cure of the French-Pox, and other diseases, an absolute security is not always to be lookt at, but sometime such as is joyned with danger: He that has too great regard to security, fails in the generosity of the cure: And it is a very hard thing to find a generous remedy that profits greatly and does no hurt. I grant that Mercury is a dangerous remedy in some respect, not simply: Many bear witness that it has been taken in substance crude without harm: I deny that all the preparations of it are dangerous, if they be rightly prepared. Suppose it cause grievous Symptoms, what then? An inveterate Pox cannot be rooted out with milder things, as *Guaiacum*; the *Fauces*, Palat, Gums, Stomach, Guts suffer, that the whole Body may not perish, and that other parts, of what kind soever they be, may be eased of their burden. Many diseases become incurable by accident, 1. By the fault of the Patients that will not admit of generous Remedies. 2. By the fault of the Physicians, that through fearfulness and unskillfulness do not prescribe generous Remedies. The pleasantness of the cure is sometimes to be less regarded.

XI. As a spontaneous and critical Salivation often happens to the benefit of the Sick; so it becomes a prudent Physician sometimes to attempt the like artificial one. I confess that Salivating by Mercury is often undertaken in the

cure of the French-Pox; but Salivation ought likewise to be rais'd in the cure of other obstinate diseases, as suppose of a foul Scab, and in other diseases that depend on a glutinous and acrimonious humour mixt with the Blood, and intimately received into most parts, and which have eluded the vertue of vulgar Remedies. Now Mercury is used sometimes crude, sometimes first sublimed or precipitated with Sulphur into *Cinnabar*, or with acid Salts and Spirits. Crude Mercury being first killed with Spittle or by other means is often mixed with some sort of Grease, with Butter or Ointments, and then it is anointed outwardly on the Body; whereupon after the Anointings have been repeated for some days there is rais'd a Salivation in some sooner, in others later. The safest places to Anoint are the extrem parts of the Limbs, the soles of the Feet and palms of the Hand; then the Wrists and Ankles, next the Hams and Elbows, afterwards the Groins and Arm-pits; lastly the Spine of the Back, especially about the Loins: Taking heed that neither the Head nor Breast be Anointed, seeing it has been observed that Patients have been brought into danger of their lives thereby. We must not Anoint too freely, but must take strict notice what changes happen in the Body upon it, whether disturbances of the Belly, or motions of the humours towards the *Fauces* and Mouth. The Patient must be kept in a warm Room, and have cloaths enough laid on him, so as his Body may be disposed to Sweat. For it is profitable that he should Sweat gently, for hereby all the humours and especially the Glutinous and Phlegmatick seem to be dissolved, and made apter to be wrought upon by the Mercury. Phlegmatick humours are thickened by cold and made unapt for motion; the contrary is to be expected from warmth. We must continue, according to the strength or weakness of the Patient, to Anoint every or every other day, till the Gums begin to swell, and the Jaws (or *Fauces*) to ache and burn, and the breath to stink: which is a sign that all things accommodate themselves to the following Salivation, and that it is at hand. Then we must cease from further Anointing, lest too great a Salivation follow and such as may be apt to strangle the Patient. Some use crude Mercury inwardly also for the raising a Salivation, giving daily six, eight or ten Granes of it till a Salivation be rais'd by degrees. And then we must abstain from the farther use of the Mercury, unless after two, three or four days the Salivation proceed more dully, in which case we not only may, but must give more Mercury. But when it is rais'd high enough, we must take heed of using any more, for thereby the Glutinous and offending humours might be carried in too great quantity to the Salival Ducts and Glands of the *Fauces*, and the Patient might incur danger of his life through suffocation. Certainly there is need of great discretion in the using of Mercury, seeing by it the Phlegmatick Glutinous humours and others that are mixt with the whole Mass of Blood, yea dispersed all over the Body, are wonderfully moved, and driven forwards chiefly to the *Fauces*. But then crude Mercury may be killed divers ways, by Spittle, the juice of Citron, or other things; then may be made up into Pills with Agarick, Rhubarb, Aloes, Scammony, Coloquintida and other Purgers added to it, and so may be given in a small Dose every day till the Salivation shew it self at hand. Where note always that 'tis best to keep the Patient in a warm Room, yea in Bed, that he may continue in a kind of Sweat, for so the Salivation is facilitated. Salivation is not rais'd only by crude Mercury whether used outwardly or inwardly, but by the same first coagulated and prepared divers ways. Amongst the various pre-

lib. 1.

parations of it, that is not the worst, whereby being boiled with Sulphur it is sublimed into Cinnabar, which is used by way of Suffumigation. Now the fume is received either by the whole Body, or only by the Mouth: By such fume penetrating through the Pores of the skin to the inner parts, the humours wheresoever existing, (Phlegmatick, Glutinous and Acrimonious) are dissolved by little and little, and brought to a Flux, and are directed by degrees to the Salival glands of the Mouth, upon which a Salivation follows, which is caused more happily this way when there are Ulcers in the external parts, which grant a more open passage to the fume and by it are the sooner cured. Salivation is raised by a particular fume received in at the Mouth by a funnel: Which way of using Mercury I esteem to be the safest of all, and yet nevertheless very fit for curing diseases that are not too inveterate, and so very hard to cure. For this way a moderate Salivation is raised by degrees without any danger of suffocation; for so much Saliva is drained forth at every time, as any Patient seems to be able to endure well. Yea if this way be used in Summer or other warm season, it permits the Patient to go abroad, so that none but such as are well skill'd in the matter can take any notice of it: Namely a little Cinnabar (joined with Mastic, Frankincense, Benzoin, Myrrh, Amber, Laudanum and other things) is cast upon the coals daily or every other day, then setting the wide end of a Funnel upon it, the Smoak is received into your Mouth through the small; whereby a slight Salivation is raised; which afterwards is renewed, unless it continue of its own accord. To raise a Salivation, as well Sublimate as Precipitate Mercury is used: But such precipitate must be chosen as is least fixt; for all Evacuators prepared of minerals, the more fixed they are made by their preparation, the less do they evacuate the offending humours any way; and the less fixed they are, they evacuate the same more largely and plentifully, yea and also more violently. When the same are most volatil, they expel the humours more easily by Salivation, so they be given in a very small Dose at one time. And we must take heed lest the Phlegm be hurried too fast and in too great quantity to the Salival Glands, seeing there is danger of a Suffocation from thence, whilst not only the conglomerate maxillar glands, both upper and lower, are filled and made to swell thereby, but also the whole Glandulous coat of the Mouth, Fauces and Nostrils is then filled with the same Phlegm, and being distended produces a dangerous and sometimes deadly straitness in the Fauces, that choaks Men.

XII. During the Salivation as it is hard to take food that is solid; so if it were taken, it would do harm, and instead of it 'tis more profitable and fit to use sweet Milk and Broths, as also Beer warm'd with a Toast; with the addition of a little Sugar, if it like.

 The opening of that which runs betwixt the Corners of the Eyes. CVI.
 If Leeches be applied to any part, let not their number be too few. CVII.
- I. Whether it is convenient on any account to let Blood in every Disease and Fever? Many are the benefits of Blood-letting, for which it is celebrated in every Fever, and sitting disease. Some open a Vein for this reason, that part of the aliment may be withdrawn; for then Nature is more at leisure to turn her self to the Disease, and setting upon the concoction of the Morbifick cause, in a short time conquers it: On this account fasting, and thinness of diet are so much commended. Blood is also profitably let for opening obstructions and hindring putrefaction (9. meth. 4.) Yet distinguish the cause of Obstruction; for if plenty of Blood cause it, bleeding is profitable; but if the quality of the humours, the use of attenuaters is beneficial. It is also profitable in long continued obstructions of the Liver from a matter that is thick, viscid and hard to move, because bleeding does agitate the humours, so that those which are stufft up in the Liver receive a motion, and more readily obey a purger. And though attenuation be performed by Aperients, these when they are too hot, heat violently: Wherefore that we may procure that motion to any humour that is necessary for the purging it off, it is better to use Bleeding than too hot Medicines. Blood is often let also for tryal, in which case a little only is drawn forth, that we may discover by it what humour offends, in order to purge it off. Thus in a Quartan Ague it is usually black and Thick; for if it be thin and of a bright Yellow in a Quartan, or in Melancholy, we must stop it presently. Bleeding cools also, because it draws forth an hot substance. Therefore there are several benefits from bleeding in every disease, so that there hardly seems to be any, wherein its use is not to be admitted, if not upon the account that it evacuates, yet because it diverts, cools, opens obstructions, minorates, moves, or subtracts aliment, or for tryal as aforesaid.
- II. Because Venesection is used for evacuating Blood, and Blood is profitable to Nature; it will behove us rightly to administer it, so as that it may let out what is unprofitable to Nature. Now Blood becomes unprofitable to Nature two ways; either when it does not exactly keep its proper quality, nor can nourish any longer as it did before when it was profitable; or when it hath so increased in quantity, as either to oppress the faculties, or to distend, or burst, or obstruct the Veins and Arteries. And in these truly bleeding is profitable, as one of the evacuating remedies: in others, inasmuch as it calls back the too vehement impetus of the humours to a contrary or different part, Gal. 9. or derives it sideways. ¶ If matter either be wanting, or be intire, bleeding is improper; but if it either offend in its quantity, or be corrupted, it is helped no way better. Likewise diseases of the Viscera, resolution, stiffness and distention of the Nerves; lastly, whatsoever does strangle the Throat with difficulty of breathing, or suddenly suppresses

suppresses our Voice, calls for bleeding. So does any intolerable pain, and when any thing is broken or bruised within from whatsoever cause. In like manner an ill habit of Body, and all acute diseases, that hurt not through weakness, but oppression. Yet it may so happen that the Disease may indeed require it, and the Body seem not to be able to bear it. But yet if there appear no other remedy, and the sick Person be ready to die, unless he be relieved some rash way; in this case a prudent Physician will shew how little hope there is without bleeding, and withal confess what great hazard there is in it also; and then at last, if required, to let Blood: For it is better to try a doubtful remedy than none. And that ought chiefly to be done when there is a resolution of the Nerves, when one is suddenly struck dumb, when one is strangled with a Quinsey, when the last fit of an Ague almost kill'd the Patient, and 'tis like the next will be as bad, and his strength seems unable to sustain the assault thereof.

Celsus,
l. 2. c. 10.

III. When the Blood that comes forth is greatly corrupted, 'tis a sign there is great want of good Blood: Which greatly moves our common and unlearned Physicians, and invites them to let Blood again and again more largely and profusely; but makes the skilful more wary, because such as labour under so great a *cacochymy* being once debilitated, have not where-withal to be recruited; and in the mean time they are nourished by their own Blood though bad. Being left to themselves these latter are against bleeding in such a case; and if they be over persuaded to it, they will advise to do it sparingly.

Vallef.
meth.
med. l. 2.
c. 4.

¶ Yet we sometimes observe that bleeding does good in an intire and compleat *cacochymy*: But then it must be moderate; and let it be performed by little and little at a time, repeating it often: And in the intervals use altering and strengthening Medicines, and meats of easie digestion, as we know Galen did. I knew one that was Physician to the King of France change his own ill habit of Body thus, letting himself Blood Fifteen or Twenty times in a Year. ¶ Though in bleeding when there is such a *cacochymy* of the Veins, all the humours issue forth equally, and there remain one and the same proportion of the humours; yet because when part of the load wherewith Nature was burthened is with-drawn, the faculties become never the weaker, but rather more brisk, they better bear that which remains, and more easily tame and consume it.

Walæus,
m. m.
p. 72.

Fernel. m.
m. l. 2. c. 4.

¶ I deny not but many Diseases that spring from a *cacochymy* are happily cured by Bleeding, that is, as I interpret, that it is used with profit amongst other Medical remedies. For part of the vitious humours are with-drawn by it, and so Nature is eased of part of her Burthen, so that afterwards she corrects more easily what is capable of correction, and being helped by a purging Medicine more readily expels what is fit for excretion. Now this emolument is then to be expected from Venesection, when either the *cacochymy* abounds chiefly in the outer Veins, or is equally diffused through all: For if it be in the inner, as being remote and larger, you shall indeed take nothing away from the *cacochymy* by opening a Vein, but shall however deprive Nature of her more laudable Blood: Which thing whether it will turn to the advantage of the Patient, any one understands. Moreover, if a *Cacochymy* as such does of it self indicate Venesection, then it shall be administered in all diseases that spring from a *cacochymy*: But do you open a Vein in a bilious *cacochymy*, and what disturbance you will raise, the event will teach you sufficiently. If you order the same in a Phlegmatick *cacochymy*, you shall thereby increase it the more, and shall precipitate the Body into a cachexy, and from that into a Dropsie. The rea-

son why bleeding is useful for the Mad, is because their fervid Blood is partly cooled by it, and partly hindered from rushing so impetuously into the Head. To undertake by repeated Venesection only, to bring forth those vitious humours that cannot be taken away by Purgers, I think to be full of danger: For in my opinion the Blood may be safer defecated or clarified by diureticks and hydropicks. ¶ As to bleeding in a *cacochymy*, I for my part do not defend it: Only this I would admonish you of (of which you are not ignorant) that Nature often uses to drive forth Vitious humours to the external Veins, whence by opening a Vein in Fevers a good part of the *cacochymy* is often happily taken away: As also of that which F. Platerus (Ty. 1. Pract. P. 143.) alledges, that in the Mad and Melancholick a *cacochymy* has often been taken away by repeated Venesection. ¶ I add; pray let you and me consider, Whether Practitioners oftner open a Vein in the *cacochymical* or Plethorick? I think that of ten which are Bled, you shall hardly find One Plethorick for Nine *cacochymical*: And yet these things are done daily, and that by the advice of Physicians, and not always with bad success. The reason wherof I think to be this: Nature being solicitous for Man's health, always takes care to expel from the Royal way of the Body (or Vitals) whatsoever vitious humours there are, either to the first ways (or guts) or to the Superficies of the Body, and so to keep the Noble *Viscera* safe: Hence from the expulsion of vitious humours there arise Scabs and Infinite kinds of Tumors & Tubercles. But before the Matter bursts forth in the Surface of the Body, it abides in the Veins of the Limbs: Whence when we open a Vein, often hardly the fourth part, of that which comes forth, deserves the Name of Blood. Therefore seems it not more advisable by opening a Vein to evacuate the *cacochymy* out of the Veins in the Limbs, whither it is driven forth by Nature, than by purging to recall it into the inner parts of the Body again, and to defile or taint the *Viscera* if it be not all of it evacuated? *Idem Epist. 92.*

¶ All Physicians agree that a *Plethora* or Plenitude is an excess of sincere Blood, that is, of such as is fit for the nourishment of the Body; and that a *cacochymy* is a redundance of Vitious humours, and that purging is a convenient way to expel and bring forth a vitious humour lodged in the Body: But most Physicians affirm, more importunately than truly, that a vitious humour is not to be drawn forth by such a kind of Purgation as Bleeding, but by purging by stool, by vomiting, by sweating, &c. yea, they say, that by these means, only that which is vitious and unprofitable to the Body is expelled, but by bleeding that also which is profitable is drawn forth, Nature, namely, not separating hereby the unprofitable from the profitable, but suffering whatsoever is contained in the Veins to flow out indifferently, as well the good as the bad, whence there is more harm than benefit. But if a *cacochymy* be distributed through the whole Body, as all are of Opinion, 'tis certain, that 'tis partly contained also in the Veins of the whole Body. And I pray, by what Art, or what kind of Purgation can the vitious Blood that is in the Limbs, be purged off? 'Tis weak to think it can be done by stool; and more foolish to believe it can be done by vomit, or coughing, or by Urine, though all these are sometimes profitable in Diseases of the Limbs, but that only by accident, namely, because thereby is taken away some part of the humour that might feed and increase the *cacochymy*, and consequently the said Diseases. For there is no retreat granted to the humours from the Limbs to the said Emissaries, except in deadly evacuations, as in a vehement *diabetes* almost all the Serum, and in a great looseness all the humour of the Body almost may be poured forth. Therefore seeing a *cacochymy*

M. Do-
ring.
Ep. 80.
Cent. 1.

Sennert.
Epist. 85.

Idem Epist.
92.

my lodges not in one part only of the Body, but possesses almost all of it, it is to be evacuated out of its various parts, namely out of the Veins what is contained in them; that which lies next under the skin, by scarifying, or sweating, or insensible transpiration; by Stool, what is seated in the Bowels and thereabouts; by Vomit, what is contained in the Stomach; by Urine, what in the Kidneys; by blowing the Nose or Coughing, what burthens the Head or Lungs; and in a word, from every part is its proper burthen to be unloaded; or however from that which is next to the part affected, or is most fit.

Therefore in a *Cachexy*, that is, an ill habit of the whole Body, purgation is indeed necessary, but not only that which is done by Catharticks, but rather that which we attempt by Bleeding: For that the Blood may be purged by opening a Vein, the effect it self teacheth, seeing we observe that thereby many cachectick persons have been restored to a good habit of Body from a very bad one, and have been continued therein for many Years. None was ever seen to abound with a greater and more stubborn *Colluvies* of humours than my Brother, who was freed beyond hope from a very grievous *Palsie*, and a *Convulsion* of another part, twenty four years ago; and presently after being seized on by a Malignant scab, from which he could be freed neither by Purgings, nor Baths, nor Anointings, &c. he was not only cured of his Scab by Bleeding often repeated against the advice of his Physicians, but brought to a better habit of Body than he had before. I my self also being so cachectick from a *Quartan Ague*, that I was not a little afraid of a *Dropfie*, was restored by no other remedy (though I first tried to do it by Purgings, *Apozems* and Diet) but by repeated Bleeding. My servant *Henry* escaped from a pestilential Fever by being thrice let Blood by my direction; but a languid, sweating Fever remaining, which seemed to tend to a *Leucophlegmaria*, I let him Blood four times, taking a pound each time, whereby he was recovered in about twenty days, and is now in good health, and Married. There was so great a *Colluvies* in his Blood as I never saw before, for in one (medical) pound there were at least ten ounces of *Serum*, and more than an ounce and half of thick and very tough *Phlegm* swimming a top, and about half an ounce of very black and corrupt Blood subsiding.

I have handled several in like manner, to whom many Physicians thought that Bleeding would by no means be beneficial, but Purgings, according to the common opinion that purging is owing to a *Cacochymy*, which opinion were true, if they added not, [and not Bleeding.] Yet from the Instances alledged I would not have it infer'd, that all Bodies that are Cachectick and of impure Blood, are to be so treated; for the impurity of the humours that reside in the Intestines, ought by no means to be comprehended under the name of a *Cachexy*. But as I would not that these examples and others should be esteemed as Laws; so neither is it fitting that they should be rejected as unprofitable, and estranged from art; especially seeing all art proceeds from experiments, and universals themselves are derived from particulars. Wherefore if this opinion of mine, that is said to be repugnant to *Galen*, be to be received, it ought to be confirmed and strengthened by the chief Authors of art, by *Galen* himself, *Hippocrates* and others of any note. In what I pray does *Galen* seem to contend more against *Erastistratus*, than in shewing his evil mistake that Bleeding was profitable only in a *Plethora*? He himself used this remedy in his practice; for *g.m.m.c.5. & l. 11.c.15.* he bids us cure all putrid Fevers by Bleeding, and if they be continual, as the *Synochus pu-*

trida, he bids us Bleed freely. Now it were foolish to think that in these a *Plethora* only offended. And when he said that Blood might be let even in those putrid Fevers both on the seventh day and twentieth, and later if other indications were answerable, did he think that these Bodies were *Plethorick*? Moreover did he think that Woman *Plethorick*, of whom he speaks, *6 Epid. comm. 3.* that was spent and wasted by a long Disease? And yet he says he let her Blood thrice, three days one after another, and gave her no Purgers. He hath confirmed the same by precepts; for *XI. m.m.c. 5.* says he, *If in an hot and dry constitution, with the offending of some humour, there be raised a Fever through many thick and glutinous humours, Blood is to be let; that the offending humour may the more easily transpire.* Further, *If the Body be straitned, and the little passages condensed, and withal there be many and clammy humours lurking, in such a complication of causes as this, it is convenient to begin with Bleeding.* And *9 meth. cap. 10.* he says that, *a large evacuation of Blood is dangerous if it be made altogether, the faculties being weak, with a corruption of humours, wherein, he says, when the indications are so cross to one another, we must evacuate by little and little what is vitious, and by degrees also fill up its room with that which is wholesome.* Which form of cure *Celsus* describes accurately thus (*lib.3. c.22.*) *If there be a bad habit of Body, which the Greeks call a Cachexy, we must first use a spare diet, then Purge; and if other things do no good, we must Bleed, but by little and little and daily.* And in the chapter of Blood-letting he affirms also, that it is profitable in a bad habit of Body; and he says, *In an abundance of Blood, or in the corruption of it, the sick can be relieved by no remedy better than by Bleeding, yea by Bleeding till the Blood come out pure.* Now let us hear *Rhasis*: *If Melancholy*, says he, be accompanied with a pain and inflation of the Belly, and the colour of the Body be vitiated, if there be a bad concoction, vomiting, acid belchings and plenty of flatuosities, we shall begin the cure by opening the Axillar Vein, or the Vein by the little finger in the left hand. A *Cacochymical* Body cannot be described more clearly. Who will not call *Splenetic* persons inclining to a *Dropfie*, *Cacochymical*? yet *Hippocrates lib. de affect. num. 21.* says that the *Splenetic* Vein is often to be opened in such. Therefore *Galen* did not do well to conceal Bleeding when he propounded the remedies of a *Cacochymy*, especially seeing you will hardly find any chronical disease, though very small, or any acute or new one that is great, without a *Cacochymy*. For sick bodies when they have occasion to be Physick'd abound with vitious excrements. Add, that almost all the bodies wherein *Hippocrates* commands Bleeding, are to be esteemed *Cacochymical* not *Plethorick*, as may be known by the instances. If the Blood therefore be unprofitable, as *Galen* says *9. m.m. 11.* when it keeps not its proper quality exactly, nor can any longer nourish the Body as it did before, Bleeding is not only not to be contemned in a *Cacochymy*, but to be greatly commended. But yet it is so to be divided, that by often repeating the same (as *Galen* and *Celsus* teach) that which is corrupted in the Veins may be drawn forth the greatest part of it without injuring the faculties; I say the greatest part, because it is neither convenient, nor possible to art to take away all: But the residue, as *Galen* often says, does transpire the more easily, or is expelled by the assistance of Nature. *Leon Bo-*

tallus lib. IV. Why are we so much against Bleeding in a *Phlegmatick plenitude*, if the *Phlegm* by further per *f.m. elaboration* being turned into Blood do strengthen the faculties, and supply the want of Blood? This happens on divers accounts. 1. Because seeing the mouth of the Stomach is the receptacle of *Phlegm*, the same is often likewise hurt, where-

by,

by, as also because of the vicinity of the Heart, there follows a *Syncope* or swooning, as appears in the *Syncope* Fever. 2. The coldness of the Phlegm is very adverse to Nature. 3. When Phlegm by its plenty overcometh Melancholy, it dulls, extinguishes and suffocates the innate heat: For seeing Phlegm is a crude humour; when it abounds in the Vessels, it hinders the access of the Blood to the parts to be nourished. 4. Seeing Phlegm may obstruct on three accounts, both by its quantity, thickness, and roughness or clamminess, in an obstruction arising from these causes, there is an hindrance of a sufficient transpiration of the Air to nourish the Spirits, from a defect whereof springs a weakness of the faculties.

Thom. 2.
Veiga 1.
de diff.
febr. comm.
3.

V. In a *Melancholick plenitude* we may Bleed more largely and boldly, 1. Because the Melancholick have much hot Blood, for the ventilation and evacuation whereof Bleeding is very available. 2. That humour though it be thick, yet is not clammy, which clamminess seeing Phlegm partakes of, and thickens more to the Vessels, it is not so readily brought forth with the Blood. 3. By evacuating the Blood the Melancholick humour is likewise evacuated, because it is the *flex* or dreggy part of the Blood; but so is not Phlegm, nor any other crude humour. 4. Natural Melancholy is more agreeable to the nature of the Blood than Phlegm is, seeing it is generated by a temperate heat; but so is not Phlegm, but by a diminished heat. 5. Melancholick Blood is thick, and can neither be consumed by abstinence nor bathing: therefore it ought to be evacuated by Bleeding, as *Jacchimis* says *pr. c. 15*. 6. Because Phlegm, if it stay long in the Body, may be corrected, and turned into Blood by further Concoction: But Melancholy cannot pass into Blood, and by staying long in the Body, becomes *atra bilis* or black adult choler.

Zacut.
princ. med.
hist. lib. 2.
hist. 78.

VI. *Avicen* 4. 1. c. 20. forbids Bleeding in a great effervescence of choler: *When the Urine is thin and Fiery*, that is, is very Choleric, we must have a care how we Bleed. For if we Bleed, a victory of choler and an effervescence thereof is to be feared; because when the Blood is extracted, which is the bridle of the bilious humour, choler prevails more. This opinion of *Avicen*; that is exploded by many, is agreeable to the doctrine of *Galen*. For he says (*comm. in 6. Epid. f. 3. r. ult.*) *An impediment in those that spit Blood, is the season of the year, a pleurisy, choler*; where by impediment he means a prohibition of Bleeding. Therefore redundancy of choler, even in a disease that requires Bleeding, hinders it. The same (4. *de san. tu. 4.*) says that, *when the humours recede a little from the nature of Blood, we must let Blood boldly; but if further, then more warily; but if very much, we must take away none at all*. Likewise 9. *meth. cap. 5*. reckoning up the indications that dissuade from venesection, he abstains therefrom when the mouth of the Stomach abounds with bitter choler. Also 2. *ad Glauco. 2.* he forbids it in an exquisite *Erysipelas* and *Herpes*. The same he does in an exquisite Tertian (1. *ad Glauco. 9.*) And he gives the same advice in every other distemper that is the offspring of a bilious fluxion, and where choler recedes very much from the nature of Blood; for in such there is not a due strength of the faculties. And on the same account fasting hurts, because in the defect of alimental moisture, such Bodies being dried wax hot. So by Bleeding they are more dried and inflamed, and the humours ferment more. For the same reason *Galen* (1. *ad Glauco. 14.*) says that Bleeding is to be feared in climates that are excessive hot. He teaches the same 11. *meth. 4.* especially if the Blood be little and the choler very much; for though the humours flow out promiscuously, and abide in the same proportion in the vessels, there follows an evident

harm without benefit, because a great deal of Blood is let out for a small quantity of choler, and the vertue that ought to rule the bilious humour is dissolved; which humour being no longer under Natures government, does thereupon ferment and putrefie. But *Avicen*'s opinion is to be understood when the bilious humour is either in the first region of the Body, or in its *Ambitus* or surface: For the Veins being emptied by Bleeding, instead of the Blood that is let forth they snatch the bilious humour out of the first region of the Body, or from its habit, by the admission whereof the Mass of Blood is defiled and made more acrimonious: In which case Bleeding cools not, but heats; and Purging should be used instead of it, or at least go before it. Thus *Hippocrates* and *Galen* 4. *acut. 1.* admonish us, that continual Fevers are caused through the Veins being drained in the Summer time, and drawing acrimonious humours to them: And 1. *Epid. 2. comm. 20.* he says that Tertians spring from choler heaped up in the *genus carnosum* or fleshy parts. For then, when there is a *Cacochymy* in the habit of the Body, the Veins being emptied and dried through heat, are yet further emptied by letting Blood, and by the attraction of acrimonious ichors the heat becomes unbridled, and the choler effervesces, with fear left the raging choler, being thin and hot, should by its restless motion come to fall upon some principal part, &c.

hist. 63.
lib. 1.

VII. When the Blood it self is redundant, it is most powerfully and quickly lessened by Venesection; which benefit one shall in vain expect therefrom in the redundancy of other humours. For though by Bleeding the Serum be lessened in the Body together with the rest of the Blood, yet it is not lessened in that respect that it abounds. Now the Serum is said to be redundant in the Body, when there is more of it generated and heaped up therein, than its natural proportion with the rest of the Blood requires. Therefore when Serum is to be lessened, we must not think that it matters not though the Blood be diminished withal, whose proportion is then changed, and indeed so, that we should rather wish that the other parts of the Blood, besides the Serum, could be increased, than that they should be lessened together with the Serum.

Sylv. de le
Boe Ap-
pend. tract.
6. §. 156 &
seqq.

VIII. Blood is esteemed the greatest darling of Nature, by whose help she performs all her operations, and which we can hardly withdraw from her without prejudice: Yet art requires that those who will have to do with this darling, neither being bold nor fearful, but prudent and courageous, proceed to Venesection, being moved by no other reasons save these four. 1. Because of a *Pléthora*, that Nature may be eased of too great a burthen, and the natural heat preserved from suffocation. 2. To revel the Blood and other humours that are mixt with it, namely when by hastening to this or that part by too great a Flux, they hinder the cure. 3. To derive the Blood some other way that is already slid into any part, though it have as yet no fixed seat there, nor be extravasated. 4. To cool it, when it is inflamed with so great a heat, as can be slackened neither by cooling Medicines, nor by time. But some think that they are too much straitened within these bounds, desiring that corruption of the Blood should be an argument for Bleeding as well as the four reasons already rehearsed; that Nature being eased of a portion of the corrupt Blood, might the better correct and amend the remainder. But I would greatly desire, 1. That this evacuation may be made without prejudice to the faculties that are so necessary. 2. I would have them when they are by the Bed of the sick person, accurately to shew to what degree of corruption the Blood is already come, that thence it may be known,

Nnnnn

how

how much is to be taken away by Venesection, and how often; because Bleeding is not permitted in all putrefactions of the Blood, but only in that wherein it is not as yet come to any high degree.

3. They ought to shew manifestly for what reason they would have a greater corruption cured by Purging, but a less by Bleeding, seeing they give the true name of a Cacochymy, to this latter as well as to the former: I say, let them shew that things differing only *secundum magis & minus* (or gradually) do differ specifically, and therefore require a remedy different *in specie*.

IX. Whether a putrid humour be to be evacuated by Venesection, is not hard to resolve with those that advise bleeding in every Disease. But I say, if we must not depart from the rules of *Galen*, that no where in his Doctrine can it be found that this humour can be evacuated by opening a Vein, but either by purging Medicines, or by vomiting, or by diureticks, or hydricks: See the 7. & 8. Cap. of *Lib. 11. m. med.* If you say, how will the putrid Blood be evacuated in a *Synocha*, or also excrementitious humours distant from the Nature of Blood, when they are mixed with it? I answer, that the putridness of the Blood in a *Synochus* may be consider'd, either as the Blood as yet keeps its goodness, or as it has wholly lost its proper form. In the former case, it is not properly putrid, though it is beginning to degenerate; in which case we may let Blood for a plenitude, and for obstruction caused thereby. In the latter case we may not, 1. Because in such a corruption the faculties are not strong; 2. Because the Multitude (or *plethora*) hath degenerated into a cacochymy, which a purging Medicine corrects. And let the same Judgment be past upon the humours mixed with the Blood: For this mixture is made with the Blood two ways, either with a multitude of it, or without. The first admits bleeding, not on the account of the mixture, but by reason of the Plenty of Blood, that part being evacuated, Nature may preserve the rest from putrefaction. The Second does by no means require this remedy, seeing that only is to be evacuated that gives trouble to Nature, but such Blood gives none, why therefore should it be evacuated? Why will it like you to empty a Pound of good Blood, by opening a Vein, that you may bring forth an Ounce of excrementitious Choler mixed with it? How much this way of cure differs from the Opinion of the Ancients, this may witness in a special manner, That purgers bring some one kind of humour out of the Veins, and this is called properly to purge, that is, to chuse one thing that is mixt among many, and make it purer. I know that it is the opinion of some, that Venesection is always convenient when excrementitious humours are mixt with the Blood; but by what has been said, 'tis clear they are mistaken: And no less so are those who seeing the Blood corrupted, viz. bilious, craginous, or otherwise tainted, brag that it was well they took a great deal, and itch to be repeating Venesection every day, as if they were some common slaughter-Men. But *Galen* did not do so, who when the Blood was bad, in a time of Scarcity, forbade venesection; observing, that all those died who were bled upon an indication taken from a putrid humour.

X. A Man of fifty being cacochymical, and subject to great obstructions of the *Viscera*, having without purging first, or without any necessity or advice of a Physician, caused his right Cephalick Vein to be opened, having been at a great Dinner the same Day; on the following there rose a pain about the place of Incision, that was dull at first, but increasing and becoming more vehement by Degrees, there followed a great afflux of Serous humours, so that all from the shoulder to the Fingers ends was incredibly swelled, with Inflamma-

tion and Pustules every where bursting forth, out of which a ferous and acrimonious humour flowed in great plenty, so that a Gangrene was at hand; yet he was cured by the efficacy of Remedies. Hence it is clear how dangerous it is to move any thing in impure Bodies.

XI. Those who have the passage of Gall implanted into the bottom of the Stomach, and for that reason vomit choler daily, are troubled with a Nausea and bitterness in their Mouth, and are in continual Affliction, according to *Avicen* are not to be bled, because by bleeding the Choler returning to the Veins becomes more hot and boiling: Especially seeing the Faculties are not strong in these, seeing they endure great pains and gnawings at their Stomach, are seized with *Cardiogni*, swoon, are tormented with thirst, are convulsed, want an appetite, nauseate and are often taken with an inflammation of their Stomach.

XII. Not only plenty of Blood, nor the Extraneous or Elastick parts that are mixed with it, do cause it to have an *imperius*; but the Vessels that contain it do often incite the circulation. The story that *Dr. Willis* tells of a Woman that he had under cure, sufficiently proves that the Blood-vessels do stir up the Liquor they contain to an unusual and vehement motion. That Woman had been long troubled with a cruel Colick pain, joined with Convulsive motions: He order'd her, because of the greatness of her pulse, to be let Blood to four ounces out of the Jugular Vein, out of which the Blood issued with great violence: But being taken with an Apoplexy a few hours after, she died. Her Body being opened there were hardly to be seen four ounces of Blood remaining: So that it is hardly consonant to reason that from so small a quantity of Blood so strong and frequent impressions should be made upon the inner Nervous coats of the Heart and Arteries, as to put these Vessels upon driving the Blood about so rapidly: And therefore it is very likely that the Heart and Vessels themselves impelled the Blood, the Blood it self not concurring thereto. We may likewise infer that from the vehemence of some passions of the mind, joy, anger, &c. the Channels of the Blood do of themselves promote its motion, because the lucid and sense-causing Spirits, being moved more than usual, do rush more vehemently out of the Brain into the Nervous Channels, those perhaps especially that send branches into the Heart and the Vessels that spring from that Bowel, whereby it comes to pass that the constrictions of the heart become more frequent and vehement. In such a case as this it were rashness and imprudence to fly to Venesection, and to order it as often as we would do in inflammatory diseases.

XIII. Because the Blood that is poured out at the Nose, appears florid and saturated with a splendid redness, it is commonly believed to be more pure and sincere than the rest: The reason given is, because it is poured forth by very slender Vessels, which ('tis said) admit not the thicker Blood. But the whole Mass of Blood, together with all the humours it consists of, is percolated, at least in the Liver, as all agree (which the Physicians that defend the old Hypothesis ought to have noted, who likewise teach that the thicker Blood is evacuated by the Hemorrhoids, and issues out of the Capillary Vessels.) If they say that those small Vessels are widened by the turbulent and more vehemently fermenting Blood, why say they not the same of the Vessels of the Nostrils? Besides, that Blood which flows out of the Hemorrhoids, is sometimes no less bright and red than that which runs out of the Nose: Therefore neither the saturate redness of the Blood, nor the finalness of the Vessels out of which it issues, evince that that Blood is purer than the rest.

rest. We shall easily find a reason of its deep redness, if we observe what happens to the Blood as to its colour, as it flows out in this or that manner, out of these or those Vessels. The Blood that flows out of an Artery being cut, is (*ceteris paribus*) more bright and red than that which flows out of a Vein: Likewise the Blood, from whencesoever it flow, that destils out by drops, is redder than that which issues forth in a full stream by a large Orifice. Blood let forth into a broad Basin looks very red: If the same be received out of the same Vein into a narrow and deep Vessel, it inclines more to black. Lastly, If the Blood that is let out of its Vessels be received in a cold place, it becomes more ruddy, if in an hot one, more black. Thus the Blood that flows out of the internal Hemorrhoids, if it be retained in the streight Gut, looks more black; but more red if it issue forth presently, unless some special cause hinder. From these things it is evidently gathered, that the Blood when it is suddenly cooled, becomes more red; when it cools by degrees or leisurely, it is more black: Now it cools the sooner when it issues out but in a small quantity, because a little is less able to resist the ambient air than much is: It is sooner cooled when it is received in a large or wide Vessel, than when in a narrow and deep. From these the rest appear. Therefore the reason why the Blood that flows out of the Nose looks more red, is not because it is purer, but because it is suddenly cooled. What the quickness or slowness of cooling can do towards variety of colours, we may observe in Steel when it is temper'd; for if a bar of Steel that is red hot be moved very swiftly through the cold Air, it puts on a reddish colour; if not so swiftly, a colour that inclines to yellow; if yet less swiftly, it looks blue; if very slowly, it receives the natural colour of Steel: For like as Bodies that are very hot are cooled quicker or slower, are the insensible particles of which they consist disposed on this or that manner, and they diversly modifie the light which they reflect, in which modification does their colour consist. Not only the quickness of cooling makes the Blood of a more saturate colour, but also the motion of the particles of the Air, which by licking as it were the surface of the Blood, and depressing the particles that jet out, make it more smooth, dense and slick, and so makes its redness more bright, through the greater reflexion of the light. Thus Red wood looks redder when it is smoothed and polished by some convenient instrument. From the same cause the Blood that was blackish in the top of the Vessel, if it be exposed to the Air, acquires a more saturate and splendid colour, namely because its dispersed and eminent particles are depressed and compressed into a dense skin, which reflects more light than the same Blood, when its particles were loose and less cohering, because then a great deal of the light did penetrate into the interstices of the parts, and was not reflected at all, and the rest falling upon soft parts was reflected but weakly.

Fr. Bayle
probl. med.
2.

XIV. From the precedent problem it is easily understood that a sudden mutation from heat to cold, and the appulse of the Air, are the cause of the redness where the Blood that is poured forth shineth: Hence it follows, that as often as the Blood is red, it has undergone the greater and more sudden change; which happens two ways, either because the Blood is hotter, or because the ambient Air is colder: Wherefore in an equal temper of the ambient Air, other things being also alike, a notable redness of the Blood is a sign of its notable heat: therefore a florid redness of the Blood is not a certain token of malignity. Yet if horrible Symptoms accompany a Fever, such as none but

a notable putrefaction can produce, and yet a putrefaction of the Blood cannot be deduced from its colour, those grievous Symptoms are to be referred to some malignity.

Idem.

XV. To prove that the Elements of the Blood are the four vulgar humours, to wit Blood so called *in specie*, Choler, Melancholy and Phlegm, some take an argument from the variety of colours in the different parts of the Blood when it is cold in a Poringer: for they affirm that that which is florid in the uppermost part, is choler, which because it is fiery, gets a top through its lightness; that which is next under this is Blood, which being hot and moist, hath an analogy with the Air; below this is Melancholy; which being of an Earthy nature, descends to the lowest place by its weight: Phlegm, which resembles the nature of water, they say is mixed with Melancholy, as Water is easily mixed with Earth. Besides they say that the said humours do yet more betray themselves by their colour, especially Blood and Melancholy: The manifest token of the former is a splendid redness, and of the latter a blackish colour. Indeed those who think thus, do notably accommodate these *phenomena* to their Hypotheses: But from what has been said it is evident that the uppermost part of the Blood is red because it is very quickly cooled, and is more immediately affected by the pulse of the Air, and that the lowest is blackish, because it is cooled by degrees, and the Air acts only remotely upon it. Wherefore it depends on the pleasure of the Surgeon, whether all the Blood that is poured forth of any Vein shall look intensely red or no; for so it will look, if it be received in a wide Basin; but blackish, if in a narrow and deep Vessel, or if it be set to coagulate in a warm place: Thus Blood may be accounted almost all of it Melancholy, or all of it Blood *in specie* so called, as it cools on this or that manner. Therefore it is a weak argument that is taken from the colour of the different parts of the Blood cooled in a Vessel, to prove that its elements are the four vulgar humours.

Idem.
See below
§. 21.

XVI. Nor may we always from the colour being changed infer that the substance is changed or corrupted; for we see many Bodies change colour without any sensible detriment to their chief faculties, seeing they put forth the same actions as before, and with the same strength. But in Heterogeneous Liquors there can hardly be induced a colour much different from what they use to have, but they must undergo a great change, especially if they be of the kind of those that are very easily alter'd, through the mutual action of the parts that constitute them, whether those parts be determin'd to act upon their fellows by external agents, or be stirred up to divorce by the mixture of extraneous Bodies, by which ways both Blood and Milk are very easily changed, suffering on this side divers Secretions, and on that, Concretions of their constituent parts: Hither does that retire that is thin and more fluid, and there does that coagulate which is more thick: All which things can hardly happen but there must be some change in colour, and hardly can Blood undergo such a change but these things preceded. Wherefore one would think that the colour of the Blood might shew whether and how great its putrefaction is. Moreover a livid or black colour both in the Blood and in the Flesh signifies that there is a putrefaction a growing, or already grown therein, as we may observe in a Gangrene and Mortification: And though Pus or Matter be the offspring of the Blood or Flesh putrefying in a certain manner; yet they are not changed into Pus till they have past into a sublivid *Sanies*. Putrefaction consists in the dissolution of the parts from one another, so as that they fall asunder, or be

be very ready so to do: Putrefaction, I mean, properly so called, which is in the Bodies of Animals. Such dissolution of the parts is necessarily accompanied with blackness, the parts being dissipated that reflect the light more strongly and plentifully, or being however become sorer. Therefore when the Blood looks black, not only in the bottom of the Vessel for the reasons given in the preceding Paragraphs, but also in the very surface, where through its proper constitution from the sudden cooling and appulse of the Air it ought to be red, 'tis a certain sign that there is some putrefaction in it. If the Blood be not only black, but also do not coagulate, it signifies that the putrefaction is diffused through the whole Mass, the Fibres being corrupted by which the Blood should curdle. If the Blood look red in its surface in one place, and in another incline to livid; if here it look palish, and there yellowish, &c. it is a sign there is a great disposition to putrefaction: For that variety of colours cannot happen unless many and Foreign and diverse things be mixed with the Mass of Blood, which whilst they act upon one another, corrupt the Mass of Blood. There are innumerable things to be inquired concerning the colour and consistence of the Blood, the knowledge whereof is greatly necessary for the knowing of diseases and Morbifick causes.

Idem pro-
bl. 6.

XVII. When in Venesection the Blood that runs forth is received into Water, that part that gives redness to the whole Mass, is separated from the rest and mixt with the Water, and the remainder, or a great part of it, for the most part grows together into whitish Fibres. Some think that what is Phlegmatick in the Blood, or Phlegm itself passes into such Fibres. It cannot be denied but Phlegm is always mixed with the Blood, seeing even in the healthful something of Phlegm does continually descend from the Brain upon the Fauces, and from thence into the Stomach: But I can hardly be brought to believe that the Filaments that grow together in the Water are mere Phlegm, but I should rather think that it is that part of the Blood which was ready to pass into the substance of the solid parts; for both of these are white. And it is an argument hereof, that such as have more and more firm Flesh, and a more robust Body, in the same is the Fibrous part of the Blood the more plentiful: And in the lean, whose Blood is more acrimonious, or corrupted, there are fewer of those Fibres. Therefore from those whitish Fibres it cannot be inferred that the Blood is Phlegmatick, but that it has a greater or lesser consistence, accordingly as these Fibres abound more or less. Besides from the colour of the Fibres it may be inferred whether the Blood incline to a Choleric, Phlegmatick or Melancholic constitution. Thus heretofore Hippocrates knew by the rags of a menstruous Woman, having first wiped away the red part of the Blood, whether the Blood were bilious, &c.

Idem pro-
bl. 7.

XVIII. I do not think that snivel which (sometimes) swims a top of the Red Blood, is always excrementitious Phlegm, but rather the crude part of the Blood elaborated from the chyle, but not as yet concocted enough, nor brought to that perfection it ought to have, but wants to be perfected by the repeated circulation of the Blood. Aristotle himself calls that *Mucago* or Snivel, the crude and unconcocted part of the Blood. Harvey (*lib. de generat. animal. p. 319.*) says that that part is found in the more hot and robust Animals, as Horses, Oxen, and Men also of a vivid constitution, and swims a top like Hartshorn gelly or the white of an Egg somewhat thickned: And he does not reckon it to be the cruder and colder part of the Blood, but the more Spiritual, seeing it swims above the florid and rutilant part in the

coagulated Blood, and abounds chiefly in persons of an hot temperature, the robust and well-set, and comes forth with a greater violence in Venesection. I have sometimes seen this gelly lie under the ruddy part. But by a diligent inspection for many Years of the Blood that has been let, I have only observed that this *Mucago* is not found in those that use a spare diet, and are of a good temperature, but frequently in the gluttonous and such whose Bowels are indured with a weaker heat: whence it is almost always observed in the Phlegmatick and Old. I never saw it flow out of the Veins of the Head, often out of those of the Arm, but most often out of the Veins of the Feet and in a larger quantity. It is sometimes also found in persons of the best constitution; and the reason is, because these from the vehemence of their appetite eat heartily, and sometimes more than Nature can presently turn into good aliment, whence part thereof remaineth more crude, but yet by a frequent circulation of it through the heart, especially if a more spare diet follow withal, it is at length turn'd into good Blood, that so we may be sure this gelly is the parts of the chyle not as yet sufficiently concocted in the work-house of the Heart.

§ Blood that is wholly destitute of fatness, or wants it in part, is not very commendable: A plenty thereof makes the Body fleshy; its unctuousness, fat; and its leanness, lean. This opinion of mine may be confirmed by examining the Blood that is let forth by venesection: For the upper part thereof that many take for the Phlegm of the Blood, and so is esteemed for a faulty part, is often the best Blood. This may be known by the Fire; for if it be Fat, it will flame; but if Phlegm, then it uses to crackle.

XIX. In Bleeding in a Pleurific when the Blood is cold, it looks like melted Suet for a considerable thickness, and its surface is like true Pus or Matter; and yet it is far different from it, seeing it is straitly woven with Fibres like the rest of the Blood, and runs not about like Pus: But when this discoloured part is pulled from the rest, it looks like a tough and Fibrous skin; and perhaps is nothing else but the Fibres of the Blood, which being deprived of their Red and Natural cover by precipitation, are grown together into such a whitish membrane by the coldness of the Ambient Air. But (to touch this by the by) we must note, that if the Blood issue not forth of the Vein in a straight stream horizontally, but creeping along the skin fall Perpendicularly, let it run this latter way never so fast, yet often it will not be of the said colour: Of which I confess I know not the reason. Nor is the Patient so much relieved by such Bleeding, as when it flows forth in the manner first described. Yea though it flows out this very way, if a too narrow Orifice, or any thing else hinder it from running forth in a full stream, neither in this case will the Blood look like that of the Pleuritical, nor will the Patient be so much benefited by it. Moreover I have observed, that let the Blood flow out how it will, if one stir it with his Finger as soon as it is received into the Poring, its surface will look as Red and florid as in any other disease.

XX. The Blood that is taken forth by Venesection looks often very dry and destitute of all Serum after some hours, which is commonly imputed to too great heat or adustion: But this reason is very feeble; for if on the same day you open the same Vein again, or another, you will find Serum enough in the Blood that comes forth. So that the true cause is to be sought in the circulation of the Blood, but especially in the Lymphatick Vessels, which at that time attract the Serum and moisture, and make the Blood drier.

XXI. When the Blood is cold in the Porringer, then that which is in the bottom looks far blacker than that which is in the upper surface. Indeed it is a common opinion that that black Blood is Melancholick Blood, and men are wont to use this as an instance to shew that the Melancholick humour (as 'tis called) together with the other three enter the composition of the Blood. But *Fracastorius* affirms that that black colour proceeds from hence, viz. Because that Blood which is in the bottom of the Porringer is not exposed to the Air, and not from any mixture of Melancholy with the Blood: Which that he may demonstrate, he says the colour it self will change and become clear and red, if it be exposed to the Air.

Reg. Soc.
Angl. p.
153. Ann.
1667.

XXII. Seeing *Revulsion* helps Fluxion by way of *Vacuum*, it follows that every evacuation does not do it, but only that which is large, so that thereby there be made an inanition either of the whole, or of the parts that lie next to the part affected. Which I say for their sakes that think to avert a Fluxion by extracting two or three ounces of Blood: and believe that they shall do this more effectually, if they let forth that little quantity not all at once but at several times, stopping it ever and anon: for seeing a *Vacuum* happens not by such evacuations, by means whereof the Fluxion to the part affected is hindered, how shall they cause a *Revulsion*?

Martian.
6. Epid. 5.
v. 17.

XXIII. In *Revulsion* we must mind in what quantity Blood is to be let; whether together and at once, or by repeated turns? Though Authors commend this latter way, yet reason and experience teach that a certain distinction is to be used. For first we let Blood at one turn out of the larger Veins in an Afflux of the humours without effusion or evacuation: but at several turns out of the lesser Veins in an Afflux with effusion, as in an overflowing of the Terms, or too great an Hemorrhage. Secondly, We let Blood all at once when the Matter is already flow'd into the part, and remains in it: but by little and little while it is but a flowing into it. The Quinsie, Pleurisie, &c. afford an example.

Frid.
Hofm m.
m. l. 1. c.
20.

XXIV. We gather from *Hippocrates* (l. de nat. hum. v. 230.) the difference between the curing of a disease present, and the preservation from one imminent: We must endeavour to make our Sections as far as may be from the parts affected, &c. Because in the former case Venesection is to be made out of the Veins that are nearest to the part affected. Whence *Galen* (6. aph. 36.) has noted that our great Master used always to let Blood out of the Arms for diseases above the Liver; but for those below, out of the Legs and Ankles; a reason whereof is given by *Celsus*, l. 2. c. 9. Nor am I ignorant (says he) that some say, that Blood is to be let at the greatest distance from the part affected, for so the course of the matter is averted, and that which already oppresses the part is called forth. But this is false; for Bleeding first exhausts the nearest part; and the Blood therefore follows from the remoter parts, because it is first let forth of the nearest; but as soon as it is stop'd, it comes no longer from afar, because it is drawn. *Hippocrates* has confirmed that same precept, lib. de loc. Sect. 2. v. 285. where speaking of all evacuation he says; But diseases are to be drawn forth by that part which they are nearest to, or by the nearest outlet. Which at length he hath more particularly expressed even in the evacuation that is made by Medicines: Pains above the Midriff that need purgation, intimate that they should be purged by Vomit; but those below by Stool. But for prevention of those diseases that have been used to invade often, *Hippocrates's* opinion is, that Blood should be let at the greatest distance from the part affected: Of which he gives a double reason; namely, 1. Left there be a great change made on the suddain in that part which is used to be ill:

For by such change the humours being for the most part moved, and the part it self further weakened, fluxions towards it are excited, whence the accustomed Diseases are raised. Which Precept many Gouty Persons not observing, whilst they will Bleed or Purge for prevention, they often raise those pains that were quiet. 2. Another reason is, that by Venesection made in distant parts the custom may be removed, by which the humours used upon any occasion to flow upon the part accustomed to be affected. By which it is clear that the *Revulsion* which is made from the remotest parts is not good in the Cure of present Diseases, unless one would stop Symptomatical evacuations; for then *Revulsion* is to be made, according to the advice of *Hippocrates* 6. Epid. 2. 50. We must reveal, if the humours run whither they should not. ¶ The several kinds of *Revulsion* profit and gratify diversly: For to Reveal to the Origin is usual in those Diseases which rise from some peculiar Member: *Traction to distant parts* is good for those which are fed by the whole Body: But *Tractions to contrary Parts* are profitable for both; Namely, to a part that is Contrary to that from which, and to which the matter flows: And moreover it has this use peculiar to it self, that it is most beneficial for prevention, Nature, as I said, being called off to that part which is contrary to that to which she is inclined. Nor matters it that the same Veins are to be opened both in prevention and Cure; seeing this *Revulsion* is owing to the motion and custom of the humours, rather than to the Disease and Humour.

Bleeding.

XXV. Some make the Kidneys the Centre of the Body, as to its length; but this is better referred to the Heart. It is better to Bleed on the same side with the part affected; the Reason is in the Arteries, not in the Veins.

Walaus
p. 81.

XXVI. If the Blood be observed not to Circulate as it should do, by the Pulse's not being full enough, but little, and from anhelous Respiration, I think bleeding altogether necessary: And these two indications that are taken from the Pulse and Respiration, I would recommend to the diligent observation of every one, seeing they are of great Consideration in many Diseases as to Bleeding. I say, a little and an oppressed Pulse, yet soft, as also a laborious and anhelous respiration, are the chief signs and indications of the Blood's stagnating about the Ventricles of the Heart, and threatening danger of suffocation.

Sylv. de le-
Boe prax.

XXVII. *Hippocrates's* Precept (Aph. 22. 1.) of purging in a turgency of matter, is not observed in ordinary practice; but when there appears an Orgasm of the humours, we rather fly to bleeding as more safe, and so we the more easily prevent the moved humours from rushing into some Noble part, which if they were more exagitated by a Purge might be the more readily precipitated into it. ¶ We may gather from *Galen*, that bleeding may be allowed in a turgency of the humours. Which that it may be understood, I premise these things: 1. That the turgent humours are not always Choleric, but sometimes Sanguineous, Blood here being taken for a fervent humour, resembling Choler. And such Blood is Turgent, because it is moved very quickly and easily; so that I believe acute Diseases arise from it, as they do also from pure Choler: Whence many dangers threaten, because it may very easily run into the Principal Parts. 2. I premise that in a Turgency of the humours there may also concur sometimes other Reasons for Bleeding, as some fault in the Sanguineous matter, the greatness of the Disease, the Strength of the faculties and a Youthful Age. 3. But if purging be compared with Bleeding in a Turgency of the humours; the former doubtless is more to the purpose and more profitable, but the latter is safer. And because according to *Hippocrates* (1. Epid.) a Physician ought to endeavour so to profit as that he may do no harm withal, therefore Bleeding may be sometimes used

pract. l. 17.
c. 1.

O o o o o in

in the room of Purging. If you object, That Purging draws only bad humours, but Bleeding all; so that one cannot be substituted for the other: I Answer 1. that Turgent humours that are different from the nature of Blood, are also evacuated by Bleeding, as being in motion. 2. That Bleeding is not always substituted, but only sometimes. If you object again, That where Bilious humours are turgent and such as differ from Blood, the Blood it self does not offend, and therefore it is not proper to substitute Bleeding: I Answer, That in such a turgency of humours Bleeding is not to be substituted indiscriminately, but only where there is a most vehement Fever, which rather requires a friendly Venesection, than offensive Purgers, which are hot and apt to induce a Fever. Now that a violent Fever requires rather Bleeding than Purging is not doubted. Whence I draw these conclusions: 1. If the humours be mixed with the Blood, without doubt Bleeding is proper, as appears by the faultiness of the Blood that is let forth. 2. If the turgent humours be different from the nature of Blood, but there be present an high Fever, strength of the faculties, a youthful Age, I approve of Bleeding; and so much the rather, because in such case there is always some fault in the Blood also. 3. If humours differing from Blood be turgent, and prohibitors of purgation be wanting, as also indications for Bleeding, then by no means must we breathe a Vein, but only insist upon Purging, as that which will afford no small relief, and do much more good than harm.

Claudin.
Respon. 2.

XXVIII. Though Revulsion be commonly used in the very Paroxysm, yet it is also profitable after it, that the morbid relieves may be quite taken away, so that a new fit may not come. Thus in a suffocation of the Womb proceeding from the retention of Blood, as also in other diseases, fit help is given by Bleeding, as well in the Paroxysm when necessity urgeth, and there is danger of extinguishing the natural heat through the abundance of Blood, as out of it, as whereby the superfluous Blood that is preternaturally retained is evacuated, translated from the Womb another way, and the imminent suffocation of the Spirits and heat removed.

Gr. Horst.
probl. dec.
9. 9. 3.

XXIX. When critical evacuations appear, viz. *Exanthemata* or Spots, *Parotides*, *Bubo's*, &c. whether may we Bleed? We must first shew what *Exanthemata* and Abscesses are, and from whence they arise. *Exanthemata* are little Prominences in the skin, or red, pale, purple, or blackish spots, sometimes all over the skin, sometimes scattered here and there, one while thicker, and another thinner, sometimes broader, sometimes more united, and sometimes not raised at all above the surface of the skin. That is called an Abscess, which from a defluxion of matter transmitted into any part of the Body, either inheres in it, or raises a tumour, as the *Parotides* under the Ears, and *Bubo's* in the Arm-pits and Groins, or Carbuncles, and other such like, under which name Abscesses and *Exanthemata* are comprehended: For there are also critical evacuations by Stool, Vomit, Bladder, Womb, &c. but these use to be called Abscesses by emission, and the former by deposition, from which we will take no indication of either letting or not letting Blood, but from the Diseases and Symptoms that follow them. The matter of *Exanthemata*, and *Bubo's*, Carbuncles, and the like Abscesses, is Blood, that is unprofitable to the Body either through its quantity, or faultiness, or on both accounts, which Nature by way of Crisis endeavours to thrust out of the Body at some certain time, which thing she sometimes performs without any help, but sometimes being oppressed she is overcome,

needing the help of art. Therefore Venesection will be unprofitable while *Exanthemata* and other the said Abscesses are breaking forth, or a little after, whilst the Fever, and other bad accidents (if there be any) seem to be remedied or evidently to be mitigated; for that signifies that the strength of Nature is above the morbid cause: Wherefore the Artist ought in such case to see that he do not imprudently weaken or disturb the endeavours of Nature that are well begun. But if the said endeavours be either wholly unprofitable, or less effectual, then it is a sign that Nature is oppressed by her burthen and overcome by the cause of the disease; and unless she be helped, she often lies vanquished in so dangerous a combat. Therefore as she was not to be interrupted while she shew'd her self a Conqueror; so neither is she to be left destitute of help, when she yields the Physician any signification of her weakness and oppression: Which is the opinion of Hippocrates and Galen, 1. aph. 20. *What diseases are judged, and are judged intirely, &c.* Also 2. aph. 12. *These which are left, &c.* If any say, It often happens that imperfect crises are prolonged for several days, so that it seems nothing is to be moved either on the day the *Exanthemata* break forth, nor also on the day following? I Answer, That no certain stated and universal rule can be given in these cases; but it is the part of a prudent Physician to discern when Nature is to be helped on the first day, or on the second, or later; or when she is to be left without help; seeing she wants no help, if buckling to the work on the day of the crisis she either remedy or greatly lessen the disease; but otherwise if she do not. Add that Bleeding may also be profitable, when by the eruption of these the maladies are somewhat mitigated. So that I do not put off Bleeding (though otherwise Blood were let before their eruption) if I see the Fever to decline but slowly: For even these are sooner cured thus, as the other (if they do recover) both sooner and more safely. Let us therefore say with Hippocrates and Galen, that Judicatories (or Crises) which do not terminate the disease, are signs of a predominant and perverse humour that stimulates Nature to an overforward excretion. Therefore Nature shews that she desires help, and that by Bleeding rather than Purging. For the reason is at hand, and that a very strong one, seeing in the cases proposed the cause of the disease is in the Veins, not in the Intestins. Add hereto, that Purging, besides that it disturbs all the Body, recalls both the impetus and motion of the humours to the principal or internal parts. Hence Hippocrates says, 4. *Acut. Syctrophæ* (a sort of Abscess) cannot be dissolved by Purging; for in these Venesection is to be preferred, &c. Wherefore Purging is only allowable by art either in the beginning of a Fever, or when the humours being concocted are prepared for excretion: But Blood (if the Nature of the disease require it, and the faculties gain say not) may be let at any time. Nor is this conceit of ours of evacuating the Body in the *Parotides*, or in *Exanthemata* that relieve not the Patient, new, or not confirmed by Galen in his explication of these words of Hippocrates, 6. aph. 9. *Broad Exanthemata itch not very much.* You will object again, that by Venesection, that is called inwards which Nature had begun to expell outwards, viz. from the circumference to the centre? I Answer, That that only happens in superfluous effusions of Blood, and not in such as are made artificially. And by this reason which is brought, Venesection is not so strongly disproved in this place as purging, which they are not against, but sometimes inopportune propose it. But suppose something be pulled back, which yet there is not, the profit in the mean time that follows upon

upon a convenient evacuation of the burthening Matter, is greater than the injury that could happen from a little corrupt matter received into the *Vena cava*. But let us confirm the matter by examples: A putrid and notable *Synochus* (or continual Fever) invaded a strong young man; on the third day he had a Looseness like a *Diarrhœa*; the next day the Fever and Looseness continuing in the same vigour, red *Exanthemata* very thick and somewhat raised above the skin appear all over the skin: the following day, which was the fifth from the invasion of the Fever, seeing all the mischiefs to continue vigorous, I advised to take eighteen ounces of Blood from him; whereupon they all began so to decline, that two days after there remained no foot-step of them. From another Youth that was sick of the same disease, but without a Looseness, I ordered a pound of Blood to be taken: When I order'd it, it was the fourth day of his sickness, but the second after the eruption of the *Exanthemata*; and on the fifth day from the beginning of the disease he returned again to his usual occupation.

But in curing *Exanthemata* that arise without a Fever, or which precede it, such as were observed in many in the Summer of the Year 1575, both in Women and Youths, and grown Men, namely very thick Prominences all the Body over, that were broad, hard, reddish or pale, such as those caused by the stinging of Nettles, sometimes with itching, sometimes without, seeing there is no Physician almost but presently flies to the proposed remedy: there is therefore nothing remaining to speak of these, save that it is an error to Purge before Bleeding, seeing the said disease for the most part happens from the effervescence and redundancy of the Blood; and in case of costiveness, Clysters are to be used.

What I have said of *Exanthemata* breaking forth with a defective Crisis, take the same things as spoken of *Parotides*, *Bubô's* and other *Abscesses* of the like sort breaking out before the due time; namely, that it is best to let Blood in such case, viz. When the Fever neither grows less nor increases upon their breaking forth, for this I have found to be very profitable in many, &c.

XXX. Phlebotomy uses often to amend the mixture and temperature of the Blood, but in a manifold or several respect. For 1. If any Heterogeneous thing be confounded with its Mass, namely, which can neither be rightly subdued, nor easily separated and thrown off; the Blood that flows out upon opening a Vein does often carry forth so much of that Matter with it, that the remainder may either be conquered or expelled. 2. The Blood departing from its temperature, is often restored by Venesection: for when its Mass hath degenerated from a fixt Sulphur or Salt, or from both of them exalted together, into an Acrimonious, Salt or Salino-Sulphureous, by letting forth a portion of the Blood there presently arises a new fermentation of it, and often there is caused such a change of all the particles thereof, that thereupon the Spirits do a little emerge with the Volatil Salt and recover their dominion, the fixed Sulphur and Salt being subjugated (as they ought to be.) For this reason it is, that Bleeding often brings great help not only in Fevers, but moreover in the Scurvy, Jaundise, yea in the beginning of a Phthisis or Consumption: for the Blood, after the Vessels are emptied, like the Stomach unloaded, does better concoct or assimilate all the humours received into it, and what is Heterogeneous it the easier separates and dischargeth. But if the Crasis or mixture of the Blood begin to be much loosed and spoiled, as in the Plague and Malignant Fevers, abstain wholly from Venesection, because by letting of Blood, the store of Spirits is diminished (which alone can free the

Mass of Blood from putrefaction and corruption) and so all things tend presently to a destructive dissolution. Moreover if the Dyscrasie of the Blood be such, that the more noble principles, to wit, the Spirit, volatil Salt and Sulphur being depressed or wasted, the watry and earthy particles are predominant, the Blood ought by no means to be let out, but to be preserved as the treasure of life: Because when the Spirits are but few, every loss of them causes all the faculties to stagger, and strengthens the disease, as in a Dropsie, Cachexy, Consumption; and in other diseases, where the active principles are greatly depressed, to open a Vein is almost the same thing as to cut a mans Throat. In the aforesaid cases, where the Crasis of the Blood is respected, it will be easie to determine whether Bleeding be convenient or no; but in some others, as especially in a continual putrid Fever, when life and death turn upon this hinge, there needs the greatest deliberation. We must consider the state of the Blood, the tendency of the morbidick Matter, and the strength of Nature. 1. If in a putrid Fever the Blood situating very much, shall raise a great heat with thirst, watching, and drought in the Throat, and there appear no eruption of plentiful Sweat, or of *Exanthemata*, nor is shortly expected, Venesection is so plainly indicated that it is not lawful to omit it: But on the contrary if in a languishing Body there arise a Fever that is slow and remiss, yet continual, with a weak pulse, abstain from Bleeding, and get the Fever off by Sweating, Urine and Blistering. In a middle state of the Blood and of the Fever, Bleeding is indifferent of it self, and it is to be determined by other respects. Therefore 2. We must consider the tendency of the morbidick Matter, or its impetus, which if it be sluggish in the morbidick Matter and unfit for Secretion, and so (as it often uses) making a translation into the Head, instead of a Crisis, threaten the Brain and Nerves, Bleeding is seasonably made use of for preventing these mischiefs. But if this matter being suddenly excited into a violent motion, and either rushing inwards into the Viscera of the lower belly, cause cruel Vomiting or dysenterical distempers, or else being driven outwards seem about to produce the small Pox, Measles or other breakings forth, every such Impetus of Nature, if good, ought not to be disturbed, if bad, not aggravated by Bleeding: For in these cases to let Blood is not only dangerous, but oftentimes ignominious. 3. As to Bleeding in a doubtful case, we must moreover have regard to the strength of the Patient: For in a sound constitution, Youthful age, the beginning of a disease, and when the faculties both vital and animal are as yet in a brisk and indifferent condition, Bleeding ought to be confidently prescribed, unless something contra-indicate: But when it shall be otherwise as to these conditions, proceed not rashly to this evacuation.

XXXI. Avicenn denieth that Blood is to be let in the beginning of diseases, because thereby the noxious humours are then extenuated, and impelled through all the Body, and are so mixed with the pure Blood, that nothing of the offending humour is brought forth with the wholesome juice. lib. 1. fen. 4. c. 20. Likewise, lib. 3. tr. 2. c. 7. in the cure of the Foot-gout and *Sciatica* he would not have us to let Blood in the beginning, Because Phlebotomy, says he, stirs up the humours, and makes them run into the Body, and does not extract that which is necessary to be extracted. So lib. 4. tr. 2. cap. 42. in the cure of a burning Fever he dissuades the same on the same account: yea even in a Sanguineous Fever he would have us to Bleed moderately in the beginning, but plentifully after maturation or concoction. He is refuted by *Fernelius*, l. 2. meth. c. 13. 1. Because the greatness of the disease, which sprang from the exuberance

Willis
posib. e.
per. sect. 3.
c. 1.

Leon Bo-
tallus lib.
de curac.
per f. m.
cap. 5.

of the Blood alone, requires Bleeding presently at the beginning. 2. Add hereto that the strength is intire in the beginning; which, an indication of the disease being given, persuades to Bleed presently in the beginning. 3. Because it is manifest also by experience, seeing a *Febris synocha* is cured presently in the beginning by a large Bleeding. 4. Yea seeing concoction is rather owing to a *Cacochymy*, it will follow that the indication for Bleeding does tarry for no concoction of the contained Matter that is to be taken away by Venesection: Wherefore, after a perfect concoction of the humours, there will rather be place for Purging than Bleeding, which *Fernelius* demonstrates at large. To *Avicenna's* reasons it is thus Answer'd. To the *First*, By denying that Bleeding does extenuate the humours, because there remains the same proportion of them in the Veins before and after Bleeding. To the *Second*, By denying that Venesection stirs up the humours, seeing it uses not so much to exagitate, as to stop the organ of the humours. For a conclusion let it be noted, that as we judge *Fernelius's* assertion to be very contemporaneous to truth; so we determine that *Avicenna's* opinion is not to be taken absolutely, but *secundum quid*, as he distinguishes betwixt a disease *in fieri* and *in facto*, with respect to particular diseases: And he denies that when the disease is *in facto*, or already formed, Bleeding is convenient in the beginning, because the matter that causes the Gout is no longer in the Veins. And the reason why concocted matter permits Bleeding, is because Nature being now more at liberty, and no longer busied in correcting any particular malady, has her faculties strong, and willingly admits of Bleeding for the prevention of a new Fluxion. Thus Venesection is forbidden in the beginning of a Burning-Fever, in regard the Fever indicates something else: And thus he commends moderate Bleeding in the beginning of a Sanguineous Fever: Perhaps that the faculty that languishes through the oppression, may be leisurely comforted, and so afterwards may better sustain a plentiful Bleeding, when there shall be a maturation of the Fever, that is, when there shall be a freer ventilation of the Febrile heat.

XXXII. A redundancy of Blood is chiefly taken away by Bleeding: But it is questioned whether its abundance may not be taken away also by other means? *Walaus* says, That we may waste it by fasting. For seeing our Natural heat is never idle, but always requires something to act upon; thence it comes to pass that in defect of aliment it sets upon the Blood it self and wastes it: Wherefore fasting may be safely used to consume a Plethora. And *Erasistratus* seems to have been of that opinion, if we may believe *Galen*. But we say 1. That a Plethora is lessened indeed by Fasting, but by degrees, not of a sudden, as many acute diseases require. 2. By fasting we use a certain violence to Nature; for fasting is fruitful of divers Symptoms and diseases, and is able to kill in the space of a few days: Whilst in it the vigour of a well disposed digestive ferment having no object to act upon, doth waste and consume the proper aliment of the Stomach, whereby not only in a sound body the good and profitable humours are wasted, the body dried and consumed; but also in a *Cacochemical* and impure Body the corrupt humours are moved and agitated withal, and Nature swerving sends part of them, for want of good aliment, to the Stomach, which is not a little disturbed thereby, and by consent therewith the Brain and Heart are afflicted, so that one Symptom comes to be heaped upon another.

Frider.
Hofm. m.
m. lib. 1.
cap. 13.

XXXIII. In judging of diseases much is attributed to the pulse; which being weak and small, for the most part death is threatned; but if on the contrary big and full, there is hopes of reco-

very. Yet I have seen one that was corpulent and a great drinker; whose pulse, while he lay languishing in bed, was so little and small, that being hardly to be perceived by the Physician one would have been apt to think death at hand, unless his rubicund Face, his Eyes, Teeth and full Veins had gaind: Wherefore inquiring more diligently into the cause of so great a malady, I believed it to be caused by too great saturity and abundance of Blood, and that no fitter remedy could be used than a speedy Bleeding. But his relations and friends were against it, for fear such a remedy might make the Man die the sooner: But at my instance, and assurance that he would certainly recover if it should be done, at length they consented. Wherefore presently calling a Surgeon he was let Blood, and forthwith both his pulse and strength returned, so that his recovery was quicker than his death, which seemed to be at the door, was believed to have ensued.

Beneven.
abdit. c. 69.

XXXIV. Whether is Blood to be let sometimes when the Spirits languish? I think the difficulty is to be determin'd by a distinction. For the humours either abound, or are moderate: The latter case does by no means admit of Bleeding; But when the humours abound, though they may neither distend the Vessels nor burst them, nor overwhelm the natural heat; yet because they oppress the feeble strength, so much of them may be diminished by Bleeding, as that Nature may easily govern the remainder, so that no humour may putrefie or be corrupted. But though Authors determine thus, yet it is later to extract that which exceeds (unless the disease be very violent) by abstinence and a spare diet. ¶ We must presently abstain from Bleeding because the faculties seem in some sort weak: For the faculties may do so two manner of ways; one, while they suffer nothing as yet in their proper essence; another, when their essence suffers, which it does by oppression or dissolution, &c. The faculties are said to be strong, or weak, absolutely, or *secundum quid*, accordingly as both the carnos and spirituous substance, wherein they inhere, is duly constituted, or something is deficient.

Mercat. l.
1. de pra-
sid. c. 2.

These things being premised, we may conclude that weakness of the faculties or strength hinders not Venesection, as they are weak *secundum quid*, as is proved in a constitution that is very lean, yet with no small abundance of Blood, wherein the strength languisheth in respect of the carnos substance: An instance whereof we have in *Galen* of a Woman that was cured, 6. *Epid.* 3. 29. So likewise the oppressed faculties, when they suffer nothing in their own Nature, are very much helped by Bleeding: On which account *Hippocr.* 4. de vict. acut. and *Galen* *ibid.* think that if an healthful person lose his speech all of a sudden from the intercepting and shutting up of the Veins, he ought to be let Blood forthwith.

Horat. Au-
gen. l. 4. de
curat. per f.
m. cap. 2. &
lib. 3. cap.
14.

XXXV. Whether is Bleeding profitable in a Flux of the Belly? *Hippocrates* says 4. *Acut.* n. 116. If you would Bleed any one with profit, his Belly must first be strengthened. In which place *Galen* says, You shall not take away Blood in a flux of the Belly: For if the flux continue after the Bleeding, it dejects the strength. And this opinion he confirms *Art. Curat.* ad *Glauc.* 14. If a Fever happen with a Looseness, there is no need of other evacuation, but that is sufficient of it self, though it be not in respect to the Plethora: And whosoever shall venture either to Bleed or Purge such, as if they needed greater evacuation, precipitate their Patients into more grievous mischiefs. But who will deny that the Guts are of the same nature with the Stomach to which they are continued? And if this, as *Galen* teacheth 7. *m. m.* be subject to all sorts of intemperies, what incongruity is it that the Guts should be subject to the same?

Greg.
Horst. qu.
6.

same? Every part of the Body is afflicted sometimes with an hot, sometimes a cold, moist or dry *Intemperies*, or one compounded manifoldly of these, and shall the Guts remain untouched and unviolated by them? If so, it follows that the Symptoms of every disease attend upon their disease: But amongst the Symptoms of all diseases the commonest is the fault of the function or faculty. Now there is a manifold function of the Intestines, as of other parts, to wit, of attracting, retaining, concocting, expelling; all which are necessarily hurt by what *intemperies* soever the Guts are afflicted with, and that more or less according to the distemper they are affected with, sometimes one function more and another less; and therefore if it happen that the retentive faculty is injured by an hot intemperature (which happens oftener than by a cold) what hinders why we should not remedy this affection by Bleeding, as we would do the same from a like cause in any other part of the Body? Do the Guts want Vessels by which they should be subjected to a defluxion of humours? Do they not also suffer inflammations and Gangrenes from an afflux of humours? Are they not sometimes full of hot and vellicating Ulcers? Are they not afflicted with bitter pains when they are exercised with a Dysentery? As to *Galen's* argument, it ought not to be put in the controversy, that by the continuance of the Flux the strength wasts, and that by so much the more if Blood were let forth superfluously, or Purging were used; but is the decay of strength owing only to Bleeding or Purging in case of a Loosness? Is not the same thing caused by a Fever? Or does not any notable pain the same? You will say, not so easily; seeing the strength is not so quickly exhausted by these wherein there is observed no notable evacuation, as by a flux of the Belly. But what can you say in fluxes of Blood out of the Nose, Womb, Hemorrhoids, Lungs, Stomach, &c. In the cure whereof Blood is advised to be let by skilful and vulgar Physicians? You will reply, that only revulsive Bleeding is granted in those cases, and only a little quantity is taken, to the end namely, that a passage being made in an opposite part for the Blood that is in motion, it may cease to flow thither whither it was a going. For the very same reason I also say, that Blood is to be let out of the Arm in a flux of the Belly raised from an hot intemperature which has always an efflux of humour attending it, that an exit being provided for it in another part, and part of it drawn forth, the remainder may cease to run and burthen the part which it had begun to possess: And so the humour being partly lessened, and partly called back to another part, the *intemperies* that was the cause of the flux must in all likelihood become less: And this being lessened, it is necessary that that should also decline with it which was affected by the same cause, viz. the superfluous dejection of the Belly.

Let us confirm our assertion by Examples. A bilious Bloody dysentery (with excoriation) with a Fever and a very great provocation to Stool, had so, for a whole month almost, afflicted *Polemarchus Brixianus*, that there was little hope of his life; yet he was so relieved by taking six ounces of Blood out of the left Arm, that it proved a present remedy, seeing on that very day all the harms begun to decline evidently, and he was in a short while restored to perfect health. 2. In the same kind of disease, with a swelling of the Spleen, ten ounces of Blood being taken did wonderfully help, and recover the Wife of N. 3. Gripping and a Fever grievously tormented Mr. N. for three days, on the fourth being Bled to ten ounces the distempers so slackned, that the next day they went off quite. 4. N. was grievously and dangerously ill of a Fever and a dysentery

with excoriation, by which being almost killed, when another Physician had Purged him several times with Rhubarb, on the twentieth day I let him Blood to ten ounces with manifest relief: two days after I Purged him with Senna and Syrup of Roses solutive, which Medicin took away the remainder of the malady. 5. Mr. N's. Cook was first taken with a very fore Fever, and the next day with a notable Dysentery: I presently order'd him to be Bled in the right Arm to about fifteen ounces, after which he was more at ease, and the day following both distempers went off. 6. Bleeding proved also a wonderful help to Mr. N. who was brought to extream leanness by a long and strong Fever with a flux of his Belly that was sometimes Lienterical, sometimes Dysenterical, sometimes of another sort, and sometimes mixt: He had been frequently Purged with Rhubarb, had taken Diureticks, had used Astringent fomentations, Anointings, &c. I proposed Bleeding: His Physician wondring at the novelty of the remedy, presently alledged his Flux, loathing of meat, weakness, extream leanness, a tabid Fever, and the little hopes there was of a recovery: Yet upon my advice a Vein was opened in his right Arm, and about nine ounces of very putrid Blood taken away. After six days, because he was notably bettered by the first Bleeding, we opened a Vein in the other Arm, and after ten days more Bled him a third time. Thus after a few days he was quite cured. 7. A Fever and a Loosness, as well by their continuance as vehemence, had left N's. Servant nothing but Skin and Bone in the Siege of *Rechel*: I recovered him by letting him Blood three times, eight ounces at a time, and Purging him with Senna and Syrup of Roses solutive. 8. A very troublesome flux came upon a putrid *Synocha*, sometimes in the form of a *Diarrhoea*, and sometimes of a Dysentery: upon the tenth day the Fever not abating, both distempers were taken away by Bleeding twice on the eleventh day. But seeming to grow worse again upon repeated Purging, letting that alone I betook my self to Bleeding only, which I used twice again: Upon the first Bleeding he was a great deal better, but upon the second quite well. 9. A considerable Lientery had afflicted Mr. N's. Servant for eight days, from which he was very manifestly relieved by Bleeding of him, and the next day quite cured by a decoction of Senna with a little of the infusion of Rhubarb. 10. A Man of seventy years of Age being troubled with a *Diarrhoea*, for eight days, and being afraid of Bleeding because of his Age, I prescribed him an infusion of Rhubarb, which doing him no good, he was at length recovered by Bleeding. Now as I reckon Bleeding the principal cause of the recovery of all these and very many others, that by God's blessing I have recovered of various and grievous fluxes of the Belly, as well new as old, as well with a Fever as without it: So on the contrary I think the death of many ought to be refer'd to the want of the said remedy, &c.

¶ *Galen* (6. *Epid. sect. 3. comm. 29.*) cured a Woman that was very much wasted and had lost her appetite, and had long labour'd under a suppression of her Terms, by very large and repeated Bleeding. Imitating *Hippocrates* who 5. *Epid. num. 2.* cured a Consumptive person of an extream leanness, that could not be helped by any sort of Medicin, by Bleeding him in both Arms even till he was become Bloodless: These were followed by *Benevenius* (l. de *abdit. cap. 44.*) and *Epiphanius Ferdinandus* (hist. 69.) The former restored a Woman to her former health, that having her Terms suppress'd for a year was become nothing but skin and bone, by repeated Bleeding. The latter recovered another from a Catarrh complicated with an Hectick Fever, also by the help of Bleeding.

In

Leon. Bor-
tal. lib. de
curat. per
f. m. cap. 5.

In these, seeing the wasting and leanness were owing to a vitious Blood, that was black, Melancholick, and unfit for nutrition, that Blood was to be taken away, that fresh and such as would nourish might supply its place: For the parts do not attract to them naughty Blood, but refuse it; just as people that are an hungry refuse meat offered them that is ungrateful to the taste, even though it be put to their Mouths: The parts likewise are delighted only with semblable and familiar aliment. *Avicen* indeed 4. 1. cap. 20. does greatly forbid Phlebotomy in bodies that are very lean; but he is to be understood of such a leanness as arises from defect, to wit, from a want of Blood and Spirits: For such an one is cured by addition, not subtraction. On that account in Hectick and other marcid and tabick Fevers, Venesection is to be rejected, because such wasting and witheredness supposes want. Also a natural leanness and slenderness, which is the offspring of an hot and dry intemperature, the chief sign whereof is absence of fat, refuses Venesection, because in such the faculties are not strong: For the predominancy of heat, the looseness of the Pores, and the thinness of the Blood and Spirits make them apt to be enfeebled and grow faint upon Bleeding. Of these *Galen* speaks, 9. meth. 15. Those that are naturally lean, and of an hot and dry temperature, are greatly offended by evacuations.

XXXVI. Bleeding is prohibited by urgent Symptoms, as Pain, want of Sleep, and immoderate excretion; for these deject the strength. Likewise every immoderate Symptomatical evacuation, that dejects the strength, as also Critical (by the Nose, Womb) or Pleuritical forbid it. Those have little skill to do good, who seeing a drop or two of Blood drop from the Nose in burning Fevers, hoping for a Trophæe, cry out, That here is occasion for Phlebotomy: If the Hemorrhage be large, they do it more boldly, affirming Nature to be burthened. But hereby the Critical Motion of Nature is hindered. Others seeing bloody Spittle in a Pleurisie, urge bleeding; but the same is forbid by the Oracle, 6. Epid. 3. 44. A Pleurisie hinders bleeding in spitting of Blood, which is profitable in other kinds of spitting of Blood. An Hemorrhage of the Womb in a Pleurisie is esteemed by some as an indication for bleeding, by others an hindrance. *Cleomenes's* Wife being sick of a Pleurisie had her Terms flow plentifully on the fourth Day, by which she was so much relieved, that all her Pain, Cough, and difficulty of Breathing ceased upon it. Others distinguish: If the time for the flowing of the Terms be at hand, Venesection is permitted; if shortly expected, and the Disease be urgent, Blood is to be let first in the Feet, and then in the Arms.

meth. gen.

lib. 4. sect.

2. cap. 8.

idem ibid.

XXXVII. Pain forbids Bleeding, because it weakens. Yet if a great Inflammation be joined with the Pain, it is rather commanded, according to *Galen*, 1. Aph. 23. Otherwise it is hurtful, as in a Cardialgia or gnawing Pain at the Stomach that dejects the faculties, 1. ad Glau. Cap. 14. In the Pain of the Kidneys, and Colick, from Wind, Bleeding is good, not *per se* or properly, but by accident, that the matter in the Veins being lessened, the Kidneys and Colon may not be so easily inflamed and pressed with a Phlegmon. Add hereto, that by opening a Vein the flux of other parts is sometimes lessened, through the communion that these have with the whole Body, and because of the thinness of the Spirits, which may be carried through all the narrow passages. Wherefore *Hippocrates*, 2. Epid. 5. feared not to flie to bleeding in a pain raised from *Flatus*; for, says he, Venesection cures Flatusities. Yet in this Disease, as also in a great Nephritick pain, I know many Physicians that

have practis'd Physick a long time, who having been much against bleeding their Patients tormented with pain, when their Patients have been bled at their own desire, have plainly seen how far they were from the right. Botal. c. 9.

XXXVIII. By Venesection there seems to be a retiring of the Blood from the circumference to the centre, 1. Because to avoid a vacuum the fluxile humours do necessarily tend towards the Centre to fill up the place of the evacuated Blood. 2. Hence the external parts look pale and cold after Venesection. 3. Often the Inflammation of some Internal part is increased. 4. *Galen* (4. de tu. San. Cap. 10. & 11.) intimates this, where he advises that the Body should not be replenished presently after Venesection, lest the Veins snatch crude juices to themselves. 5. *Avicen* does therefore not open a Vein in those who are bit by a Serpent, before the Poison be dispersed, lest it tend inwards: On the same account he forbids bleeding after the small Pox are come out. Thus he determines that the same does stop a looseness, because it first draws from the lesser Veins to the Cava, from which consequently the Blood is let out by Venesection. On the contrary, nothing is of more constant Practice, than when the humours, especially the Bloody, flow to the internal parts, to make a revulsion to the external by opening a Vein, 1. In asmuch as the Veins that are emptied draw from those which are fuller, and the fuller afford their help, and being loaded with plenty do readily deposite their burthen into the empty Veins, the fluidness of the humours not a little assisting. 2. In an inflammation of the Liver, Lungs, or Pleura, *Hippocrates* and *Galen* bid us open a Vein in the Arm, to revel from the internal parts, to the external. 3. And therefore (1. de vult. acur.) that in a Pleurisie Blood is to be let so long till by its colour we can discover that to come which was flown to the part affected. 4. How should there often be a strong revulsion, if there were always a fresh afflux from the circumference? 5. Why does *Galen* (4. de tu. San. C. 3.) dissuade bleeding to those in whom crude and vitious humours possess the internal parts? For a further clearing of the matter, *Sylvat. (contr. 37.)* notes, that in letting of Blood it is to be supposed that there is in the Veins a plenty of Blood, either convenient, or not. If there be a greater plenty than is agreeable to Nature, when Blood is withdrawn by Venesection, there ensues not a vacuum; but the Veins subside, as we see to happen in a Leather Bottle or Bladder when part of the Liquor is poured out. Hence it is concluded, that in Venesection the Blood is compelled to retire to the centre, if the Veins that are in that place be deprived of their Natural quantity of Blood, either in whole or in part; but it will return back again to the circumference, either because it flows from the Bulk of the Body out of the neighbouring Spaces into the Veins; or because the Veins that are next to it are emptied, some part of that which is contained in the Veins succeeding that which is evacuated. To the Arguments 'tis answered; to the first, The consequent is denied, because when the Blood is diminished, the Veins coincide of their own accord. To the second, There is not always a paleness, but when there is, it happens through too large evacuation, fear, recourse of the Spirits to the Heart, &c. To the third, An internal Phlegmon is sometimes increased, not by reason of the Blood that is let, but through a new afflux, which would afflict more grievously if a revulsion were neglected. To the fourth, 'Tis granted, because the abounding cacochymy in the first ways is first to be taken away, that vitious Blood may not be generated afresh. To the fifth, *Avicen's* Reasons rather prove the contrary: For because Poison is inimicus to Nature, therefore at first

first we must take diligent heed that the Motion of Nature to expel the Poision be not hindered by Venesection. But when it is dispersed in the Body, it is lessened by even a plentiful bleeding; Namely, if there be an indicant for Bleeding, that so part of the Vitious Blood being taken away, that which remains may be the sooner dissolved. Thus also the expulsion of the small Pox is not to be hindered by another Motion of the Blood, which Venesection may do; as it is likewise granted in a Flux of the Belly.

Horst.
Inst. med.
disput. 18.
7. 7.

XXXIX. Those Physicians err, who following Galen open a Vein in any Flux of the Belly in an opposite or most remote part, for revulsion: For I will affirm, that when Blood flows immoderately and Symptomatically, to bleed further is besides Hippocrates's intention, who for revulsion of the Blood flowing immoderately to the Womb, bids us affix Cupping-glasses to each Breast, but forbids taking any Blood away (2. de mor. mul. vers. 36.) And if by such evacuation the sick be observed not to be notably hurt, because we take away but a little Blood, yet I think they reap little or no profit thereby. For what good do we think can the letting forth two or three Ounces of Blood do, for revelling the Blood that is rushing into any part? Which evacuation hardly makes a motion in the Blood. Therefore because the strength will not bear so large a Bleeding as might possibly make a revulsion, and a small does no good; therefore Hippocrates thought it better to abstain from Bleeding, and to flee to other remedies. You will object, that lib. de steril. vers. 422. he bids a Woman to be Bled who doth not conceive, when the mouth of her Womb gapes, and by consequence her Terms flow more plentifully? I Answer, That is another case, for the Terms flow not so plentifully, as that it can be called a flux; nor is there that weakness as will not admit a moderate Venesection; which he commands not for the sake of the menstrual flux, but for the cure of Barrenness. You will object again, that 1. de humor. and 1. de morb. he opens a Vein in them that spit Blood. I Answer, His intention is not to make a Revulsion of the Blood that is flowing, but to take away the Plenitude which may hinder the closing of the broken Vessel, and to avert the imminent inflammation of the Ulcer: For he opens a Vein in spitting of Blood no less when some Vein being pulled asunder pours forth a little and blackish Blood, than when the Blood flows hastily and plentifully out of a bursten Vessel. He plainly shews his meaning by adding, And let him use a diet that may make him very dry and Bloodless. Which words make it apparent that he opens not a Vein for Revulsions sake, to hinder the course of the flowing Blood.

XL. Whether can Bleeding be helpful to the too cold of constitution? Galen 1. de rigor. &c. says, In a disease which requires heating, none have dared to bleed. And 5. meth. c. 6. But if there be none of these things, but it be winter, or the climate be naturally cold, and the person also himself be of a colder constitution, by Bleeding in such a case the whole Body is both greatly cooled, and there happen some Symptoms that lead to a dangerous Refrigeration. If the coldness of the climate or season hinder Bleeding, much more does a cold intemperies; seeing the Blood does not only afford nourishment to the Body, but the natural heat also is sustained and continued by it. Yet 8. meth. 4. he bids us bleed hastily in an Ephemera from obstruction of the skin, which the external cold often causes. Reason persuades the same, because obstruction hinders transpiration, from this ariseth a redundancy of the multitude of the humours, from which proceed obstruction and putrefaction. But we must thus distinguish the matter: If the distemper we would cure be cold, as if, for example,

any labour under a cold intemperies, he must use hot things only, and abstain from Bleeding which is a cooling remedy. But if the disease be hot, and Refrigeration be only as an antecedent cause, while we extinguish the Fever by Bleeding we shall do no harm: for the procatactick cause has no indication belonging to it. Yet when refrigeration hurteth even the Viscera, Bleeding is most Vallet. of all to be shunn'd. ¶ Those things which are contr. 1. 7. alleged against Bleeding, are only to be under- c. 6. stood of that which is made for evacuations sake; and make us take heed that by letting Blood there follow not a crudity of cold humours; and intimate that the quantity is to be moderated. Add hereto that the Authors of approved medicin have often practis'd Venesection in diseases meerly cold; as in a Dropick, from the retention of some usual evacuation, Hippocr. 4. acut. 11. For when the heat is suffocated by Blood that is too cold through its plenty, Bleeding is a present remedy. Likewise in palpitation, a cold disease, lib. de rigore, &c. c. 5. In a Priapism, 14. meth. c. 7. In a suffocation by cold Water, Dioscor. 1. 6. c. 4. Paul. lib. 5. cap. 66. Zacut. princ. med. hist. 8. l. 2. In stubborn diseases proceeding from a cold cause, to abstain altogether or more than is meet from Bleeding, is not the part of a prudent Physician; seeing 'tis certain that every part of the Body is nourished by that matter which is in the Veins: Which the colder and thicker it is, by so much the more grievous and stubborn does it make the distemper that is raised from the like matter: Which matter we say is to be diminished partly by Bleeding, de f. m. partly by Purging and an attenuating diet; that cap. 12. the Mass of Blood being cleansed and renewed, the disease may be cured.

XLI. Others proceed further who in all Fevers let forth the harmless Blood, excepting neither the spotted Fever, nor the Plague, nor Poision: Thus freeing themselves of much labour and trouble, which otherwise the many sorts of Fevers would create them. But because the nature of poison and malignant humours chiefly consists in this, that they forthwith set upon the heart, and quickly deject the strength of the most robust; and seeing Bleeding does both likewise, not only diminish the strength, but also draw the malignity to the Heart, and impells that back again to the oppression of Nature which she had driven forth for her own easement; I cannot but pray and admonish all Artists, that they will not proceed to Venesection either in the Plague, or other malignant Fevers, or also in all those accidents whereby men are Poison'd inwardly or outwardly, especially if they love and seriously aim at tranquillity of mind, and the health of the Patient that desires their help. The French, Italian, Spaniards, and Portuguese, those fierce contenders for Venesection will reply to me, that Nature by Venesection draws Air as it were, and is unloaded in some manner, that she may so much the more easily cast forth the remaining malignity: And this seems true, for the Blood draws the Air, that its Spirits may the more readily fly away, and it may be eased of those faculties that it necessarily wants. When these things are finished, the Patient changes life for death, and very well knows how to draw tears from the Eyes of the by-standers. Giving no other reasons they do moreover rely upon their experience; but I wish they relied well upon it, for I have found such Patients, who in the morning were in no danger, after Bleeding five or six ounces taken away in the evening by cold and rigid death. Hence therefore we may rightly gather what it is they name Experience, namely, If the Patient by chance escape, the honour is given to Venesection; but if he die, as he does commonly, there was malignity in the case. Therefore I oppose experience

L. Botal.
de f. m.
cap. 12.

experience to experience, thanking God greatly that he hath exhibited and demonstrated a far certain and better remedy to all those, who rightly consider diseases without envy, passion or being enslaved to another's opinion. Others that they might seem more moderate in this matter, admit of Venesection in the beginning of the disease, before the malignity manifest itself externally; and herein I will readily assent to them, if it be done, 1. In hot Countries. 2. In a full Body. 3. When the humours ascending to the head cause grievous accidents there. In such a case I think Bleeding in the Arm or Foot will do a great deal of good. But those who will prescribe Venesection in all Bodies, and without difference in these cold and moist Countries, such shall certainly find no good success thereof. Yea they can hardly give a reason which will be received by art as genuine; especially seeing themselves do freely and ingenuously confess, that they sometimes meet with such cases wherein they dare not order Bleeding which they cry up so much, performing the cure to their desire by Sudoriferous and cooling potions.

Barbette
Chirurg.
part. 1.
cap. XI.

XLII. Avicen. Fen. 4. l. 1. c. 29. Bleeding often causes a Fever, and many times putrefaction. Venesection through the ebullition of the Spirits causes diurnal Fevers, and if it be too large, by debilitating Nature causes putrefaction, the innate heat being weakened: it generates an Heetick, if it be done in Bodies wanting Blood, the lean, hot, dry. A weakly man being in no disease caused himself to be Bled in the midst of Summer; being lean and weak he begun to be Feverish thereupon, and complaining of an inflammation in his Liver, the Physician not considering his weakness, nor thinking upon Coolers and Purgers that were then necessary, Bleeds him more than once: Whereupon the Blood (wherein heat has its perseverance) being evacuated, his flesh wasted, and he died of a tabid Fever.

Zacut.
prax. ad-
mir. lib. 3.
obs. 53.

XLIII. When there is occasion for repeated Bleeding, whether ought the second to be larger than the first? Galen l. 4. de sanit. tuend. seems to make the second larger: But l. de venæ sectione he bids us add half the quantity the second time. Which many understand so, as that only half as much is to be let forth as was before; but I think he means as much, and half as much more: Namely if six ounces were taken the first time, then nine are to be taken the second: Though there is a contrary place, lib. de venæ sectione c. 17. where Galen took three pound the first time, and after an hour one pound: But there, as I suppose, the case was so urgent as to compel him to take more the first time. Yet the matter is thus to be weighed, namely, That where nothing hinders, and necessity is not very urgent, it is better to begin with a small quantity, especially when we have not experienced the strength of the Patient: But when we have and find it consenting, when necessity urges, we must take more the first time, notwithstanding Galen's saying who bids us add half the second time.

Mercat. de
presid. lib.
1. cap. 2.

XLIV. I suspect whether change of the colour should be respected in Bleeding; for at what time the Blood is a flowing, 'tis hard to observe such a change of colour; and when it is already run out, it is not so profitable to look upon it; seeing often when one has been let Blood twice or thrice, that which is hid in the deepest *minera* of the putrefaction, is drawn out in the last place, yet in but a small quantity, so that it can do little good, and the Patient cannot without harm sustain further Bleeding though never so necessary. So that I think that measure of the quantity to be surer, which is chiefly taken from the benefiting and sustaining: And though there do not presently appear any benefit, yet the

sustaining has this excellency, that if the remedy be used according to art, it promises benefit, and endures repetition till the disease be overcome. Mercat. de
Pres. l. 1.
c. 2.
Physicians use to receive the Blood into three Porringers; when they observe a discolouring in the last, and see it very impure, and dare not continue the Bleeding till it come forth pure for fear of fainting away, they declare that the Patient must Bleed again, not once, but three or four times: And they are confirm'd in this opinion when they see a glutinous surface in the Porringer, that is clammy and tough: But this measure is deceitful, for that is esteemed for discoloured Blood, which is Blood mixt with chyle; the glutinous surface is chylous.

Rolfinc.
meth. gen.
l. 4. sect. 2.
c. 10.

XLV. One would at first think that the measure of the quantity of Bleeding should be, till we have taken away all abundance; but we may not do so: for there is one thing which I think I have observed, viz. That there has been an excess made, when so much Blood has been let forth, that the left ventricle of the Heart could no longer drive it into the Body, nor the Blood come from thence to the right ventricle of the Heart.

Walrus
meth. med.
p. 78.

XLVI. There are some cases wherein it is expedient to cause fainting away by evacuation: For in very great inflammations, in the most burning Fevers and most vehement pains, the Ancients, as Galen reports, used to make evacuation to that degree: Nor indeed as if Lipothymy were to be the measure of the greatest evacuation, as the common opinion is; for this measure would have been very deceitful, seeing some faint away upon the least occasion, and others endure immoderate evacuations without swooning: But rather because in the aforesaid cases Lipothymy comes on a proper account; for hereby is a retraction made of the Blood and Spirits to the viscera, whence there is caused the greatest revulsion from the part affected: the habit of the Body likewise is very much cooled, and a torpor is induced upon the senses. I have observed this benefit in pains, so that I cannot sufficiently set forth how notably it takes them away. A noble Woman being troubled with very violent pains in her Head, and all things that were given her doing her no good, the pain at length came to that height, that through the greatness of it she fell into a swoon, out of which being got in a little time, she was freed from all sense of pain, and continued in that state till the same pain returning caused a new swooning, which proved the cure of the pain. Hence I perceived the reason why the Ancients in the greatest pains made evacuations to fainting away: For Hippocrates also in the Pleurisie (4. acut. v. 241.) hath commended it, If the pain reach to the Clavicle or Collar-bone, &c. and it be acute, we must Bleed even to swooning; Not exclusively, as some interpret, but inclusively, for he says, If the pain be acute, we must Bleed even to swooning: Hence it appears that swooning is procured because of the violence of the pain, that it may take the pain away. Seeing therefore swooning, even without immoderate evacuation, happens in all cases in which it is approved of; it will not be necessary to administer an evacuation in that manner, lest the Patient before a great evacuation be made, faint away, as Galen observed. Yea he is sometimes to be placed so as that even by a moderate evacuation he may fall into a swoon, namely when 'tis feared that the sick either through age or some other great cause cannot bear a large one; and that we shall obtain if he be Bled either standing or sitting.

XLVII. As I never make those numerous Bleedings which proceed to fifteen or twenty: So this I will premise, that there is hardly any disease whose cure I do not begin with Venesection, because if that be not used in the first place, there

is scarce place for any remedy; For a full Body neither makes the ways permeable for other evacuations, nor affords it a passage for any medicines; what is cooled is condensed, what is heated is inflamed; such a Body is fit for no way of cure: Therefore it is so far to be evacuated, as that it may sustain the remainder of the cure without prejudice, but not so far as that the faculty may not suffice afterwards, or the Body incur the before rehearsed prejudices.

Vallef. m.
m. l. 4. c. 2.

XLVIII. The habit of the Body affords but a deceitful token of the measure of Bleeding; wherefore we must be the more attentive to the strength of the faculties, and to the Veins themselves, from which the strength of the faculties is more manifest than from the habit it self of the Body. This indeed *Celsus* has taught us to examine; for if the Veins be large, and the habit also fat and loaded, such Bodies bear Bleeding more easily: But if the Veins be small, though the Bodies be slender, yet they bear this kind of evacuation more difficultly.

Mercat. de
Jud. med.
l. 1. c. 4.

XLIX. 'Tis certain that Bleeding is profitable against a *Plethora*, whether already compleat, or but a beginning; for the mischiefs of a *Plethora* cannot be better taken away or prevented by any other remedy. Yet we should avoid the necessity of this evacuation as much as we may, namely because the Blood becomes thereby more sulphureous and less salt, and therefore almost all persons are apt thereupon to fall into Fevers, and to grow fat. Moreover Venesection being a great remedy, if it be prostituted to every little occasion, it will become less effectual when there is need to use it for great diseases. To which this may be added, that, according to the observation of the vulgar, the more familiarly any one uses Phlebotomy, the oftner he shall need it; because Blood being often let to avoid a *Plethora*, the rest of the Mass will the sooner arise again to a *Plethora*, far otherwise than some think, who fear lest the store of the Blood should be wasted by Venesection, seeing on the contrary by this means its quantity becomes larger, though its crasis be worse: For thus the Blood being spoiled of its balsamick salt, and of its salt that preserves it from putrefaction, is instead thereof saturated with a fatning and more pyretick Sulphur.

Willif.
posth. oper.
sect. 3. c. 1.

L. An error of no small moment is committed within moderate bounds, whilst in some cases Blood is let with too sparing, and in others with too liberal an hand. In a burning Fever, Pleurisie, Inflammation of the Lungs, Apoplexy and other great diseases, arising from a turgescence or phlegmonous incursion of Blood, to Bleed too sparingly does always more hurt than good: For besides that it takes not away the antecedent cause of the disease, viz. the *Plethora*, it does moreover cause the conjunct cause, viz. the inflammation or irruption of the Blood, to be increased. For it is a constant observation, that by letting Blood too sparingly, its whole mass does forthwith effervesce more notably, and has new rushings into the part affected. The reason whereof is, that in a great *Plethora* many portions of both the Blood and Serum being thrust into recesses and straits are compelled to reside there, which after the Vessels are a little emptied, regurgitate impetuously into the mass of Blood, and do very much exagitate it and drive it very violently hither and thither: Wherefore even in this regard 'tis necessary the Vessels should be very much emptied, namely, that besides the freeing of the Blood from the straits there may be space granted to the humour returning from banishment, which otherwise being not so congruous to the Blood causes a tumult, and raises it into effervescences and eruptions. Hence we may note that almost all men presently grow hotter after Bleeding, who yet if

there were a sufficient evacuation of the Blood, are more temperate afterwards.

Willif.

LI. *Galen* (*de cur. rat. per f. m. c. 13.*) determines that Old Age does not forbid Venesection: You shall open a Vein in men of Seventy, says he, if the disease require it, if there be the aforesaid Pulses: For there are some even of this Age that have much Blood and are brisk; as there are others dry, and of little Blood, and that are apt to wither and shrivel upon opening a Vein in any part. Wherefore you shall not only have regard to the number of years, which some do, but also to the habit of the Body: For there are some that cannot indure Bleeding at Sixty, whereas there are others that can bear it at Seventy; however you shall take less from these, though they seem to have the same affection as a young flourishing Body. Thus far *Galen*. If therefore a brisk Old Man be afflicted with a Pleurisie, Peripneumony, a burning Fever or the like diseases, there is no doubt but he may and ought to be let Blood, seeing without that remedy such diseases can hardly ever be cured: And if they are not able to indure the remedies, they must necessarily perish, and so all diseases should be mortal in Old Men. I have seen a Man of Seventy three years of Age let Blood four times in three days, and there were at least thirty ounces of Blood taken from him. *Rhases* also let a decrepit Man Blood that was afflicted with a grievous Pleurisie. ¶ That elegant passage of *Celsus* (*de erat.*) is to be produced here: "The Ancients thought infancy and Old Age could not bear this kind of remedy; but it matters not what the Age is, but what the strength is: Therefore if a young Man be weak, 'tis bad to let him Blood; for the strength that remained decays and is snatched away hereby: But a lusty Boy, and a hearty brisk Old Man do safely admit of Bleeding: But an unskilful Physician may be very much deceived in these things, because commonly those Ages have but little strength. ¶ I knew a Woman that had so accustomed her self to Bleeding, that she was glad to be let Blood yearly in the Spring, or else she could not be well: And she kept this custom to the Eightieth year of her Age, bearing it very well; but such are very rarely to be found."

Primirof.

Trincavel.
l. 2. c. 10.
Praef.

LII. Nor is this kind of remedy to be feared in tender Age, if the disease be great; for I have Bled a Boy of Ten years old, very ill of a Pleurisie, in the *Salvatella* of the same side, who by the next day at even was freed from his distemper and perfectly recovered. The like remedy I have used in other Children in the Quinsy, induced thereunto both by reason and experience, having sometimes seen Children of four or five Years of Age Bleed a pound of Blood through a wound by a stone, knife, or some other instrument; and particularly one that Bled a great deal through an Artery cut in the Temporal Muscle, whom yet I cured, as I have done several others, without any detriment to the waxing faculty; yea I know some of them alive still that are strong, fat and fleshy: So that in diseases where there is danger of life, and an indication for Bleeding present, we should not be afraid of this remedy. ¶ But the boldness of a young Surgeon of Paris exceeds all belief: When I practis'd Physick at *Neuenburgh* in *Switzerland*, but upon occasion was out of the City, a fat little Boy, of a very good constitution, seven weeks old, but whom any one would have thought to be a year old, was taken with a cruel Pleurisie: The signs whereof were, a violent Cough, an acute Fever, and when he was laid down in his Cradle or born in ones Arms, if he were touched never so lightly on his right side, after having coughed a little he would cry very vehemently, with difficulty of breathing:

Marchett.
observat.
36.

I say a rash, but successful Surgeon applies two Leeches to the Bending of the right Arm, and therewith took away about two ounces of Blood, which remedy was of that efficacy that the Child was quite cured the same day of his very dangerous distemper. But though Bleeding have proved well once or twice through the strength of the Patients, yet it ought not to be drawn into Example: Colder Climates do not admit it at all, nor does it always succeed well in the hotter, as saith *Victor Trincavella de cur. affect. l. 2. c. 20.* who relates how at *Venice* and *Padua* some Physicians opened a Vein in tender Infants, but that always a bad success attended. Wherefore prudence is greatly necessary here, if in any case.

LIII. Idiosyncrasie or the singular property of each one's nature make some to endure any Bleeding well, and others neither such as is large, nor indifferent; yea some are afraid and discouraged by the very mentioning of it, especially such as otherwise are apt to swoon. *Galen l. aph. 23.* makes mention of these. Some have been observed when there was the greatest necessity of Bleeding, upon the thinking of the operation, to tremble in their Limbs, not to know what they did; being bid to stretch forth their Arm, they have drawn it in; and on the contrary, being bid to turn away their Eyes, they have done otherwise; so that those who stood by were forced to put a Cap or Hat before their Face, and the matter has hardly been done without their fainting away: This is connatural to the *Dukes de Biron in France*: The Duke de Biron Marechal of France, lying ill of a burning Fever, yielding at last to be Bled with much persuasion, swooned away, though a person used to War, and very famous for Royal victories. A noble *Hamphobus* (or dreader of Bleeding) consented to be Bled, which was terrible to him by an Hereditary succession of his Family: His Blood scarce saw the light, but a swooning coming on deceived the hopes of his Physicians that it would do him no harm.

nar. l. 4.
sect. 2. c. 4.

LIV. He that would determine the quantity of Blood that is to be let, is bound to consider the Country, or the sign of the strength, and plenitude of the Body. In hot Countries that are near to the Meridian, large Bleeding is not so well born as in middle climates. The French, especially in *Paris*, bleed very largely: *Riolanus (l. de circul. c. 26.)* defends this prodigality. In diseases from a Plethora, and continual acute, putrid burning Fevers, he determines that we ought not to spare, but that half of the Blood in the Body may be let forth in fifteen days time. *Scamotus* says he, without pitying the sick, and detesting the Physician, read in *Platerus's* observations, Histories of Patients that have been scorched with burning Fevers without Venesection. And he thinks that those who have escaped in such case, have recovered health, not by the help of their Physician, but by means of their Fate. In the small Pox, Measles, spotted Fevers, they think that Bleeding does not retard, hinder or avert the excretion: In other grievous diseases and full of danger, as the Apoplexy, Phrensie, Pleurisie, Joint-Gout, Foot-Gout, &c. they are hardly in Heroick Venesections. Colder Countries that are nearer the North seem not to bear such large evacuations of the Blood so well, whether the Fevers be acute continual, or intermitting. Experience has taught, that when by the advice of French Physicians the excellent Duke de Longueville, the French General, and *Panner* the Swedish General encamping in the middle of Summer ann. 1640, by the City of *Salsfeld* in *Duringen* (a Country in upper Saxony) when these illustrious persons I say were Bled largely, it did not answer desire. Though plentiful Bleedings may be confirmed in our Coasts

by the portentous instances of spontaneous Hemorrhages; one being noted by *Rulandus* that Bled ten pound in a days time; and another by *T. Durnus (miscel. med. c. 11.)* who being but ten years old, in a double Tertian Bled fifteen pound within the space of one Month, and yet both of them recovered. But it is safer not to rely on these Examples, but to use a mediocrity. It is not from the purpose to add what *Zacutus* (in his Book of observations) delivers concerning the Blood of the Spaniards and Germans, being very worthy our knowledge and notice: That in the Bodies of the Spaniards there abounds a thick, succulent and compact Blood, so that if they be taken with a continual Fever, and not Bled freely, they all die: On the contrary the Bodies of the Germans are full of a crude watry Blood, that is not very firm. If the Blood that is taken from a Spaniard in a Fever be fluid, and watry, and do not coagulate, it is a certain token, known even by the most ignorant, that such a one will die, because the fibres of the Blood are corrupted and dissolved: But in Germany, not only in malignant diseases, but also in those that are more slight and less dangerous, a fluid and watry Blood is void of all danger. From whence it comes to pass that the Germans cannot so well endure Bleeding, especially if more large, because their Blood is less spirituous, seeing experience is witness that if a Vein be opened in a state of health, only for prevention, often even while the Blood is yet a running, they fall into great Lipothymies, and the same is much more to be feared in continual Fevers. The nature of the Italians differs not much from the constitution of the Spaniards; but the complexion of the French is fiery, whence they have need of greater ventilation by Venesection.

Rolfinc.
meth. gen.
l. 4. sect. 2.
c. 11.

LV. Letting of Blood may breed a custom: Thus the Ethiopians, who use often to scarifie their forehead, their forehead itches when Blood is redundant: As likewise do the shoulder-blade and arm in those who have been used to be scarified or Bled in those parts. For the emptied part draws from the whole, and nature endeavours to unburthen her self by that part which uses to be opened.

LVI. Whether is letting of Blood to be omitted in the state and vigour of a disease? In diseases whose motions are sudden and swift, and which are of a more rugged and fierce nature, we must speedily make use of the most effectual remedies, wherefore a larger bleeding is convenient in these even at the first time. A moderate one is also profitable in the beginning of other diseases, for which it may seem good at other seasons of them, as in a Tertian Ague. Nor is it only good in the beginning, but in the increase of diseases; but not indiscriminately in all diseases, nor at all times; for there is no need of it in every slight inflammation, or pain, or every small disease that would terminate in health, if left to itself. Nor is it reasonable to believe, that if it be good to open a Vein in the beginning for a pain in the side, throat or eyes, that it is so also to do it in the first invasion of the chilliness of a Tertian Ague, &c. or other disease that gives truce; but it will be soon enough if it be done after the first, second, or even third fit. Therefore it was rightly said of *Galen (l. de curat. pers. m. c. 23.)* That the number of days is not to be attended, as some have writ; yea on what day soever you shall find in the Patient indications for Bleeding, use that remedy thereon, though it be even the twentieth day from the beginning. And *G. m. m. c. 5.* he says likewise, That Blood may be let at any time, but the sooner the better. That it is profitable in the augment as none doubts, so does scarce any admit it to be good in the state and vigour; but this is contrary to the last opinion of

A. Thoner.
obs. 33. lib.
1.

Galen,

Galen, and against reason, seeing it is very often found most profitable at that time, especially in those diseases in which is observed so great strength, that their end is held to be doubtful. As for my self, I am not only not afraid to let Blood in the Vehemence of a disease, when *exanthemata* have broken or are a breaking forth; but neither am I so in burning Fevers or *Synochæ*, in which there appear neither *Exanthemata*, nor *Parotides*, nor droppings of Blood at the Nose, nor any thing else besides the greatness of the Fever. Yet I know that *Celsus* does very evidently detest it, and also deny that it ought to be done after the first or second day. Which last as it is true, when it is fitly referred to those diseases of which *Celsus* there treats, which are those which strangle, wherein there is hardly any hope of retrieving the Patient, if the strangling be not manifestly got off before the third day; so is that generally manifestly false when he says, *But in case of a violent Fever, to Bleed in its very impetus is to cut a Mans throat, therefore a remission is to be expected.* I confess indeed, if we know there will be a remission, as we see in intermittents, or indeed in continual that come towards the nature of intermittents, a remission ought to be expected, although I never knew it do harm even then, but rather good. I know that I deliver a Paradox; but do not however depart from the reason of the thing it self, but only from the received opinions of Physicians, which as I formerly entertained as true, so by practice and experience I find, and by reason evince them to be either simply false, or for the greatest part departing from truth: Seeing it is certain that Febrile, yea all other morbus *impetus* (or vigors of diseases) can by no other remedy be so easily lessened, weakened and extinguished, as by the very thing from which they use to receive help at their beginning: And from what do they receive greater help than from this, whereby *Galen* confesses that he has often destroyed these impetuous Fevers? If you say that *Galen* has not commanded it in the very vigour of the disease, this will be harder for you to prove, than the contrary for me, seeing he says that as it were by a miracle the fevers were extinguish'd in many a little after, to wit, on the very same day or on the following; which I have also often observ'd. Now this so sudden evacuation of the reliques by sweat had not been, if the disease had been in its beginning, in which the matter is unfit for a natural expulsion: But in those, in whom the reliques of the disease are expelled by a natural evacuation three or four days after the letting of Blood, as in those from whom *Galen* in the cited place says he took Blood on the second or third day, who on the seventh were freed by plentiful sweat, as in a Slave and a Free-man, of whom *Galen* makes mention *lib. 6. m. c. 4.* I say in those, Blood was let in the beginning or augment of the disease; but in others in whom a Crisis follow'd the next day after, or on the very same day, I suppose it to be done, as the foresaid reason teacheth, in the very *impetus* or height and constancy or fixtneſs of the disease, wherein if the end seem suspected, it is safer to assist nature by the help only of Bleeding, and not by Purging, which indeed I always do when I order my Patients my self alone: But where I observe signs of health, though I see great invasions of the Fever, I commit the whole combat to Nature; for I have found by experience that that of *Galen 3. de Crif. c. 2.* is most true: *For no little perturbation in the Patients precedes Critical excretions, seeing some breath difficultly are delirious, &c. whence you may often observe those that sit by them, and unexperienced Physicians to have no more hopes of them than of those who are sentenced to death in the Court.* An experienced Physician only can dis-

tinguish the difference of these, seeing these very bad symptoms precede both deadly and healthful Crises alike: Therefore only the prudent Physician can rightly discern when in the said *impetus* 'tis fit to assist nature, and when to let her alone. But if you ask what is best to be done in a doubtful case, namely when we can hardly distinguish an healthful struggling from an unhealthful, Whether is it better to abstain from Bleeding, or to use it? Certainly 'tis safer to use it, because it will do no harm to him that is about to recover, and it may perhaps preserve him that otherwise would die; nor by doing so (if you offend not in other things) shall you act contrary to *Hippocrates's aph. 20. 1. What things are judged, &c.* And at what time can you do it more opportunely (if a better occasion be slight) than while nature is in her extreme conflict, in which if she be conquered, there remains no further hope of escaping? There is no reason therefore that we should be moved by the opinion of *Celsus*, that was a more eloquent Author than learned Physician, which opinion he presently extenuates, and that rightly, when he adds, *If it do not decrease, but have ceased to increase, and there be no remission hoped, then also, though it be worse, yet that only occasion is not to be omitted.* In this place verily *Celsus* shews himself to be rather a Rhetorician than Physician: For if it be to cut the throat of a Patient, to open a Vein while a Fever is violent, how then does he advise it to be done if the Fever do not decrease? For what can there happen worse to a Person in a Fever than to be stabb'd by that which is in the place of a Remedy; or if he think that it may be sometimes profitable in that case, why said he so absolutely, *to cut a Mans throat*? Moreover if in a notable Fever wherein there is no remission hoped for, the only opportunity of Bleeding be while it is in its state and vigour, (which he means when he says *if it do not decrease, but have ceased to increase*) how is this occasion worse? For these things seem to imply a contradiction. Therefore I conclude with *Celsus* himself, that Blood ought to be let in the very state and *impetus* or height of the Fever, if there be no remission hoped for therein, which I do against the opinion of vulgar Physicians, that have in their mouth continually *aph. 20. 1. What things are judged, &c.*

I have therefore on this occasion let Blood in many, even in the greatest *impetus* of the disease, as in Mr. N. who was ill of a continual, violent Fever, but somewhat of kin to a Tertian, with very grievous Choleric vomitings in the very time of the exacerbation. Being called to him but on the fifth day about noon, at which time his Fever was very dangerously high, fearing lest his continuing to strain to Vomit without bringing up any thing might break some inward Vein, or some inflammation might invade the agitated parts, or the restless straining to Vomit and the Fever might so grow upon him that afterwards there might be no place for remedies; I therefore order him to Bleed presently to fifteen ounces, which remedy proved so seasonable and effectual that the provocation to Vomit ceased even while the Blood was a running, and the fever abated, and declining by degrees was quite cured on the seventh day. I did thus not only on the day of the exacerbation, but also in the very hour of the greatest affliction. The like I did in the siege of *Rachel* in many up and down in the Army; that were ill of a very violent and greatly putrid Fever, yea that was somewhat pestilential: Of all which Patients of mine not one died that used Venesection.

Wherefore

Wherefore, to return, I say again, that Bleeding is a most effectual remedy when the disease is urgent, where the end is suspected. Whither belongeth that of Celsus lib. 2. c. 10. *Blood ought to be let when any one is strangled with a Quinsie, and when the foregoing fit of an Ague almost killed the Patient, and 'tis probable the next may be as bad, and the strength of the Patient seems not able to sustain it.* Which ought to be understood both of an intermitting, and continual Fever that has exacerbations, for this ought to be done in both, and in any other disease (save where there are no hopes of recovery) wherein there is greater suspicion that it will grow to a greater height, than decline. And that is the whole time of the vigor or state, according to Physicians, whilst the disease for some space of time seems to maintain an equal combat with the strength of the Body; not but that it is either increased in it felt, or in some regard diminished, but it is unknown to us.

LVII. And shall this remedy be thought unprofitable in the declensions of diseases? Some have thought it to be so, for this reason, That nature can overcome the residue that is left, if she could lessen that which was greater, in the state of the disease. That indeed has for the most part been observed, yet often also it is false according to that of Hippocrates, *Those things which are left in diseases, use to cause relapses.* Some say here that these reliques of diseases ought not to be taken away by Bleeding, but Purging; but I am of the contrary opinion, namely rather the former way than the latter, yet not in all diseases, but in very many. See the reasons §. 29. of this chapter.

Leon Bo-
tal. l. de
cur. per f.
m. c. 22.

LVIII. If it happen that there be a great necessity for Bleeding, but the strength be very languid from the beginning of the disease to the very state, and Bleeding were neglected at the beginning, What is to be done in such a case? We must know that before all things the feebleness of the strength is to be consider'd, whether it arise from oppression, or from resolution. If the strength be oppressed, seeing it suffers nothing in its own nature, we must not omit to Bleed, though we did omit it in the beginning. On which account Hippocrates 4. de rat. viſt. in Acut. and Galen in commentar. admonish us to let Blood in the case of the intercepting of the Blood and shutting of the Veins. But if the strength be resolved and suffer as to 'tis essence, I had rather with Sennerius (de febr.) follow Galen in this case, who persuades us to omit those remedies that may cast down the strength of the Body and get the Physician an ill fame, and to use prognosticks, rather than by a doubtful remedy to take away the remainders of the strength with the life: For it is contrary to all method of cure, to exhaust more the vital spirits which are already exhausted: And we consult more for the dignity of Physick, if in such a case we insist upon comforting things and expect a convenient time for Venesection.

Hofman.
m. m. l. 1.
c. 13.

LIX. In the progress of diseases, especially Fevers, that there is no place for Venesection is determin'd by Foubertus. 1. Because of aphor. 23. 2. *In the beginning of diseases if any thing seem to be moved, move it then,* which Galen also understands of Phlebotomy. 2. There is no place for it where Purging is most required; but seeing as the disease proceeds, the febrile intemperies does daily corrupt the Blood, and seeing it makes it feculent, serous and ill coloured, it becomes clear that purging is rather required. 3. The strength being brought down by such a taint of the Blood and the continuance of the disease, does dissuade from it. And let us suppose that the tainted or infected Blood is also evacuated by Venesection, yet this will not be with fruit, because the good Blood is diminished with the offending humours.

On the contrary Gaudinus often Bleeds in the progress of the disease. 1. Because the Cacochymy which a febrile intemperies introduceth upon the Blood (when the Fever is vigorous) has always a preternatural heat, which is not only alter'd by Venesection, but a good part also of the offending matter evacuated. 2. As often as the faults of crudity shew themselves, and there are new putrefactions, if the Patient be not very weak, Blood is conveniently taken away: And though in the progress of the disease it be done a second or a third time, it is neither unseasonable nor unreasonable. 3. Is it not true in all Venesection that all things are moved inwards, all places are made more open, and all the humours better scattered, which things are of great moment for the cure of Fevers? 4. If for the sake of a Cacochymy Blood be withdrawn in the beginning, why not also in the progress of the disease? These things being laid down, Gaudinus concludes, that in each Plethora (the mother of Fevers) if the strength consent, 'tis profitable in the beginning of the disease to withdraw that which is shut up in the coction of the Blood, and that not once, but a Second and a Third time, more largely in that Plethora which is such with respect to the Vessels, more sparingly in the other which is burthen-some and offensive to the strength: and in both again more sparingly in the augment of the disease, and more largely on the first days thereof. And a little after: Seeing there are many kinds of Cacochymy, Purging is a proper and an accommodate remedy for them all, whereby the impurity is withdrawn and evacuated sooner and more easily, or slower and more hardly, accordingly as the parts of the body are situated: Yet in a Cacochymy of the Veins, Blood is let for many reasons; yet so as that what is not drawn forth by Venesection, be drawn forth by Purging. Here I will only mention a febrile Cacochymy, which is far more profitably taken away by Bleeding again and again, than by Purging; because either all of it is drawn forth, or at least whilst we have drained a great part of the impurity and vitiated matter, Nature will the more easily concoct, put to flight and drive forth the remainder; or being concocted, will rather commit it to the Physician to be driven forth. To Foubertus's reasons I answer, 1. To the Aphorism, *In the beginning of diseases, if any thing seem to be moved, move it then,* &c. That it admits of its limitation, inasmuch as such a beginning only is particularly understood, where the matter is turgent: Whereas otherwise the augment may seem fitter for evacuation. To the Second, It does not follow that where Purging is required, there is no place at all for Bleeding: This is clear if we consider a Cacochymy in the Veins. To the Third, Respect ought always to be had to the strength, which may be often sufficient in the progress of the disease. To the Fourth, Doubtless there is greater benefit from a large evacuation of the corrupt Blood which partakes of a natural extinguishing quality, than harm from withdrawing out of the Veins a small quantity of that which is pure; because this latter will soon be made up again, as soon as the other is drained forth, which through its impurity does not only spoil nutrition, but by degrees will vitiate and corrupt that which is pure.

Greg.
Horst Inst.
med. disp.
18. qu. 22.

LX. If in the middle of a disease, or even in the beginning, Blood begin to flow out of the Womb, Physicians lay so great stress upon the benefit of that region, that though it flow out of the usual time, merely Symptomatically, they dare not use any other evacuation, which may chiefly stay that fluxion: Whence it comes to pass that in the cure of acute diseases they often incur great danger by such scruple: As when in the beginning of a Pleurisie, or Peripneumony,

or

or burning Fever the Terms begin to flow, there are few who do not let slip the opportunity of letting Blood, out of a Vein; or if in any acute Disease they dare do it, they do it in the Foot; induced; as I suppose, by the benefits of that region, and being affrighted by the dangers that are wont to happen upon the suppression of the Terms. But it doth not become Artists to receive any matter so indistinctly. That evacuation of Blood by the Womb which is natural, is indeed profitable unto Women in many regards, and is generally suppressed with great prejudice: Yet that evacuation is not alwayes made with a like benefit, and therefore neither is it stopt alwayes with the same danger: But the like happens commonly in this, as in other Evacuations; If they be made well, they are good; if ill, bad. We must therefore consider, not only from whence the Blood flows, but whether it flow seasonably, that is, whether at that time when there may be made a Crisis of the Disease, and when the Terms us'd to flow; or whether at neither of these times, but while the Disease is yet crude, and the Month is not yet quite come about; or whether it be come about, but the Disease is not ripe for a Crisis; or whether it be ripe for a Crisis, but the Month is not yet come about. For if the first happen, you may esteem the evacuation to be very seasonable, and that the mensrual evacuation of the Body and solution of the Disease have happily jump't upon the same time: You shall therefore give way to such an evacuation, if it be made entirely; if not, you shall help it by all means: Therefore you shall open no Vein, or if you do, it must be in the Leg; but make no other evacuation. But if the evacuation be seasonable in neither regard, then matter it not, but let Blood where and as much as the Disease requires, abating only so much of the quantity, as you think may be supplied by the fluxion that casually happens. Therefore if it be a Pleurisie, let Blood out of the Arm of the same side, not mattering though it flow out of the Womb: For seeing that Disease is urgent, it requires to be soon taken away, but it does not require to be cured by so unseasonable an evacuation: It is the convenience of the region alone that seems to require it; but that is of no great moment when so many conditions gain say it: 'Twill be sufficient that this evacuation be not stay'd on this account by the use of astringents; you shall therefore abstain from these, but let Blood from whence the Disease requires. If that evacuation come before the usual day of the Month, and yet happen fitly for a Crisis of the Disease, the rule of seasonable Crisis shall be observed; If the flux be large enough, to let it alone; if not, to help it, but upon no account to hinder it, nor to divert to another place, or to attempt another evacuation: And if it be unseasonable for the Disease, but come at the due time of the Month, if so be the Disease be indifferent to upper or lower evacuations, as suppose the Stone in the Kidneys; or be without any certain seat, as a Fever; Blood shall be let out of the Leg, if there be need to let it: But if the Disease require evacuation by the upper Parts, and be urgent, the Physician may let it alternately, both above and below; and while he lets it above, to retain it below by some art, as by Bands, or Cupping-glasses, or otherwise, &c.

Vallef. m. m.
l. 2. c. 13.

LXI. A Vein is not to be opened in the time of the mensrual Purgation, lest we hinder or precipitate the motion of Nature: But this is to be understood only on condition that natural evacuation exceed not nor come short of the due measure, either simply, or with respect to the urgency of the Disease: For if the Blood burst forth in too great quantity, then it may be safely let out of the Veins of the Arm. Moreover if there then happen any grievous Disease that requires a sudden evacuation,

and presses the upper Parts, it may be let out of the upper Parts, as in a cruel Pleurisie, or a suffocating Quinsie: For if then you let Blood out of the Foot, or expect the motion of Nature, that that may suffice the *Plethora*, or the acuteness of the Disease, the Patient will die before that tedious evacuation can do any good: Wherefore regard being had to the more urgent Malady we must let Blood out of the upper and nearer part, Cupping-glasses being first set upon the Thighs, or the Legs being rubbed, or Blood being let out of the Foot, that both Indications may be satisfied. Again if the mensrual Purgation be too little, and reflaginate to the upper Parts, and Spitting or Vomiting of Blood follow, 'tis the safest to open the Veins of the Foot, according to *apbor. 5. 32.* Besides, if the mensrual Blood actually flowing be not proportionable to the *Plethora*, how can we supply that imperfect motion but by Venesection? which *Galen 9. Meth. 5.* teacheth. For though, when the Disease is placid, mild, and accompanied with good signs, it be unlawful in the flowing of the Terms, rashly to disturb Nature's motion; yet if it be not perfect, nor proportionable to the *Plethora*, we must compleat it, lest by delaying the Remedy the Disease obtain an increase.

Zacut. Prax.
hist. lib. 3.
cap. 9.

LXII. The *Vena Porta* contains a Cacochymie in a morbus Body, which 'tis doubtful whether it be safe to empty by a manifold Venesection, lest the Blood flowing back into the larger Veins appointed for the circulation, infect the whole mass of Blood. ¶ Lest the impurity of the first ways be drawn into the Veins by Bleeding, that ought first to be removed: but this danger attends not all letting of Blood, but only that which is plentiful according to the custome of the Ancients.

Riolan. En-
chir. Ana-
tom.

LXIII. If the strength permits not the opening of a Vein in the Arm, *Avicen* says that the Forehead Vein is to be opened in the Phrensie; out of which, as being less, Blood flows in a less quantity, whence there is less loss and dissipation of the Spirits. This document is to be observed not only in the Phrensie, but also in any long Disease; so that if the strength be not very robust, 'tis safer to open the lesser Veins. Wherefore Practitioners are not to be found fault with, who in long Diseases open the *Salvatella*.

Capivacc.
cap. de Phre-
nit.

LXIV. Yet it is to be noted, that it is better that a little Blood be drawn forth at several times, than that much be evacuated all at once: The reason is, because there have been often observed notable harms, yea death it self to have come upon letting forth a great deal of Blood at once, never from taking a less quantity of the same, though by repeated Bleedings there were at length the same quantity extracted.

Franc. de le
Boë Sylv.
prax. l. 3.
c. 4. §. 107.

LXV. Those who think in Venesection that Nature if she be strong, does alwayes send forth the vitious Blood, and retain the good; because they see that in venesection made to fainting, the Blood that is first sent forth separates into parts, but that which comes out last abides alwayes one and the same; those I say are deceived: for the reason why the latter Blood separates not, is not because it is good, but because it issues drop by drop, and spurts not out of the Vein so vigorously as the former: both of them consists both of good and bad Humours.

Walaeus m.
m. p. 34.

LXVI. Those erre who prescribe fasting and venesection at once; for this cannot be done without the great damage and danger of the Patient. For *Galen* has admonished us that the Sick are more hurt by undue and unseasonable evacuations, than helped by convenient and seasonable, because of the resolution of the strength that succeeds those evacuations. Now those are undue and unseasonable, which are made use of after fasting: as *Galen* has declared in his Book of Venesection against the *Erasistratians* that lived at Rome. Nor

R x r r r

hinders

hinders it that *Hippocrates lib. de vict. acut.* prescribes fasting after venesection; for he does not mean an abstinence for several days, but only for a few hours after Bleeding. Now we mean that fasting which continues for one day or more without any meat at all, or a longer time with a little: And in these there is neither place for Bleeding nor purging.

Aug. Ferrer.
castig. cap.
18.

LXVII. In Bleeding there often happens a swooning or fainting away, which uses to cause greater fear in those who are present, yea in Physicians that are young Practitioners, than harm to the Patient. Yet this happens not through the fault of the Artift, but the softness of the Patients mind, which too readily disturbs the Spirits in the Body, and almost ties them up, when he seems to be giving up the Ghost as it were: yet this is prevented with a little to do, namely if the Patient lye along, and hold some liquor, as suppose Water or Wine, in his Mouth, whilst the Vein is cut and the Blood flows out. If he faint notwithstanding, stopping the Blood by laying your thumb upon the orifice, sprinkle his face presently with cold water; if the fainting continue, pinch his nose also; and when the fainting is over, taking off your thumb, let as much Blood be taken as seems good to the prudent Artift; and cease not to bleed, as the over fearful use often to do. If the fainting take him as he sits, we must help it the same way as it might have been prevented: let him presently lye along upon his Bed, or be gently laid down upon the floor, sprinkling his face with cold water as is before said, for the Artift may easily be aware of its coming if he look upon the Patients face or observe his pulse; for that looks pale, and this varies its beating. But as it is easily perceived, and raised on so slight an occasion; so the Patient is neither dissolved, nor is it difficult to restore him to his former senses; though in its coming it bring in some frightful jactations of the whole Body, evolutions of the Eye-lids and Lips and other like things, which yet soon vanish: which is not done in that swooning that follows upon superfluous evacuations.

Leon. Botallus
de modo
incidendi
venæ § 20.

LXVIII. It is usual for skilful Physicians, when there is need of both purging and Bleeding, if the Patient be afraid of the one (though it were fit to be first done) to use the other. In which matter the opinion of *Paulus* and *Oribasius* is to be taken warily, as also *Galen's* 12. method. and one is not rashly to be substituted for the other. These teach, That if any be not bled because he is afraid of it, &c. we must evacuate the plenty of matter either by Urine, or by unlocking the passages, or lenise and cool the Fever, or purge more largely by stool. Which opinion is very contrary to the rules of physick: inasmuch as whilst Blood is redundant in Fevers, we may not lessen it by purging, nor by urine or sweat; for such things would be hurtful when the *plethora* is not first taken away, with the evacuation whereof *Galen* always begins. Nor can fear excuse, nor cause that such things as will hurt may not hurt, whilst there is a plenitude in the Body: for if we purge, we leave an equal quantity of Blood: if we provoke sweat or urine, we take never the more from the plenitude: Unless we thus expound *Galen's* viz. That when Blood is not let in the first days of a Disease, it by and by degenerates into other Humours which must be purged: But this advice of *Galen* is not so to be understood, as if we should purge at the same time we ought to bleed. For in Fevers 'tis needful both to purge, and provoke sweat and Urine; but one cannot be done in the room and season of another: Wherefore the Patient is to be forced to bleed but if he cannot be brought to it, having pronounced the danger of neglect, 'tis safer for cooling of the Fever to satisfy the indication in some measure with Leeches and Cupping-glasses with scarification; and if he will not admit of these, then 'tis best to go away and do nothing at all. But in other Di-

seases, where the necessity of one or other is equal, we must perform that which the Patient shall choose: but unless you use either purging or Bleeding first, we cannot provoke sweat or urine without hurt; for those do not excuse the necessity of purging or Bleeding. But in such as are let Blood for a pain, fall or blow, we may safely provoke sweat instead of Bleeding, which Nature of her own accord uses to do with great relief. But when there is need of both Remedies and the Patient refuseth both, the difficulty is greater: we must then follow *Aëtius's* counsel l. 3. f. 4. c. 17. Some are so fearful and extremely soft, that they cannot endure the name of either Bleeding or Purging: It were not only better, but also more fortunate, never to meet with any such: And yet if we be forced to take care of such Patients, we ought to predict that they will be long troubled with pains, watchings, rackings of the Joints, especially if the influx of the Blood be thick and much. Therefore abstinence is to be enjoined, indifferent from Clysters are to be injected; things are to be applied to the Navel, and when the Belly is loosened, we must use discussing ointments and frictions, &c.

Mercat. libid.
cap. 7.

Galen 4. de san. tuend. c. 4. says thus: If any either through age or fearfulness will by no means yield to be bled, the same must be more largely purged; or if he be afraid of that also, what is superfluous must be drawn forth some other way. From which it is clear, that where the Disease requires Bleeding, if the strength cannot bear it, or because of age or for some other reason we may not undertake it, then we must use purging which may evacuate Choler, Melancholy and Phlegm: for 'tis better that Blood alone should superabound, than that the other Humours should do so as well as it; And moreover part of the plenitude is taken away by purging, and the Humours are more readily ventilated. But if the Disease depend both on a *plethora* and *Cacochymie*, for this the Belly is to be purged more freely than it would need if we had leave to open a vein, namely that purging alone may supply the place of both evacuations.

Zacut. Pr.
Hist. p. 569.

¶ If phlebotomie cannot be made, whether can purgation alone, or sparseness of Diet, or exercise, frictions or sweating supply its place? I believe its place may be supplied if there be no Fever present, especially by such things as exhaust the Serum out of the Veins: for by this means the Veins being emptied, the rest of the Body may be extenuated; and this foreign Nations do, which are afraid of Bleeding.

Riolan in
Erich. Au-
gen. tom. 1.
Epistol. p.
77.

LXIX. Two things hinder a *Cacochymie* from being easily taken away by purging; The one, when the Body is not liquid and fit for expulsion; The other, when the noxious Humour tends not at all towards the ways of purging. That Body is not liquid, wherein the noxious Humour is immoderately thick or viscid and not at all fluxile, or wherein there is so great an obstruction of the Liver or lower Veins, that there is hardly a way open by which the Humour can be derived out of the Veins by the Belly: In such case therefore the noxious Humour that is shut up is to be taken away by Venesection, lest being turgent there with fury as it were, and intercepted in the passages, it should break in upon some noble part and fasten it self there. The other impediment of purging a *Cacochymie* is, when the part affected is seated so far from the ways of purgation, that the noxious Humour cannot be dissolved and derived into them: in which event and condition of things a large and apparent Vein is directed, which shall be opened if the greatness of the Disease and symptom persuade. So if a phlegmatick distillation rushing upon the fauces or Lungs be like to suffocate, it is taken away by venesection.

Fernel lib.
ratione.
de vacuandi
ratione.

¶ 'Tis more convenient to use Bleeding before Purging, than this before that: for this loosens the wayes, which the Body needs very much in order

order to its being purged; the *other* weakens the strength, than which there is nothing more dangerous in order to bleeding. Again, impurity resists not bleeding, but repletion hinders purging. Therefore 'tis more unprofitable to let Blood that is already purged than before it was purged, unless it happen that by the purging there is raised a new heat in the *viscera* (which chiefly falls out when a sufficient bleeding did not precede) for then nothing is more adviseable than to bleed after purging. Otherwise when there is need of both evacuations, bleeding must precede for the *aforsaid* reasons. Whence again it comes to pass that bleeding alone does oftener perform the cure than purging alone, namely because that evacuation is the first in order: and it is more natural that that which is latter should succeed that which is first, than that which is first, that which is latter: Therefore upon bleeding, the Body is often Purged on Nature's own accord either by a Looseness, Vomit or Sweat following thereupon: But upon purging the Body there seldom uses to follow a flux of Blood, unless sometimes the *menstruous*, nay neither can the Body be well purged when the *channels* are full.

Vallef. m. m.
l. 2. c. 3.

¶ It is manifest indeed that in every kind of repletion of the Vessels, especially a Plethorick, if we first evacuate the Body by bleeding, the Purge that we give afterwards shall find the Veins and Passages of the Body not so filled and obstructed, but that its vertue, by the guidance of Nature, may penetrate through the whole bulk of the Body, and with great easiness bring forth the noxious Humours: But if the Vessels be filled with Blood or other Humours, and the Veins about the Liver and Mesenteric be obstructed, the Purge will cause intolerable Gripings, and Faintings, and will pull the Veins indeed; but draw nothing therefrom worth speaking of. Wherefore, *Hippocrates* in almost all acute Diseases (*q. acut.*) wherein the Humours are not turgent, in a Phlegmon and other internal Tumors and Apostems of the *viscera*, and in such Diseases as have all the Humours increased in an equal proportion, begins the cure with venesection, if the Strength and Age of the Patient give leave. But if only one of those Humours abound, or be putrefied, or there be but a small quantity of good Blood, and it be overcome by the plenty of other Humours, then he begins evacuation first with purging. In the discussion of this Controversie, we (with *Avicenna*) name those Purgers that purge electively, whose vertue is dispersed beyond the Liver, through the whole Body: But we do not reject the use of those which they call *Lenitives*, and Clysters made of them and of a Decoction of Medicines that open Obstructions and incide viscous Humours; I say we do not reject the use of these before bleeding and purging, for washing away the filth of the Stomach and Intestins, lest the vertue of the Purger be destroyed thereby, and lest for avoiding *vacuum* they enter the Veins emptied by Phlebotomy, that the obstructed passages of the Veins of the Mesenteric may be also opened by these. Yet the right administration of all these things depends on the conjectural Judgment of the Prudent Physician.

Joh. Langius
Ep. 17. l. 1.

¶ What we have said of Bleeding before Purging has place chiefly when the Disease to be cured is urgent, and there is danger in delay. But when there is nothing urgent, and the Physician has time enough to do by degrees all that is requisite, 'tis no great matter where he begins the cure, whether with Bleeding, or Purging and evacuating the offending Humours, though I am of opinion, unless peculiar reasons dissuade, that 'tis always safer to begin the cure with Bleeding, as often as there is occasion for letting it forth also; I say unless peculiar reasons dissuade: Thus when the *Air is wet and moist*, as 'tis safer and more convenient then to Purge than Bleed, so Purging shall be used in the first

place: And on the contrary, when the weather is fair, Bleeding is performed with better success; on which account the more Prudent Physicians wish and observe fair weather for venesection. So as often as much Phlegm and Choler abound in the Body, and there is therefore greater need of Purging than Bleeding, 'tis better then to premise Purging, and that indeed more than once, before a Vein be opened, because it is not supposed that the Blood abounds then so much as other Humours.

Sylv. de le
Boc. Prax.
l. 3. c. 4.

LXX. If there be a fault in the Humours (as is usual) from a mixture of a Plenitude and a Caco-chymie, it requires very mature advice as being a very difficult case. The first thing to be consider'd is the difference of the Humours that are collected in the Veins; for when either *Plethora* prevails, Blood shall be let largely till it be reduced to mediocrity; this one Remedy easily lightens and recreates the burthened strength or vital faculty without prejudice, nor is there then any occasion for Bleeding. But when the Veins are filled with an impure Blood, suppose the fault be from a mixture of a Plenitude and Caco-chymie, it requires both kinds of evacuation. Lastly, if the Blood that fills the Veins be too hot and mixt with much Choler, Blood is presently to be let, but more sparingly than in a simple *Plethora*, only so far as to prevent the dangers of Plenitude: And that which remains, requires to be driven forth, not by venesection, but Purging; which shall be done more safely after taking away some Blood, both because the Body is cooled by Bleeding, and also because the fear of encreasing the disturbance or obstruction is now taken away. See before, § 4, 5. of a Phlegmatick and Melancholick Plenitude. If (as we may see in Quotidian Agues and other Phlegmatick Diseases) necessity often cause us to let Blood, it is to be done sparingly and dividedly, as the strength and continuance of the Disease permit. Lastly, every Plenitude, defiled with the mixture of Phlegm, Choler or Melancholy, or some other Humour, does first indeed require Bleeding, but in such a quantity as the nature of the Caco-chymie shall permit; and then the Belly is to be loosened, that the noxious Humour that remains, may more fitly be purged off. But if there seem to be a great Caco-chymie, we must attentively examine whether a Fever be kindled by it, or not: for if there be, we must begin with Bleeding without delay, and put off Purging, till there be occasion for it, viz. when there has been Concoction (unless the Humours be turgent:). If not, we may bleed indeed, (if there be a Plenitude, though but small) but we must Purge the more largely and quickly. Lastly, the less Blood is to be let, by how much the Caco-chymie prevails, because in that constitution of the Body and Disease the vital faculty uses not to be so firm: on which account, unless the Veins be full above measure, and great danger be impendent, or the case happen to be as we have said, a slight Purging shall supply the place of bleeding, and that often repeated, especially if the Patient be afraid of being bled. But if it happen that a Plenitude and Caco-chymie be equal, we must not, as some think, begin indifferently with either purging or bleeding, but in such case it will be fit to consider whether this Plenitude of the Vessels cause Obstruction, which requires that venesection should precede upon a double account; both because we must take away such obstructions before Purging, which in the case put shall be more conveniently done by Bleeding; and also, because this obstruction hinders Purging Medicines: for whilst the obstruction and plenitude remain, the vertue of the Medicine cannot penetrate, especially seeing a purging Medicine does both by its heat and attractive faculty exagitate the Humours and disturb the Body; which when it is Plethorick, falls into greater danger, whereby it comes to pass that

that Bleeding ought by all means to precede, *Galen* affirming the same *l. 2. ad Glauc. c. ult.* who bids us begin with that without which we cannot safely perform the other. Nor is this enough as yet, but we must also consider whether a Fever arise from such Plenitude and Cacoehymie, for this gives us a more certain hint that we should bleed first, unless some of those things which *Galen* reckons up gain-say; for when the Plenitude is diminished, whatsoever putrid, or otherwise tainted Humours remain, we may the more easily afterwards draw them forth by a convenient Region: But in others, while the faults of both are equal, and there is no Fever present, it will not be improper to begin with either, so long as one is not more the cause of the Disease than the other, for in such case we must begin the cure at the greater cause of the Disease.

*Merret. de
Præsid. lib. 1.
c. 7.*

LXXI. The sooner we bleed the better, and therefore there is the chief and greatest occasion for it in the beginning: wherefore those erre greatly who always begin their cures with Purging, and take great care to use it before bleeding from any light suspicion of crudities. Indeed 'tis most certain that the abundance of crude Humours in the Belly is an impediment for bleeding, because they are snatched from thence by the newly emptied Veins, and being snatched, either by lighting into narrow passages they cause obstructions of the *viscera*, or being carried into wider they fill the whole Body with crudities and vitiate the Blood, or cause both: and doubtless these ought to be concocted or evacuated before bleeding. For which reason, believing that the Belly can be cleared of crudities no other way, they Purge always before venesection; whereas *Hippocrates* (*l. de vict. acut. 41. & 4. 36.*) thought that in a manifest satiety it was enough to pass one day without eating, or to use a Clyster: whence all others almost now adays take always care to empty the Guts by a Clyster an hour or two before bleeding, namely lest the thin parts of the *fecies* should be derived into the Blood and taint it. Which though it be more tolerable than while the Vessels are yet full, to disturb the whole Body by Purging; yet besides that it is undertaken to no purpose save where the Guts appear manifestly full and there is a sense of weight in them, it is not without harm, and sometimes such as is very great: For many being not sufficiently evacuated by the Medicine newly taken; the Belly is disturbed in the very bleeding, and they faint away unseasonably, so that the bleeding is hindered and the faculties very much weakened. Wherefore I use no such Clyster, unless when there is a peculiar and manifest necessity thereof, as when any of the aforesaid things is present; and if I be to use it, I cause it to be administered, not near the bleeding, but a long time before; namely that the motion which it raises may first have been layed, especially seeing bleeding it self uses to move the Humours of the Body, which often are carried of their own accord into the Belly: Which motion being added to the former which the Clyster had raised, becomes too great, and before the bleeding is ended brings the said dangers. Wherefore I think it far more adviseable, where the weakness of the faculty hinders not, to use a Clyster presently after bleeding, that, when the bleeding has been managed well, that which has been moved and agitated by it, may be drawn into the Intestins and evacuated by them: which we have often seen to succeed so well, that a man is evacuated and purged without taking a purging Medicine: But then let the faculty be firm, for if either the Guts be not manifestly burthened, or the faculty not very firm, I will use no Clyster neither before, nor after, contenting my self with bleeding alone that day.

*Vallesm. m.
lib. 4. cap. 2.*

LXXII. *Fernelius* gives good advice (*l. 2. de f. m. cap. 4.*) Nor do I after the manner of the unskillful presently command bleeding, if the Nose do but drop a little Blood, or the Urine look ruddy: for the Blood is apt to burst forth not only from Plenitude, and because Nature attempts that evacuation, but from many other causes. For such as have the mouths of the Veins eaten asunder, or in whom the viscera and especially the Liver is grown weak and scirrhus, often bleed at the Nose, as hydropical Persons use to do.

LXXIII. Some observe certain days to be unfortunate and unhappy both for purging and bleeding: But I have oft found by Experience that such observations are nothing worth: First, because the Heaven is an universal cause which acts not unless the particular causes be well disposed: Secondly, because Astrological Judgments are very uncertain, various, ambiguous and deluding those that make them, through the diversity of the nearest causes: Therefore 'tis rash to admit of an Astrological Judgment in a sick Person, when occasion is very urgent. ¶ Seeing the course of the Moon for the most part causes damages and detriments unto infirm Bodies, it may be brought into dispute, whether a Vein may be opened in that part, wherein the Moon abides? For most are fearful in this thing, nor dare they attempt any such thing, be the Disease never so urgent, and require such a Remedy never so speedily. But I think that it ought to be attempted maturely without trepidation and with great confidence of relief and driving away the Disease; for acute and swift Diseases admit of no truce or delay. Nor ought any one to be deterred or desist from his undertaking, though he attempt it while some Planet is adverse or malignant. Thus in a Pleurisie, Quinsie, Inflammation of the Lungs and Liver, neglecting the scrupulous Observation of the Stars and Aspect of the Planets, we must hasten maturely to venesection, even in that Part which the Moon is posses of.

*Hor. Augu.
de Venæ
Sect. l. 3.
c. 19.*

LXXIV. 'Tis ridiculous that some will let Blood only from seven till twelve: For says *Galen l. de sang. mis. c. 10.* Fear not to let Blood even in the night; yea on what day soever you find indications for bleeding, do it, though it be the Twentieth day from the beginning, if so be the faculty consent. And *cap. 11.* he bids us open a Vein at any hour of the day or night, if so be in Fevers or Agues it be done in the remission of the Paroxysms.

tur. Mirac. 4.
c. 15. See
more in Arn.
de Villano-
va, Guido,
Joubertus,
Borallus, He-
urnius, Clau-
dinus, &c.*

LXXV. Though necessity urge, if the Patient have newly eaten, let bleeding be deferred a little till the fresh juice of the Viſuals be past into the Blood; for the Veins being emptied will snatch into themselves the Chyme that is not only crude, but oft incongruous and unproportionate to the Blood: whence not only its motion is disturb'd, but the vital flame also is sometimes in danger to be smother'd. I have known some that having been let Blood after drinking too freely of vinous Liquors, have fallen into terrible fainting Fits, that have lasted very long till the vital Spirit, being half overturned, hath recover'd it self again.

*Heurn. m. ad
Prax. l. 3.
c. 9.*

LXXVI. As soon as the quantity of the Blood to be let is resolv'd upon, then the next care ought to be, that by making a large orifice the same may flow out equally mixt in as little time as may be: for otherwise if it shall issue forth at a little hole, either drop by drop, or in a small thread, the mass of Blood fermenting will sever into Parts, and that which is subtil and more spirituous will spurt forth, the thicker and feculent part staying behind. Whence we may observe that if Blood be at any time let out of a large orifice with a full stream, and be stop't a little by laying ones finger upon the hole, and then be suffer'd to flow again a little after, the Blood that comes out at the second time will be far purer and brighter than that which came forth at first, namely because in the interval

Willis.

of

of the efflux the more subtil Particles being extricated out of the thicker and united together, have prepared themselves for flying out. Wherefore if Hippocrates's Precept, to let Blood till it change colour, be to be observed, we must see that it run out speedily with a full, and uninterrupted stream.

Idem.

LXXXVII. Why does bleeding by a large Orifice cool more than bleeding by a strait, when the quantity of the Blood that is let is equal? Because there is made a more sudden change in the Body when the Blood is poured forth by a large hole: namely because there is a greater withdrawing of the Blood that is a returning to the Heart, whence there ensues a less influx of Blood from the Heart into the whole Body, and hence all the Parts are cooled. Add hereunto that the quick withdrawing of Blood is followed by a sad sensation in the heart, and from thence with a straitness thereof, likewise with a less effervescence of the Blood, its expansion being hindered, all which things lessen the heat in the Heart and the whole Body. Moreover by a quick and hasty evacuation of Blood transpiration is more promoted than by a slow. Whence conclude, that Venesection by a large orifice cools more, not because thicker Blood is then poured forth, but because it flows forth quickly: For the Blood that is poured forth by a narrow orifice is as thick as that which issues out by a large, (seeing none will deny that all the Blood is percolated through the capillary Veins; wherefore the orifice can never be so small, but its width will exceed that of the capillary Veins) only it comes out more slowly, which is common also to that which is more thin. I wonder that those who think otherwise have not observed in their Hypothesis, that the thinner Blood is the more hot, which therefore if it were let out by a strait orifice, and the thick retained, the Body should be more cooled, than when the thick and less hot is poured forth.

Fr. Bayle
Probl. 3.

LXXXVIII. Those who let Blood should observe the situation of the Valves, for the Vein ought to be opened a good way from them: for if it be opened just by a Valve, the Blood either does not flow out rightly, or not at all, yea sometimes there rises a bump from clotted Blood.

Challov. de
Orig & Met.
Sang.

LXXXIX. Have a care you open not a Vein near its Anastomosis with an Artery; for if this be done, the Blood being all of a scarlet-colour will spurt forth impetuously, and its efflux is not easily stayed, nor is the orifice of the vessel soon shut.

Willis.

LXXX. If when we have occasion to bleed, the Vein do not appear, a large Cupping-glass with much flame is to be fixt upon the Part; and that will make the Vein shew itself.

LXXXI. Some esteem so much of the first time one is let Blood, that they will not use it but in great cases, because they think that, like an unusual and first Remedy, it may cure a man of great Diseases: whereas yet very skilful Physicians write on the contrary, that men suffer more by such things as they are unaccustomed to. Thus Galen 14. Meth. cap. 8. did not let an Old man Blood that had a hot Tumour upon his Tongue, because he had not been used to it. Therefore, say they, he that has been used to be let Blood, if so be his faculties be not as yet impaired by frequent evacuation, the same will bear it more chearfully and lightly than he that has not been so used. But the vulgar opinion seems to be justified by what Hippocrates writes 3. Aph. 28. of the first eruption of the Terms and the first Copulation: And says Celsus, (lib. 2. c. 1.) If any kinds of Diseases have happened in Infancy, and end neither when a Man comes to maturity, nor upon the first Coitions, nor in a Woman upon the first flowing of her Terms, the same are generally of long continuance: And speaking of the Epilepsie, If, says he, Remedies have not removed it, Coition in Boyes, and the flux of the Terms in

Girls does cure it. Pliny also says l. 8. c. 24. That many kinds of Diseases are cured upon the first coition, and upon the first flowing of the Terms: or if that do not happen, they are then of long continuance, and especially the Falling Sickness. Add hereto Hippocrates's authority, who 3. Epid. sect. 2. agr. 12. writing of a Maid of Larisa that labour'd under a sore Disease, says that it was judged (or ended) on the sixth day, and returned not again, which certainly was a rare and wonderful thing: But this he ascribes to her Terms which then broke of her for the first time; when she had the Fever, and it was now judged. Therefore that is not altogether vain which is vulgarly spoke of the first letting of Blood.

Rub. in c. 10.
lib. 2. Celsi.

LXXXII. We must take some Broth half an hour before Venesection according to Hippocrates's advice; Lib. de Ulcer. A Vein is to be opened when a man has dined, and drunk more liberally or more sparingly, and is a little warmed. Some Arabians will have the mouth of the Stomach to be fenced and strengthened with a little Meat, especially in those who have a weak Stomach, or its orifice of a more acute sense, and are otherwise weak: the innate heat is dissolved by the letting out of the Blood, and the choleric Humours rage more when their bridle is taken off, whence there is danger of Swoonings. There is given either Bread dipt in the juice of Pomegranats, or simple water with Sugar and the juice of Lemons for a Stomach that is weak from an hot intemperature, or has bitter Choler floating upon it: Some give a cup of cold water to drink, and so prevent fainting away in such as are subject to it through swift motions of the mind. Galen Comment. in lib. de Ulcer. seems to dissent, advising to defer Venesection so long as may seem sufficient for the Concoction of the Viſuals, and that the Excrements of the Belly may have while to descend. Rhazes (l. de v. f. cucurb. &c.) says, whilst the Viſuals are not digested in the Stomach, or expelled by the Guts, either spontaneously or by a Clyster, let there be no letting of Blood, lest something be attracted of that which is in the Stomach and Guts, to the Liver and its passages, and is as yet crude. Others alledge that the use of Meat before is inconvenient, denying the validity of that Argument that is taken from the impairing of the Faculties. The Bodies of all Sick Persons are not weakened, or resolved by bleeding: such as are oppressed with a burthen of Plenitude or Cacoehymie are rendered more lightſom. They also reject drinking of water before Venesection, seeing Avicenna teacheth, that he that drinks cold water before or after bleeding may fear a Dropſie because of the water's being inatched into the Veins. The truth seems to persuade one to approve of the use of Broths: these may refresh Nature both by way of prevention and cure: Julaps, &c. may be used also as well as these. A draught only of Water or Beer, or a potech Egg, can produce no harm. To the Reasons I answer, 1. The impairing of the Faculties is not so slight in those who are unaccustomed to bleeding, and in the infirm. 2. The more sparing use of Broths, Julaps, a mouthful of Bread dipt in Wine, &c. causes no danger of crudity. Avicenna speaks of an immoderate draught of water.

Rollins. libid.
c. 6.

LXXXIII. It is discussed by some later Physicians, how long we must abstain from Meat after bleeding? Galen after having bled a Young man sick of a Synochus without Putrefaction, gave him some food two hours after: Others have said that we may allow Viſuals one hour or two after bleeding, though not much. But this is a thing for the Physician to guess at, according to the quantity of the Blood that is let and the strength of the Patient's Faculties: For Galen said two hours, because he let Blood very plentifully, whereby his strength and spirits were weakened, so that he fainted away.

ssstt

away; wherefore the Stomach was not to be burthened with Meat at that time. But we that bleed far more sparingly, and do not so diminish the heat, spirits and strength, have no reason to tarry so long: wherefore one hour will be enough; when less than a pound of Blood has been taken; half an hour, when less than half a pound; for the Parts are but little drained, and but a few Spirits are exhausted, and there is made but a small agitation of the Humours. The habit of the Body ought also to come into consideration, as it more or less abounds with Blood, and is more or less dense.

Rubeus.

LXXXIV. Some avoid giving their Patient any thing to drink after bleeding; but *Amatus Lusitanus* proves that it is not hurtful, but wholsom, ordering him to drink presently some cold water: For by reason of the Veins being emptied it is presently distributed into the Body, and cools it more easily, quickly and safely.

LXXXV. Some Physicians forbid sleeping after Venesection, because they believe that the Blood retires to the Heart, which yet is not always true, unless perhaps the bleeding have been immoderate, or the Patient be in danger of swooning through fearfulness. Besides, no reason perswades that such retiring of the Blood is pernicious; for the Blood uses in sleep to retire to about the *Præcordia*, to the great recruiting of Nature: And how great benefit Sleep when it comes does to those Sick Persons that have had restless Nights, every one knows; for it recruits the faculties, and concocts the morbidick Humours; whence we are oft put upon using Remedies to procure it. If therefore it come a little after bleeding, it will be good, both as a *Sign*, because it shews that Nature which was oppressed is now relieved and performs the natural Functions; and as a *Cause*, because when Sleep succeeds, Nature concocts the remainder of the morbidick Humour. Indeed Sleep hurts in the Inflammations of the internal *viscera*, in the beginning of Ague-Fits, in Pestilential Diseases: but why we may not sleep in other Diseases, I see no reason. *Galen* writes that Sleep coming on does indicate the firmness of the Crisis; for it happens sometimes that the Patient sleeps a whole day after the Crisis, if he were long without Sleep before, to the great comfort of Nature: yea it happens that the Patient sleeps sometimes even in the very Crisis. If Sleep therefore help when it comes after other evacuations, why should it not do so also after bleeding? Yea if a man may safely be let Blood when he is actually asleep, what hurt can Sleep do presently after bleeding? *Galen* esteems it as a good sign when the Patient falls fast asleep after bleeding. If any say, that Sleep is therefore forbid lest the bandage should come loose; that is nothing, for by the diligent care of those who wait on the Patient, and right tying of the Fillet, that may be prevented.

Gal. Meth. 9.

vulg. error.
l. 4. c. 26.S. Paul. Qua-
dr. Botan.
p. 396.

LXXXVI. I my self have seen a simple Decoction of crisped Mint stop the circular motion of the Blood so, that not a drop of it would issue out of the Foot, though the Surgeon thrust his Lancet deep enough three or four times into the most apparent branches of the *Saphena* in the Foot for bringing down the Terms in a certain Woman, for whom her Maid had prepared a Decoction of Mint instead of common water to hold her feet in. Whereupon she was bid to provide simple water, into which her Mistress put her feet to above the ankles, and then the Vein being cut again by the ankle, the blood issued forth.

LXXXVII. In the Diseases of Children and Women with Child the Physician consults well for himself and his Patients, if himself be present when they are to be bled: for those who are intrusted with that operation, being too bold do suffer the blood to issue out too largely:

and if any unfortunate thing happen, 'tis presently ascribed to the Physician, though it be very evident to sense that the Artist mistook.

LXXXVIII. When a Nerve or Tendon is pricked by the Unskilfulness of the Blood-letter, see the Cure thereof under the title of *Convulsion*, lib. 3.

LXXXIX. A Nobleman having a troublesome Tetter, and fixing Leeches in the Morning upon the Part affected, when the Blood bursting forth to almost three Pound could be stanch'd by nothing could be done, *Prevotius*, having washed the little holes the Leeches had made, with an astringent white Wine, caused to be laid upon them with good success *Galen's* restraining Ointment of bole Armene and Hares wool.

Rhodius
Cent. 3.
Obf. 71.

XC. Not only the simple opening of a Vein is profitable, but also the cutting of them quite asunder avails to intercept many kinds of Defluxions. The cutting asunder of the Vein of the Forehead is the only Remedy to take away malignant Defluxions upon the Nostrils, as some have experimented: So that I do not wonder that the ancient Physicians, in Inflammations of the Eyes, blearyedness, &c. ordered the cutting asunder of the Forehead and Temple-veins. *Aëtius* cut asunder the Forehead-veins for a continual watriness of the Eyes, and pains of the Megrim. *Haly Abbas* cuts those behind the Ears asunder for curing a *Vertigo*. Yea the Excisions of the Veins of other Parts also are profitable for curing at once old and difficult Ulcers of the Legs and Arms, &c. Now the administration is thus to be order'd; first the Vein must be made to appear as in ordinary Venesection; then a crooked Steel or Silver Needle being thrust under it, the Vein is raised up, and then cut in sunder by a Sickle-like or crooked Lancet thrust in as deep as the Needle, the Vein being suffer'd to bleed as in common Phlebotomy: but for the most part in a slender and thin Skin the Vessel stands so out, that it is not necessary to thrust a Needle in, but the Administration may be performed by a Lancet alone that is very crooked towards the point: I use daily to practise this Piece of Surgery both ways.

Sever. Med.
Eff. p. 67.

XCI. If the Orifice in Venesection be too strait, it must be widened; as in stoppage, or constipation, that must be removed which stops or dissipates. But to amend the straitness, there is greater skill and pains requisite than if the Vein had not at all been meddled with; because the Blood is presently diffused betwixt the Skin and the Vein, and driving the Skin higher separates it from the Vein. As soon therefore as the Skin about the Orifice rises into a Tumour, it must presently be gently pressed by your left Thumb, that the violence of the running Blood may be mitigated and the rising Tumour depressed: then draw off your Thumb gently so far as till the Orifice appear, and you have room enough for the Lancet and the hand you hold it in: then put the Lancet gently and warily into the first Orifice, which make as wide as it ought to be. But in this operation we must take heed that the Skin alone (which is usual) be not widened without the Vein, for then both the pains and pain would be to no purpose. Put the Lancet therefore moderately into the capacity of the Vessel it self, and enlarge the Wound as much as is sufficient. If the efflux of the Blood be hindered from the recourse of the Skin, it is gently to be drawn back to the same place in which it was when the Vein was cut, that the division of it and of the Vein may hit together, and it is to be held there till the Blood have issued out as you desire.

Leon. Botal.
de 9. 11.

¶ But it happens also that the Skin, or rather all that which lies above the Vein, sometimes covers the orifice in the Vein, when yet the same was

was

was not removed out of its place : and that happens when the Surgeon thrusts his Launcet over slopingly into a vein that lies deep, and lifts not up its point, but draws it out again the same way he thrust it in : In this case, to make the Blood flow (if the Vein be cut wide enough) the Skin is to be raised up by putting a slender probe or the head of a pin under it, or the Vein is to be lightly depressed with the same probe or pin, till the Blood shall have flowed out to your liking ; for by this means the vein being thrust from the Skin or the Skin raised from the Vein, the Blood gains a passage.

Idem §. 12.

XCII. When a fillet is tyed about any member, and the Vein that uses to be found in that part, does not appear, but something that is round is felt deep under the Skin, of which you doubt whether it be a vein or not, presently loosen the fillet ; and if it be a Vein, it also growing lax will fall down and be no longer perceived by your finger till you bind the member again : but if when the fillet is loosened, that which you touched feels as it did before when it was tyed, then use not your Launcet, for it is not a Vein but a tendon, or the Head of a muscle, or something beside a Vein : And the Arteries beat where they are ; whereby both their situation and depth become manifest to even a meanly experienc'd Artift.

Idem §. 19.

XCIII. Patients often ask what Vein of the Arm they should have opened, because they have heard something of the distribution of the Veins in the Arm, one of which they allot to the Head, another to the Liver, a third they make doubtful, profitable to both the cavities, Belly and Head. Physicians introduced this opinion before Anatomy was so well cultivated as now it is, and many adhere to it still : But it is certain, seeing all the Veins of the Arm spring forth of the same Branch, that they evacuate from the same parts ; And that which is allotted to the Head empties no less from the Liver than that which is called *Basilica* ; though the *Cephalica*, because sometimes it receives a little Branch from the Head, is believed to profit more in the Diseases thereof : yet both do equally help the Diseases of the internal viscera, and do equally withdraw Blood out of the *Vena cava* ; and 'tis to no purpose to pitch upon one more than another, for they all draw Blood from the same fountain. Of this opinion are *Vesalius Anatom. l. 3. c. 8. Baubin in Theatro, Fallopius, Bartholin, Horstius tract. de Scorbuto*, and others. ¶ If the rule of late dogmata be consulted, the circular motion of the Blood takes away the choice of Veins : there is no prerogative of order amongst them, all the Veins enjoy a common fate. The Blood always ascends by the trunk of the *Vena cava*, and changes not its course upon the opening of the Veins of Arm or Foot ; but that which flows out, issues from that part of the opened Vein that is below the orifice that is made in it, and that Veins's twigs in the extremities of the Hands and Foot do again receive the Arterial Blood. Therefore the parts affected are not emptied directly : No fruit can directly be expected from the opening of a Vein in the Arm or Foot, viz. of the *Cephalica* in Diseases of the Head, though it be joyned by a particular Branch with the external Jugular : or of the *Basilica* in Diseases of the Breast, as the Pleurisie, though the same be joyned to the *Thoracica* in the Arm-pits. ¶ 'Tis all one which Vein you open, so it be plain : yet this caution should be used, That if the lower parts be ill, a lower Vein be opened ; if the upper, an upper : The Kidneys they otherwise place for the center of the Body as to its longitude, but this is better referr'd to the Heart : Bleeding on the same side with the part affected is better than on the opposite ; the cause lies in the Arteries, not in the Veins.

Primus de vulg. err. l. 4. c. 26.

Rolsine. c. 15. & l. de febr.

Walens. m. m. p. 80.

XCIV. Hippocrates §. aph. 68. propounds the opening of the fore-head Vein, but the Body is to be

diligently purged first, otherwise it may become hurtful, seeing it is a local Remedy. A man of thirty years old being troubled with a long Head-ach and Epileptick fits, by the advice of a Barbar suffered himself to be let Blood in that Branch of the Vein of the fore-head which in some bends a little to the left side, without any preceding preparation of the Body : But what came of it ? His eye in that very moment lost its motion, and became fixt, unmoveable and shut, an Inflammation arose in it, the pain in his head increased, and at length losing his speech he was with great difficulty recovered by the Physicians of *Basil.*

Hild. Cent. 5. obs. 18.

XCv. The *Ipsiadic* Vein, which is found in the outer ankle, ought not to be cut but with the strictest and fullest knowledge of the place, because of the Artery, Nerve and Tendon that lye near it.

Riolan. Enc. chir. p. 3. c. 3.

XCvi. The Jugular Vein is almost always opened in Cattel, as often as there is occasion for letting them Blood : 'tis strange that the same custom has not obtained in man, seeing this Vein is large and eminent, and may be cut the most easily and safely of all the Veins, because it has neither an Artery for its companion, nor any Nerve near it. Moreover by opening this Vein there is made an universal evacuation of the Blood out of all the Body, as well as by opening any other, and withal an excellent derivation of it from the Head, so that by it all stagnations or collections of the Blood and Serum in the Brain are remedied.

Willis.

XCvii. The Ancients opened the Jugular Veins in a desperate Quinsie which Remedy, though approved of many Moderns also is almost grown out of use in our times in that it is though dangerous because of the flux of Blood that can hardly be stanch'd because of the largeness of the Vessels. But experience has taught that this operation is not so dangerous if it be duly administred ; For first the Head of the Patient ought to lean on one side as much as may be, so that his chin may almost touch his shoulder ; then the Vein is to be opened without ligature with a small orifice lengthways of the Vessel (for so it closes more readily) and when you have taken as much Blood as you desire, by reducing the Head to its natural posture the Blood commonly stanches of its own accord : But to make the matter sure, *Galen's* plaster, made of Hare's wool, Aloes, Frankincense and the white of an Egg, is to be applied, and thereby the flux is certainly stoppt. Of its efficacy, See *Trallian. lib. 1. cap. 1. Zacut. prax. adm. l. 1. obs. 89.* and others.

Lazar. River. l. 6. c. 7. & l. 1. c. 2.

XCviii. Hippocrates opened the external Mammaries in inflammations and pains of the parts in the Breast : But seeing they are obscure, this operation is now grown out of use ; and instead thereof Leeches, or Cupping-glasses with Scarification may be applied.

Riolan. Enc. chir. p. 237.

XCix. Many Physicians advise to open the Veins of the Nose with a Launcet, and Leeches, but neither way is safe : for seeing they are not open to the sight, the Surgeon may easily mistake ; nor can the wound be so bound up as in the subcutaneous Veins : Nor is it safe to put Leeches into the Nostrils, seeing they may easily creep too far in and stick so obstinately, that they cannot be easily drawn out, and they may cause a great Hemorrhage. Instances are given by *H. Saxon. l. 1. Pract. c. 2. Sennert. Pract. l. 1. p. 1. c. 8.* See *Zacut. l. 1. hist. med. princ. 4.* where you have a story of a Leeches creeping up the Nostrils into the Brain, Yet in the year 1666. I saw Leeches applied to the Veins of the Nose with good success, in a young man ill of a phrensie. Let the Surgeon hold the tail by a course Linnen rag, and not let it go till the Leech be fasten'd, and so they may be used without danger : If there follow too great an Hemorrhage,

if

it is easily stanch'd by sprinkling astringent Powders upon it, &c. which apply to the extremities of the Noftrils, and not to the more inward parts.

¶ In the year 1674. the Jaundise was frequent amongst us: Some got themselves to be let Blood in the apex or tip of the Nose, the sooner to free their face from its full colour, which indeed I could not but laugh at at first sight, seeing it is unusual with us: Yet I found that *Galen* commends the opening of this Vein in a continual pain of the Head; and *Botallus* l. Cur. rat. per sang. miss. affirms, that he has often at the persuasion and instance of an Empirical Physician, made use of it in old Diseases of the Eyes, as also in long continuing pains of the Head; but that he has observ'd it more profitable in redness of the Nose than in the above said distempers. I have sometimes order'd it to be opened in the Jaundise, but with doubtful success; for those were as soon cured, and recovered their former colour that had it not open'd, as those that had.

C. Sometimes the Veins of the Nose are opened by a Lancet, and sometimes by Leeches, but I do not at all approve of this way. A Senator here at Padua once being ill of a burning Fever, had one Leech applied to his Noftrils, which crept up into his Head, and the miserable Patient died of a too great Bleeding which the Leech caus'd; for she could by no means be either killed or drawn out again: And I was very much troubled at it, having seen the same thing happen at Venice formerly. ¶ Great caution is to be used in applying of Leeches to the Noftrils, lest they taken upon some part that they should not. It happened at Rome in the year 1572. that a certain Surgeon would needs apply a Leech to one, which being supposed to have fasten'd on the inside of the Noftril penetrated a while after to the very coats of the Brain and staid there a long time, even till she had killed the man, those means that were made use of for drawing her forth doing no good.

¶ Yet by the help of this Remedy I saw a phrensie cured in the year 1666. in a Switzerland youth of about 14 years old. But in the application let these cautions be observ'd; first that the Leech being held in a course rag be not let go, till it appear that she has fasten'd firmly to the extremity of the Noftril; secondly, that the Noftril to which she is applied be squeezed together with our fingers, that she may be hindered from ascending or penetrating further.

CI. The opening of the *Vena poplitea*, usual heretofore, is now out of use, yet it might be conveniently opened if the Leg were plunged to above the Knee in a tub of hot water, and chafed, as is usual in opening of the Veins of the foot. 'Tis easie to find and safe to cut below the hollow of the ham, at the beginning of the *musculi Gemelli*.

CH. The Veins under the tongue, or *Raninae* are often opened with good success in Diseases of the fauces and Head. *Aurelianus* alone (l. i. acut. c. 12.) hath disapproved hereof, because the Head is filled hereby and the flux of Blood cannot be stoppt. 'Tis true that the Blood hath flow'd so plentifully in some, that it has been very difficult to stop it, as was observ'd in *P. Capucinus*. ¶ If Preachers be troubled with an Inflammation of the Tonsils, we ought not to open the *Raninae*, for stammering often follows upon it. ¶ A young man ill of a Quinsie died by opening the *Raninae*, because while the Blood flow'd largely and through carelessness he spit none out, he was choaked by it. We must therefore take heed that in such Venesection the Patient lye not straight along, but bend a little forwards; for now that the expulsive faculty is weak, even a little Blood falling upon the weazand may choak. ¶ The Veins under the tongue are to be opened lengthways, otherwise 'tis difficult to stanch the Blood.

¶ The Egyptians do so much confide in this phlebotomy, that they use it as a secret for any Inflammations of the Head, and distempers of the Eyes, for redness of the face, a phrensie with a Fever, want of sleep, acute Fevers, when on a Critical day Nature delayeth a Crisis by an Hemorrhage. *J. de Partibus* says that it is profitable also for Tertian Agues.

CIII. Many believe the opening of the *Salvatella* to be superstitious. Nevertheless *Hippocrates* opened the Veins of the Hand; and that Remedy has not been disapproved by learned men, especially in Chronical Diseases and the Quartan Ague, in the conjunction of the Sun and Moon: This I have seen to succeed happily, both to my self and others, in Chronical Quartans, after divers Remedies had been used in vain.

CIV. They commend the opening of the *Salvatella* in Diseases of the Spleen, of which *Adrian Spigelius* 5. Anat. cap. 7. gives this reason, because the fervor of the Spleen may thus be ventilated, and by the succession of Arteries the effervescent Blood may be somewhat securely evacuated: and so it is done by consent through the communication of the Arterial Blood, which poured forth together with the Venal because of the anastomoses of the Arteries that are near to the Vein that is opened: And seeing there are six times more Arteries in the Spleen than Veins, 'tis indeed very necessary that much benefit should accrue to the Diseases thereof, because the Blood is evacuated out of those Vessels in which it offended. But if the circulation of the Blood had been known to *Spigelius* (which he seems to have come near the knowledge of) it had been easie for him to have given a more certain reason; namely because in the extreme parts there is a greater number of Anastomoses of the Veins with the Arteries: Therefore the reason of the profitableness of such Blood-letting is to be drawn from the drawing out of the Arterial Blood, or of that which flows very near out of the Arteries.

CV. *Spigelius* did in himself and others open the Vein that runs betwixt the fore-finger and thumb for a stubborn Head-ach, and it proved a present Remedy, as is related by *Job. Rhodius* cent. 1. obs. 56.

CVI. And *Zacutus* (in prax. admir.) relates, that a woman who had been long troubled with an Head-ach had that Vein opened which runs by the corners of the eyes. This Vein becomes apparent by tying the Neck moderately, and under the Arm holes strongly. *Avicen* 4. in cap. 10. proposes the opening of it.

CVII. *Zacutus* (prax. admir. lib. 1.) applied ten or twelve Leeches round about the temples in a stubborn Head-ach, which proved a present Remedy. *Riverius* bids us note that he applied ten or twelve, that all the matter might be drawn forth, and not two or three.

Scarification.

Scarification.

The Contents.

- Scarification is a safe and effectual Remedy. I.
 It is good for all outward Pains. II.
 Scarification of the Ears is good for many things. III.
 Let it not be too deep in the hinder Part of the Head. IV.
 Scarification of the Ankles or Legs serves sometimes instead of Bleeding, but so do not Cupping-glasses with Scarification. V.
 When it is used instead of Bleeding, where to be made. VI.
 That upon the Ankles is dangerous. VII.
 Scarification is profitable in many cases. VIII.
 The unseasonable use of it is hurtful. IX.
 Being made too deep it caused a Palsie and Death. X.
 It is unjustly suspected of doing harm. XI.
 Scarification of the Loins does revell very much from the upper Parts. XII.
 The Instrument must not be too sharp. XIII.
 A Gangrene following upon Scarification. XIV.

I. **T**HE Ancients practis'd Scarification far more confidently and frequently than we now adays, who use it in no other cases but in a certain private application of Cupping-glasses, and in the cure of Gangrenes: namely because we are unskilful and slothful, and afraid of safe Remedies, and contract an Art that is rich and very full of help and Remedies, into a few and rare things; which nevertheless are slight and ineffectual: being always ready to alledge, that men in old Time were of a firm and strong Nature and able to bear great Remedies, but those of our time are all of them feeble and weak: So that most are afraid of making incision in the part affected, for fear of Attraction as they call it: but *Prosper Alpinus* (*lib. 2. de Med. Egypt.*) does readily refute these by the event which uses to be successful and void of any new defluxion upon the Part. *Seb. Travius* declares *Oribasius's* opinion of Scarification to be safe, if the fluxion be arrived at its state; though a fierce Fit should follow the said vigour of the Disease: And I can of my own knowledge testify, that having practis'd it in the publick Hospitals of the Incurables, I never knew any man that found it unprofitable or cryed out upon its unsuccesfulness.

II. I can upon mine own Experience testify, that Scarification is of wonderful efficacy to ease all Pains that have invaded the outer part of the Body: To relate a few of many, let that be the first, which I experienc'd in N. who being afflicted night and day for many Months together with Venereal Pains in his Leg, and could have ease by no Medicines, but was almost kill'd by them, had them wholly removed by the help of Scarification. 2. Let the second instance be N. who was trepann'd, and having a cruel Pain arising many days before about the *bre-gma*, was relieved by this Remedy. 3. By it I cured a great Pain in the *Perineum* in a Shoe-maker. 4. I cured also a Porter that was grievously pained hard by the soal of his Foot. 5. By the same Remedy I gave such Ease to a Jesuite that had had a continual pain in a Toe for many Months, and could be helped by no other Remedy, that the pain never returned again. 6. By this means I disscuss'd a pain in the *Perineum* in *Joseph N.* that was in very great danger of Apostemating. 7. One that was much pained in his Loins and made pitiful moan, received seasonable relief from this very thing.

Severin. med. eff. p. 78.

3. The Ancients make no mention of Scarifications in the Ears: *Is. Theod. Minadeus disput. 4. de Curabit. &c.* approves of them, and adds, that such

Scarifications are delectable to those who are mad-drunk with Wine, or who have their head loaded from any cause, first chafing the Ears with warm water, and then Scarifying their extremities outwardly, not very deeply or largely but slightly; yet so as may draw Blood from thence to an Ounce or a greater quantity; by which Remedy the pain in the Head remits, not so much through the evacuation that it makes, as through the consent of the pained part with the Head, seeing the pain either is the offspring of a too thin Blood; or has its rise from an hot exhalation. This benefit of this Remedy, is confirmed, says he, by all *Arabians*, *Cretians*, *Grecians*, who use to heat themselves with Wine even at this day. The Scarification of the Ears helps much in the acutest pains of the Teeth: yea if it be repeated, it may supply the place of venesection. Maids in some parts of Germany let their Ears be Scarified to make them more Beautiful, namely that their Face may look whiter through the evacuation of the Blood.

IV. Let not the Scarification in the hinder part of the Head be too deep. *Avicen* tells of one that fell into a Palsie of his Tongue upon applying a Cupping-glass with Scarification: namely the Scarification being too deep, pricked the branch of a Nerve that goes from the beginning of the spinal Marrow to the Tongue.

V. Many dare affirm that Cupping-glasses with Scarification supply the place of Venesection; whose opinion is erroneous and estranged from truth. For *Galen* speaks not a word of Cupping-glasses for taking away the plenitude of Bodies, as many of our Physicians think; but he mentions only Venesection and Scarification of the Legs: which is gathered from 2. *Aphor. Comment. 17.* The evacuation of all the Humours equally, which indeed is the most equisite, is made by Venesection: and the next to this is that which is made by Scarification of the Ankles. And in his Book of *Leeches*, Cupping-glasses and Scarification he has said, That in *Plethorick Bodies* Cupping-glasses are not only unprofitable, but hurtful. And in his Book of *Curing by Bleeding* he has taught, That before the application of Cupping-glasses the whole Body ought to be evacuated, and that those are to be applied either with Scarification, or without it. The same Person has said also *Lib. 2. Aph. & Lib. 4. de Sanit. tuend.* and in many other places very plainly, that Scarification of the Legs obtains the second place after Bleeding. And 13. *Method.* he has writ, If the Body be *Plethorick*, Blood is to be let either by opening a Vein, or Scarifying the Legs.

VI. 'Tis controverted concerning the place in which this Scarification is to be made: *Amatus* uses it in the Arms and Legs: The *Egyptians*, as *Alpinus* relates, make incision in the calf of the Leg with long and deep Scarifications, and draw Blood from thence very quickly and largely, first bruising and beating the Part, that it may lose all sense. *Galen* almost always mentions the Ankles, that is, the Parts nearest the Ankles: but how there can be an incision made in them with profit and safety, is hard to understand, because of the many and notable Nerves that are seated there: besides that they are dry and without Blood. I am of opinion that no certainty can be had of that matter, especially from *Galen*, who though he often make mention of the Ankles, yet he also propounds a Scarification of the Legs and Arms. But I thus conclude, both from the authority of *Galen* and of the foresaid Physicians, that this Scarification may be performed; as necessity requires, both in the Legs and Arms, and that both indeed contribute to the evacuation of the whole: but that by that in the Legs, the plenitude that arises from the suppression of the Terms and Hemorrhoids is evacuated; and by that in the Arms, the plenitude that arises without these causes.

VII. At Padua in my time there was so violent a flux of water from only two incisions of the Ankle, that a Woman died outright of it. Also when the Blood in which the heat is lodged, is evacuated, there sometimes succeeds a Gangrene.

Johan. Rhod.
Centur. 3.
Obf. 17.

VIII. The Egyptians use to Scarifie the Skin in very many Diseases: For in the most violent Pains, especially such as proceed from a plenitude, or a poisonous quality hurting the sensible Parts; in a fluxion that is somewhat fixt, after an universal both purging and evacuation, they use to Scarifie the pained Parts, or those next them, deeply, and to let a great deal of Blood run out: For in all Inflammations that continue long, they use deeply to Scarifie the inflamed Part, as the pained side in a Pleurisie, and the Breast in a Peripneumony, and the right Hypochondre when the Liver is inflamed, and the left, when the Spleen: and thus they are wont to do with other inflamed Parts, especially in great Erysipelas's, or any other inflamed Part, where there is fear it should degenerate, into a Gangrene or turn to a Scirrhus. They are wont most frequently in pains of the Gout, that arise from a defluxion of the Blood after universal evacuation, to Scarifie the swelled aking Toes; for part of the defluxed Blood being evacuated by that Scarification, it profits wonderfully. In like manner they use Scarification both in Tumours, and Ulcers that will not heal up: as also for all defedations of the Skin, spots and pustules: And no less do they deeply scarifie a Part wounded by a Scorpion, or bit by some wild Beast, and by that means they draw a great deal of Blood from the Part.

P. Alpinus
Med. Egypt.
c. 11. l. 3.

IX. A lusty man, of a good habit, having never had any Distemper of Body for Fifty years, used Scarification on his Back every Month, and let the Blood flow out even till he fainted: hereupon at length he fell into Catarhs, which possessing the Neck without any apparent Tumour brought a difficulty of swallowing both Meat and Drink, which Disease continued for a Month, and after a year returned again and choaked the Patient. Whence it appears that the importune use of Scarifications does great harm and causes cold Diseases.

O. Grembs
Arb. ru. &
int. p. 169.

X. Galen (1. ad Glaucen. c. 7.) makes a threefold manner of Scarification, a slight, deep and mean. When the Humours are thick, tough, compact, either in part, or in whole, the deep is necessary. An unwary Surgeon curing an abscess arisen from a thin Humour upon the spine of the Back, made so deep a Scarification, that cutting the Nerves he cured the man indeed of the Tumour, but made him Paralytick. Another made so deep an Incision with a sharp Razor, having no Launcet in readiness, that there follow'd an Hemorrhage which could never be stanch'd by any Remedies, no not by a Caustery it self, but the Patient died of it.

Zacut. prax.
admir. lib. 3.
Obf. 65.

idem Obf. 66.

XI. Scarification in general is very much suspected by some; whence also Grembs (in Arb. ru. & int. l. 3. c. 1. § 48) disallows of Scarification, pretending that a no small hindrance of long life is the bad custom of Venesection and Scarification, which hath so prevailed, that in some Families they use Scarifications once a Month, and Venesection twice a year, whereby they lavishly spend the treasure of life. But experience says the contrary, for some may be found of Sixty, yea, I have known some of Seventy, that even from their Childhood have used this Remedy without hurt. Nor is that true, That he who has once scarified, must necessarily continue it all his life long, unless he will precipitate himself into danger of his life: I knew one, says D. Mabius, that when he was a Boy of about Eight years old, being subject to frequent Ophthalmies and Fluxions upon his Eyes, by the advice of a

skillful Physician used Scarifications twice a Month till he was Ten years old with good Success: And when these Diseases ceased, he left off the Scarifications also without falling into any Disease, and is still alive, and healthful and sprightly.

Fr. Hofman.
m.m.l. c. 18.

XII. There arise a great many Veins from the Loins, which you cannot plainly see unless you cut the Skin from that Part: wherefore Scarifications of the Loins are very good to revell from the upper Parts; and in some Countreys those Veins are opened, if they appear to the Phlebotomist, if we will believe Platenus in his Anatomy.

Riolan. An-
thropogr. l. 2.
c. 6.

XIII. We must not make incision with too sharp a Launcet, which a Surgeon once doing in a Boy, thinking that by that means he should do it with the less Pain, caused a great Convulsion: for often either the Membranes under the Skin, or the Nerves are hurt: besides that the thick Blood is not evacuated thereby, but only the thin, as Hippocrates (lib. de Medico) teacheth, who for that reason bids us use Launcets that are crooked at the end, and not very narrow; yea sometimes serous and sanious Humours become viscid and thick, whence there is danger they should stay in the too narrow gashes. That the Scarification should be made by drawing the Knife along, and not by stabbing it in, Experience shews and Reason perswades.

Rubeus in
Celsum lib. 3.
c. 11.

XIV. 'Tis certain that in foul and Cacochemical Bodies there are often raised malignant Defluxions upon several Parts. I order'd dry Cupping-glasses to be applied to the Buttocks and Back of one infected with the Pox, for a cruel pain in his Head; which having done, one by the Loins grew into so great a bulk, that for the Tumour and great redness, he that made the Application was forced without my advice to Scarifie it: But he could never heal up the Ulcer, yea a virulent Humour flowing out by it, and Blisters full of black Blood being raised, there arose a Gangrene spreading deep upon the Spine, and thereupon Convulsions, all which brought the man to his end.

Zacut. Prax.
admir. l. 3.
Obf. 67.

Spleneticks.

The Contents.

- They respect either acid, serous Humours; I.
Or the acrimonious, saline lixivial; II.
Or the tartareous and viscid Phlegmatick sliminess of the Blood. III.
How Steel remedies profit the Hypochondriacal. IV.
They profit not all alike. I.
Volatils often hurt. V.
Acids are often beneficial. VI.
The Spleen requires strong Aperitives. VII.
How Steel remedies are to be used. VIII.

I. AS the Liver does more dispense the Sulphur of the Blood, so does the Spleen its salt and serum. Now Spleneticks and Hepaticks are good together, and they are commonly one and the same; hence likewise Aperitives chiefly belong hither. Spleneticks respect either I. acid, austere humours that fix the Blood, and induce Melancholy, Dullness, &c. such as are (1.) all aqueous diluting and mitigating Remedies, chiefly Nitrous, Medicinal Waters, Whey, which, besides their Salts, borrow the greatest part of their virtues from their watry Particles. (2.) Gentle aromatick and bitter things, ranked under Hepaticks. (3.) Fixt Lixivials, and volatil Alkali's: thus the Salt of Wormwood, of Centaury, the tincture of Tartar, Spirit of Sal Armoniack, Antiscorbutick Plants, &c. belong hither. For as those

those acid Humours concentrate and fix the Blood; so these very volatil, Saline and Sulphureous do set at liberty, subtilize, and volatilize it, so that from that Lye that it was reduc'd unto, it is again invigorated. (4.) *Earthy* Medicines, coming towards the nature of Alkali's, and Resolvents: Thus *Helmont* extols Crabs Eyes boiled in Wine and that have acquired a lixivial taste: Thus also *Glauber* affirms that the Powder of Corals does profit the Hypochondriacal only, because they absorb an acid: thus the filings of Steel, even taken in substance, profit. And hence also as good as all, and a *Panacea* of the Hypochondriacal are (5.) *Steel-remedies*, the reason of whose action is no other than that by absorbing they invert, saturate, sweeten and render profitable those acid Humours; No other wise than as *agua fortis*, and acid Spirits being poured on Steel grow sweet, their Particles being blunted and turning to Vitriol: These very Remedies are profitable on this account in Hypochondriack Melancholy, in Pains of the Hypochondres, Cachexie, the beginning of a Dropic, Scurvy, palpitation of the Heart, Swooning, &c. *Vitriolate* Remedies themselves belong hither also, both those which are originally such, and chiefly those which are regenerated of Steel, as *Vitriolum Martis*, &c. which after their manner do also absorb, strengthen and saturate also acid, pontick Humours.

II. Or 2. *Acrimonious*, saline lixivial humours, whether they be more eminent apart, or concur in Predominancy with acids. And such Remedies indeed, besides watry diluents (which are common as it were) consist of (1.) *Acids*, in regard they fix as it were the volatility of the serum, and are profitable in the too great Hemorrhagies of the Cachectick and Scorbutick, as by these means I have cured some that have been so affected. (2.) *Austere* Remedies, which do concentrate the same as it were and hinder a too great rarefaction, as the anti-phthical tincture of *Grammanus*, styptick Powders, &c. and they are good when the Serum is too fluxile, in colliquative Fluxes, immoderate Sweats, in which case there is sometimes place also for *Opiats*. (3.) *Earthy* things, inasmuch as these also absorb and precipitate, as has been explained elsewhere. Among Spleneticks *Ceterach*, or Spleenwort, &c. are good as in other cases, so in inflammations, anxieties and pains at the Stomach, &c. of the Hypochondriacal.

III. Or 3. the tartareous and viscid Phlegmatick sliminess of the Blood, immersed in a greater or lesser quantity of serum, such as are chiefly (1.) *Acids*: Whence it is not unreasonable to think that even mineral acid Spirits do sometimes much, if not all, in curing the Hypochondriacal affection; for they incide and attenuate mucilaginousness, especially the Spirit of Salt, &c. these also free the first ways from that notable mucilage, that lines the Stomach, which they carry either to the passages of Urine, or dispose to go out by stool. (2.) *Alkalines* and *Eniza*, which on this account are called Saponaries; these do notably carry away and absterge the Lees of the Blood, as *Helmont* speaks; the tincture of Tartar, the arcanum of the same, Tartar vitriolate, &c. (3.) *Aromaticks*, as others so especially carminative which use to profit both inwardly and outwardly in those cases; yea both the now mentioned things do so conspire as it were in this third vertue, that they procure a free course to the Blood, and that the Serum be not hindered in its office, whence also bitter things, and other belong hither: these also correct that dullness, and deficient spirituaence and aerecence of the Stomach, or rather of the chyle, and do especially avert *Scirrhus*'s of the Spleen, and are of principal efficacy in Quartan Agues and its Symptoms that arise from hence. For it cannot be, but when either the Blood is too much fixed by acids, or the oily, Balsamick particles of the Chyle are not separated, slimy, thick, tartareous

excrements must be bred, and be fasten'd here and there, but especially in the Spleen. (4.) Hither belong also *Abstergers*, *Diaretics*, and *Nephreticks* likewise; for it is certain, both that in the Hypochondriacal a gravelly sandy matter, that proceeds from the tartareous muddiness of the Blood, is separated with the Urine; and also that most who are troubled with the stone are Hypochondriacal withal, and that antihypochondriacks are proper for these also.

IV. From these things it is clear, both that any specifics in general, and in particular spleneticks and Antihypochondriacks, are not all of them proper for all Persons: for like as either austere and acid Humours, or Lixivial, Volatil, and middle (such as chiefly cause colliquative sweats) or the muddiness of the Blood offend more, so likewise doth the application of these vary; so as that if a man proceed in order, and apply them promiscuously, he shall rather load the Patient with Symptoms than relieve him.

V. Volatils, as well others, as Antiscorbutick, do often hurt the Splenetick, and even the Scorbutick themselves. This is clear from what has been just now alledged; for if the Hypochondriack person have a Blood that is full of Saline, Lixivious and Alkaline atoms; if he be troubled or abound with an over fluxil and volatil Serum; those thing indeed are not good: whence 'tis an error to administer Antiscorbuticks indifferently. Hence I have often seen all the Symptoms that were hardly allayed, as preternatural heat, watchings, &c. raised anew by the Spirit of Scurvigrafs, which had also been used hand over head for the extracting of other Aperitives, for instance of Steel.

VI. *Acids* are often good, and so it cannot be said simply, He is hypochondriacal, therefore no acids are to be given him. Hither belongs *Lippus*'s Encomium of the Spirit of Vitriol (*Cent. 1. Epist. 81.*) for when through a sedentary life he had contracted a great sliminess of Blood; whence also he voided by Stool glassie Phlegm, he used the Vinegar of Vitriol with no bad success. Likewise temperate, and absorbing, and diluting Remedies are profitably administered to these: Hence *Servius* (*Inst. Med. 6. 3.*) I have sometimes benefited the Hypochondriacal rather by cooling than healing Medicines, by Whey, Mineral Waters, and other things whereby the heat of the Hypochondres might be temper'd: and so neither are these things to be administered without the active, nor those without these temperate Remedies. The Serum is to be attended to in all cases, that it be neither defective nor abound too much with saline Particles.

VII. But the Spleen requires stronger Aperitives than the Liver: This is the affirmation of *Galen*, which though *Mercatus* oppugn, and grant it only of the external use; yet it is true where either the Spirits and Blood are fixed; or sliminess is Predominant in the Blood: hence for instance the Spirit of Sal Armoniack is very profitably given to the melancholick even in drink.

VIII. Those must use motion that take Steel Remedies, and the Excrements of the Belly are to be considered: Motion I say must be used, that the sluggish Humours may be excited, and the Medicine may be better actuated and descend; but this is principally to be meant when they are taken in a dry or solid form, for then, unless motion be used, they do not work well: And the Excrements must be consider'd, because they are tinged by Steel-Medicines, so that they are voided black, because of the Vitriol that is drawn out of the Medecins, which is a manifest token that there has been a resolution thereof made. And it is to be noted, that they are not to be given (in substance and a dry

G. W. We- dry form) except the Stomach be strong, so that, if I may so say, it can bear and concoct them.

Stillicidium, or Pumping.

The Contents.

- It is a very effectual Topick. I.
We must have regard to such Indications as forbid it. II.
To whom hot Baths are hurtful. III.
How cold Stillicidia are to be used. IV.
To what Parts they are chiefly beneficial. V.
What Part of the Head is to be exposed to them. VI.
The manner of administering them. VII.
The Patient must not sleep the whilst. VIII.
What things are to be applied afterwards. IX.

I. **Stillicidium**, or Pumping, commonly called *Daccia* and *Gutta* (and improperly by some *Embroche*, which signifies Perfusion, from *ἐμβρῆχω*, to wet) is that form of Medicine, whereby there is made a distillation of a liquid Humour from on high like a shower upon some part. It is agreed by all that this *Stillicidium* excels any other form of external Medicine, as to its activity, and that indeed justly, because through the motion of the matter falling from on high, the Skin waxes hot and the Pores are opened, whereby is made the greater impression. The occasion of inventing this Remedy was twofold; the one the resistance of the Distemper as to other forms and manners of acting, through the stubbornness of the matter, or its too deep situation; the other, the disposition of the Part it self to which the Remedy was to be applied, when through the obstacle of the Bones it suffers not the virtue of a Medicine to reach to the part affected, unless it be administered with motion; on which account *Galen* (13. *Meth. c. 22.*) commends this manner of administration chiefly in the Head.

II. The Prohibents are many, and 1. a *Plethora* and *Cacochymie*. 2. An Ulcer and all solution of unity, yea and sometimes an evil composition of the Parts: But it is particularly forbid for the Head by a vertiginous Distemper, by a suffocating Catarrh, or an hot Catarrh; because seeing upon the account of this it ought to be cooling, it might do a great deal of harm to the Brain that is naturally cold: To which may be added that an agitation being made by such Remedy in the Head, an hot Catarrh, that is fluxile of its own nature, will fall more precipitantly upon the subjacent Parts, and thereby will cause great mischief.

III. Concerning waters that spring of their own accord it is to be noted, that the sulphureous, bituminous and aluminous (as *Galen* says 1. 6. *de tu. Valer. c. 9.*) are very bad for hot Heads, whether the heat be joined with driness, or with moisture; I say the sulphureous and bituminous, because they incend and melt the Humours; and the aluminous, because they conflate the narrow Pores.

IV. This also is to be noted, that such things are very seldom used in the way of *Stillicidium*, which by moistening may cool; yea this is to be understood of cold things in general, though they do not moisten but dry, as cold *thermæ* (or Baths) that they are never to be used alone, lest the innate heat be extinguished, but hot are always to be mixed with them at least in a threefold proportion.

V. *Stillicidia* are used to all places that are fit to have liquor fall upon them, but they are chiefly convenient for the Head, and for the Nervous Parts and Joints: The Liver, Spleen, Stomach, &c. see-

ing they are soft Parts, and therefore other forms of Remedies may easily work upon them, are not to be troubled with *Stillicidia*, save in a stubborn and inveterate Distemper.

VI. As to the Head, some distinguish certain Parts in it; for in a cold and moist Catarrh, Deafness, &c. they apply *Stillicidia* to the coronal suture; in a Palsie and Convulsion, to the hinder Part of the Head, where the beginning of the Nerves is, but whilst the Fluxion lasts, (for otherwise they use to water the resolved or contracted Parts themselves.) In other inveterate Diseases of the Head, such as the Head-ach or Megrim, they pour the liquor upon the affected or weak part it self. Indeed in my opinion these do not do amiss; but yet the virtue of the *Stillicidium* is always more easily and readily received by the coronal suture. In deafness the *Stillicidium* may be received very well in the region of the ears and temples: for if a mans skull be inspected, the Lambdoidal suture appears to reach even to the *Mastoides* process; and the sutures of the Temples appear to coincide therewith, so that the virtue of the *Stillicidia* may penetrate and enter into the inmost Parts of the Ears.

VII. It is administered two ways; the one without a Bath and separately from it; the other with a Bath, so as that the Patient ducking himself in a Bath, does withal receive the *Stillicidium*. The first way are almost all Artificial *Stillicidia* administered; and some of late think that Bath *Stillicidia* are best administered the same way: but besides that it seems too troublesome, Experience witnesseth that it is not so profitable.

VIII. Whilst the *Stillicidium* is administering the Patient must by no means Sleep, which he uses to be prone to when his Head waxes hot, and so a multitude of vapours is attracted to the Brain. But those do amiss who keep their Patients awake with loud singing, seeing the Head is filled therewith: Therefore we must endeavour to do it by talking to them, and by other ways.

IX. When the Embrochation is over, the part is to be dried and wiped with pretty warm Cloaths; and is either to be anointed with some oil of the same virtue with the *Stillicidium*, or to be fenced with something else that may preserve the quality imprinted by the *Stillicidium*. The vulgar apply a Linen cloth to the shaved part of the Head, and put a Night-cap over that: 'Twere better to apply a Cerecloth that is fitted to the Nature and Faculties of the *Stillicidium*: thus *Montagnana's* Capital Cerecloth, of Betony, &c. will be convenient for a cold Head.

Stomachicks.

(See Book 18. Of the Diseases of the Ventricle in general.)

The Contents.

- They respect either the heat; I.
Or the ferment of the Stomach. II.
Remedies strengthening the Ferment. III.
Correctors of it when it exceeds. IV.
What such Externals must be. V.
Such as respect the heat and ferment both, are very well joined together. VI.
What Stomachicks are bad for an hot and dry intemperature. VII.
In altering we must have a care we do not hurt the other viscera. VIII.
It is not to be overcharged with abundance of Medicines. IX.

I. Stomachicks

I. Stomachicks respect 1. the *heat* which is impaired and wants to be strengthened, of which sort are divers Restoratives indeed, yet they profit on this general account, that they are endued with an oily, volatil, aromack and sweet Sulphur which they contain, and are (1.) *Aromack* as *aromata* (or spices) the root of Burnet, Mint, &c. (2.) *Balsamick* oils, as Amber, Balsam of Peru, &c. for this very Medicine is indued with a Balsamick Acrimony, whence *Riverius* commends it in Vomiting, want of appetite, &c. (3.) Things indued with a *Volatil Salt*, especially such as is oily, as Pepper, Mustard, Ginger. (4.) *Spirituos* things, as wine, the Spirit of Wine, Mint, Juniper, Citron pill, &c. (5.) *Bitter* things, as Worm-wood, Aloes, *Elixir proprietatis*. (6.) *Carminatives*. (7.) *Mild Astringents*, as Cinnamon, Mastic, Peptick Powders, &c. (8.) *Nervine Cephalicks*, as Castor, Hore-hound, for there is a very great content of the Stomach with the Brain. All these things profit in an Anoréxie, injur'd chylication, belching, hiccough, pain at the Stomach, (in which case the oyl of Cloves and Carminatives are the most profitable) weak concoction, inflation, sympathy vertigo, and other Symptoms of the Stomach that arise from coldness: and generally the same things correct an *excessive heat* as correct a vitious ferment.

II. Or 2. they respect the *ferment*, which I call the *menstruum* of the Stomach. Now though those Remedies that contribute towards the restoring of this, do much agree and fall in with the aforesaid things, inasmuch as they also are indued with a saline Acrimony; yet this is to be noted by the way, That as those things which abound with a sulphureous Principle and are more Balsamick and oily, do more respect the weak heat of the Stomach and invigorate it; so saline Medicines do more invigorate the ferment: for there are some cases wherein the heat is strong enough, and yet the ferment hindered and fetter'd, so that concoction cannot be happily performed; though it be best that these fellow-causes, which stand for one, should be both attended together: and on this account we must also see that whilst we endeavour to strengthen the heat, we do not destroy the ferment, which is chiefly done by spirituuous things, as Brandy.

III. The sluggish and deficient ferment is whetted and recruited by all such things as are indued either with an acid Salt, or especially a volatil: 1. All *Acrimonious* things, as common Salt, which contributes indeed to the relish, but serves chiefly for a *stimulus* to the ferment, also pepper'd things, Antiscorbutick plants, the root of Aron, the Mustard of the Italians, &c. These things correct an acid crudity, and attenuate viscid phlegmatick Humours. 2. *Acids*, as Vinegar, which being used moderately profits both in drink and fomentation, Spirit of Vitriol, simple, and that of Copper, which Chymists call *sal esurinum*, the Spirit of Salt: some not unadvisedly reduce the ferment we make Bread withal into pills, and give it for helping the ferment of the Stomach: these things correct a nidorous and phlegmatick crudity. 3. Hither refer the coats of an Hens gizzard; but hardly any constant help is to be expected therefrom, unless perchance by accident, inasmuch as they withal absorb the bilious Humours that pervert the ferment.

IV. When the ferment exceeds in an Acrimony either saline, or bilious, (whither an hot intemperies also belongs) it is corrected 1. both by *blunting* of it, as *fat* things do, in the *boulimus*, or Dogs appetite; and also by *diluting* it, as watry things do; and likewise by *absorbing* it, as *Lixives* and earthy precipitants, which are called Alkali's, do, such as are Crabs-eyes and testaceous Medicines. Where note that these very things may also by accident, by restraining as it were and reducing into order chiefly an acid Humour, exceeding in the Stomach,

sometimes raise and reduce the appetite, whether alone, or mixt with acids, as for example the *tragea Stomachica* of *Quercetani* or *Birckman*. Thus I have very often observed that precipitating Powders, viz. such as have been prepared of shells only with native Cinnabar, have raised an appetite. For regard is to be had both to the proportion of the Acrimony that exerts it self in the Stomach preternaturally; (for the ferment of the Stomach is not as it should be, if it be excessively acid) and also to the continuation of the use, for all Lixives and Alkali's otherwise destroy the appetite and enervate the ferment, whence in the *boulimus* the oyl of Tartar per deliquium is a secret. Thus 2. the ferment is perverted (1.) by *sweet* things, because by their mucilage they obfuscate and blunt its saline Acrimony: (2.) *Acid Salts*, as for instance, it has been observed that *arcum Tartari*, that is otherwise a very famed Medicine, has by being too much used cast down the appetite: (3.) All *nitrous* things, inasmuch as they both dissolve the heat and the saline *menstruum*; whence in the continual use of Nitrous things we must see that they cause no disturbance in the Body: (4.) *Saturnine* or Lead-Medicines, especially the sweet and earthy; whence in the use of *saccharum Saturni* and the preparations thereof we must have a care we hurt not the Stomach: (5.) Strong *irritous Lixives*, as the Spirit of sal Armoniack. 3. and lastly, the ferment is fixed and obdured by Opiats, which are not good for the Stomach as such; and unless the ferment prevail, Vomiting is apt to follow the next morning, and by the use of Opiats the appetite is cast down: For as the Stomach rejoices in a Balsamick concocted and pure sulphur; so it is prejudic'd by such as is immature, impure and ungrateful. But these things that have been rehearsed, are good in all excessive Acrimony, whether it be with a *diarrhoea* or *cholera*, as also in a *Cardialgia* or pain at the Stomach, where besides Carminatives, oleous and the more temperate anodyne Medicines are required; they are good also in the hiccough, heat of the Stomach or *soda*, &c.

V. External Stomachicks ought to be 1. *Acid*, as fowr leven, vinegar; 2. *Aromatics* so called, with Wine, whether in the form of a Plaster or Cataplasm: and they are chiefly resolvents and revellents, as in an hiccough, Vomiting; likewise Carminatives: Earthy things are not so profitable.

VI. Note that it is very good so to joyn and dispose Stomachicks, that respect may be had both to the ferment and heat, which is done by mixing both sorts together: thus the sweet Spirit of Salt, and thus *Elixir proprietatis* macerated with the Spirit of Sulphur is good.

VII. In an hot and dry *intemperies* acids are to be avoided, and things void of acrimony are to be used; powders also are to be avoided, unless they be very much diluted, for otherwise they stick to the Stomach: but mucilaginous things are good: Hence the Spirits of Vitriol or Salt do cause a burning in the Stomach, by spoiling it of its native fermental viscosness, whence an erosion of it is apt to follow. This happens chiefly in the cholerick, and such as have first too much distended its Coats with drinking of Wine; whence the acrimony is more intimately insinuated into its unfolded plaits.

VIII. In altering the Stomach we must have a care we hurt not the other *viscera*, whether we use inward or outward Remedies; and especially that we hurt not the Liver which lies next to the Stomach; which we shall do, if we exceed the bounds of mediocrity.

IX. The Stomach is not to be overwhelmed with plenty of any sorts of Medicines, whether such as are design'd for it self, or with others; for as it receives the first benefit therefrom, so also does it the first prejudice. Thus in a certain Bi-

Gr. W. We-
del. de G. m.
t. c. p. 57.

shop was found the magisterie of Perles; in others, other things.

X. As in all Medicines, though destin'd for other Parts and Diseases, we must have respect to the Stomach how it bears them and is affected by them: so does that hold and is to be understood principally of Salts. Indeed amongst Stomachicks *Lixivial Salts* are also commended and prescribed, as for instance, the Salts of Wormwood and Juniper enter the Stomachick powder of *Birkman*, and sometimes the same have place in the weaknesse of the Stomach, but rather and almost only in case the ferment be tainted with a preternatural acrimony, and then they must be used with other Aromatics: For by the confession of all, this ferment is Saline; and if it be asked to what class of Salts it is to be referred, it is deservedly referred to that of acids, for it is somewhat acid in its farewel, as we say: yet it follows not from thence that every sort, be it never so fix'd and excessive, helps the action of the Stomach, but rather there arises from it a taint or crudity, and the chyme grows not Spirituous: And though sometimes when it exceeds with too great an acrimony, it encrease the appetite; yet it is vitious, and the particles are not rightly parted from one another thereby: whence in this very case, in the *appetentia canina* and *boulimus*, they profit more than any thing else: Thus I once cured an Hypochondriacal Person, that could not be satisfi'd with eating, with the Oyl of Tartar *per deliquium*. And the middle Salts do incide indeed and resolve, but injure the tone of the Stomach if used too long and too plentifully: whence Tartar Vitriolate, and *arcum tartari* being taken long and in a large quantity, hurt the same at length: By which experiment we plainly see 1. that neither lixivial nor middle Salts are to be used longer or in a larger quantity than is fitting; 2. We may gather from hence that the ferment of the Stomach is not acido saline in that sense, as if it were of the nature of acid Salts; but rather that it is Saline, and amongst Salts may be referred to the acid, though it be not so in its own Nature in the abstract. But acid Salts, though they come generally under another notion, are, as such, grateful to the Stomach: hence *acidum Tartari* comforts and strengthens the Stomach; and hence also acid Spirits serve the same end very well: But when acid Salts are modified by other accessories, they do not do so well; whence Alum and Vitriol rather hurt than help the Stomach, because of the Mineral metallick Parts that are joyned to them.

Idem phar-
mac. p. 184.

Sudorificks.

(See before, *Alexipharmacks*, *Diaphoreticks*.)

The Contents.

They agree in vertue with Cardiacs. I. Their difference as to their matter and faculties. II. The efficacy of a Sudorifick Diet, and where it has place. III. Sudorificks are not profitable for every Humour without distinction. IV. Lean Persons induce sweating well. V. What Humours may be expelled by sweating. VI. Wherein the vertue of some Sudorificks consists. VII. They are hurtful for some. VIII. Sweat is not to be provoked before the Humours are disposed. IX. We must but Sweat once a day, and that in the Mornings. X. We must Sweat several times, and not once for all. XI.

Sweat is not to be provoked in acute Diseases. XII. All are not to be compelled to Sweat. XIII. Sweating is not to be continued too long. XIV. Though Sweat burst not forth all of a sudden, yet it may come by degrees. XV. Absterion provokes it. XVI. Their efficacy to restore motion to the stagnating Blood. XVII. Hot drink taken whilst one is a Sweating promotes the Sweat. XVIII. Bezoardicum minerale is an effectual Hydrotick. XIX. Antimonium Diaphoreticum is but a weak Medicine. XX. It ought to be newly prepared when used. XXI. Those that are in the use of a Guaiacum Diet-drink, are to be purged every eighth day. XXII. How Sudorifick Decoctions make People fat. XXIII. 'Tis not good to give a bolus of Turpentine with them. XXIV. Salts are Hydroticks. XXV. The vertue of Decoctions depends on the Diet that is ordered in the use of them. XXVI. How the Decoction of Guaiacum is to be prepared. XXVII. The first Decoction draws not all its vertue forth. XXVIII. China and Guaiacum are not to be mixt together. XXIX. A strict Diet is not necessary in the use of a Decoction of China. XXX. Sassafras affects the Head too much. XXXI. Carduus bened. is to be given in substance. XXXII. The opening Roots are sparingly to be added to Hydroticks. XXXIII. When an Hydrotick Medicine being taken provokes not Sweat, it is not therefore hurtful. XXXIV.

I. *Hydrotick* Medicines, as to their ways of working, and Operations, have great affinity with most Cardiacs, commonly so called, inasmuch that many of both kinds are of a common or reciprocal use: and seeing they differ chiefly only as to their greater or lesser efficacy, when we are bound to pass from one *genus* to the other, generally we need only increase or lessen the dose, and chuse the fittest times for administering of them.

II. As to the various both kind and preparation of the matter, of which hydrotick Medicines are made; they are generally either the integral or elementary parts of some mixt Body: namely either natural Concretes are given in their whole substance, either simple or extracted, as when the Leaves, Roots or Seeds of *Carduus*, *Contrayerva*, *Angelica* or the like are taken in Powder, Decoction, Conserve or Magisterie: Or Diaphoreticks consist of the Particles of this or that element; namely spirituous, Sulphureous or Saline, either simple, or some prevailing over other; as if a Salt, Spirit, or oyl be extracted from *Carduus*, or other vegetable, mineral or animal Body, and be reduced into the form of a Medicine either by it self, or with other Preparations. We will briefly run over all, or at least the chief species of them. 1. Diaphoreticks, whose vertue consists in the integral Particles of the whole concrete, being unequally mixt, seem to be indued with some one element more eminent than the rest (*viz.* a Saline) and to owe their vertue chiefly to it. Now that Salt, upon which the hydrotick vertue depends, comes under a double state; for in some Concretes it is volatil and acrimonious or bitter, and in others Alkalizate and fixt in a fort. (1.) In the former rank are most Vegetables esteemed Antidotes by the Ancients, such as are the leaves of *Scordium*, *Carduus*, *Scabious*, *Perwinkle*, the flowers of *Marigold*, *Chamomel*, the roots of *Burdock*, *Zedoary*, *Galangal*, &c. Also the confecti- ons of *Mithridate*, *Treacle*, *Diascordium*, the decoctions of *Guaiacum*, *Box*, and the like, are reckoned among

Willis phar-
mac. rat. p.
m. 194.

among these: which kind of Medicines being taken into, and dissolved in the Stomach, make a tincture, whose particles, as being more hot and foreign, excite the animal Spirits, whence the *præcordia* being more briskly agitated do drive the Blood more rapidly about: yea they enter into & ferment the Blood that is in the Stomach-vessels, and so whilst they make it to be carried back more hastily by the Veins towards the Heart, they make it also to be driven more vehemently, even so as to cause sweat, by the Arteries into the habit of the Body. (2.) The other sort of Diaphoreticks, which whilst they consist of the Integral parts of the Mixt, have an Alkali Salt predominant, are Stones, and the Bony or Shelly parts of Animals and Vegetables, as Bezoar, Pearls, the Eyes and Claws of Crabs, and the like, whose Diaphoretick virtue proceeds chiefly from an Alkali Salt, inasmuch namely as the particles hereof sometimes meeting with an acid Salt both in the *viscera* and Blood, and effervescing therewith, thereby cause the mass of Blood to be fused, and its serosities to be separated and resolved into sweat. 2. Hydrotick Medicines which after a spagirical analysis owe their virtue to these or those elementary particles, being framed out of divers subjects and with a different preparation, are chiefly either Spirituous or Saline, or both together combined one with another, or with some Sulphureous particles. For such as are wholly or for the greatest part Sulphureous, are less accommodate to this intention, because such being generally offensive to the *viscera* do often cause a nausea and sometimes a Vomiting: Moreover those which through plenty of Sulphur are oily and fat, do not so readily insinuate their Particles into the mass of Blood. After what manner, and by what affection of the Blood or Spirits this second sort do move a Diaphoresis, we will inquire particularly: And (1.) to the Spirituous we refer hot waters and all sorts of Liquors endued with a vinous Spirit, such as are commonly distilled by Chymistry out of the fruits or juices of Vegetables matured by fermentation or resolved by putrefaction, as the Spirits of Wine, of the berries of Juniper and Elder, of black Cherries, &c. Such vinous Liquors as these being taken inwardly, both inasmuch as they erect the Animal Spirits and excite them into a greater expansion, and also in that they exagitate the Blood, and (as by the addition of oil to a flame) cause it to be more accended, do procure a diaphoresis. (2.) For procuring a diaphoresis Saline preparations of divers kinds and different states are prescribed with success; which yet do not, like the Particles of an intire mixt, or like the merely spirituous, either by their heterogeneity exagitate the Blood, or by their inflammability accend it, but only by acting upon its Saline Particles, which whilst they snatch into their embraces, they pull them from their too strict combination with others, whereby the compages of the Blood being loosened and the Pulse increased, the superfluous serosities and other recrements may the easilier part therefrom and be sent off by Sweat. To this rank ought Salts of almost every condition, but especially the volatil fluid, fixt and nitrous, to be referred, of which either alone, or compounded with one another, are the Diaphoreticks of the chiefest note made, which being taken inwardly, and meeting with other Salts that are as well in the *viscera* as in the mass of Blood, and calling them out of the embraces of other Particles, do unlock and rarefie the Blood, and thereby dispose to a Diaphoresis.

1. The Diaphoreticks whose bases are the integral Parts of a mixt, wherein likewise an acrimonious or volatil Salt is predominant, do often on this account contribute to the procuring of Sweat, inasmuch as their Particles being received into the Blood, seeing they can neither be mixt therewith nor tamed, do exagitate, greatly divide and part

as it were into small Particles the mass thereof, so that at length the compages of the Blood being very much loosened and wrought into an effervescence, the superfluous serosities, and the recrements and corrupted particles of the Blood are cast forth together with the particles of the Medicine that are to be thrown off because of their heterogeneity. 2. Sudorifick Medicines prepared of the elementary parts of a Mixt, have for their basis either a Spirit or Salt, sometimes simple, sometimes combined with another Salt, or with Sulphur. To Diaphoreticks whose bases are Spirits with other elementary particles combined (as for example, a drachm of *mixture simplex* in a convenient vehicle) are referred those which consist of a Spirit, a fixt Salt, or Sulphur combined; of which sort are the tincture of the salt of Tartar and Antimony, the dose whereof is from one scruple to two in some liquor: Moreover distilled waters, wherein the spirituous particles are diluted with the watry, use to be often given with success for provoking sweat. The doses of the aforesaid waters may be actuated by the addition of Chymical liquors of Salts. Medicines of this sort being endued with a vinous Spirit, are chiefly and almost solely profitable for old men, and for such as are endued with a cold temperament, or are subject to the Palsie or Dropsie: But in an hot constitution, and where there is an heat of the *viscera*, or a febrile effervescence of the Blood, they use to do more harm than good, inasmuch as they rarefie the former and accend this latter too much. The Diaphoreticks, which have a saline basis as they are of a various nature (*viz.* accordingly as it is a volatil, fixt, acetous or nitrous Salt) so they are of a different use and operation: whence in some cases one sort is better, and in others another or another. A fixt and volatil Salt are best for those whose Blood is very full of a serous Humour: Besides, if the liquor that waters the *viscera* and *genus nervosum* do at any time wax eager, as it uses to do in the Dropical and Cacochemical, and those who are subject to spasmodick Diseases, these Medicines are more profitably administered for procuring sweat: for meeting with the acido-saline particles of the Humours and closing with them, they unlock the compages of the Blood, and also through the heterogeneous mixture do exagitate its mass, so that its serosities are more easily separated and driven outwards through the pores of the Skin. 3. Diaphoreticks which have a nitrous salt for their basis, seem to help in the same cases almost as the former consisting of a fixt and volatil Salt, namely inasmuch as they destroy the predominancies of an acid Salt, and so dispose the mixture of the Blood, that while it effervesces, its serum and recrements may be the more easily separated and sent off. 4. Diaphoreticks whose basis is an acid Salt, are chiefly profitable against the predominancies of a fixt Salt or Sulphur. Namely if at any time through the saline fixt particles combined with the Sulphureous or earthy, the mass of Blood become too much locked up and constringed, so that it cannot easily let go its serosities to be sent off by sweat (as sometimes is usual in continual Fevers and the Scurvy) an acid Salt in the Medicine that is given meeting with a fixed Salt in our Body, and snatching it into its embraces, takes away the undue combinations thereof, and so unlocks the effervescent Blood, and disposes it to sweat. 5. Some Medicines that are wholly, or for the greatest part Sulphureous, are commonly reckoned in the number of Diaphoreticks, as namely some natural Balsams, and some factitious ones, also chymical oils, especially those of *Guaiacum*, Box, Camphor, Harts-horn and Soot; likewise the resinous extracts of heavy woods, with many others, which though of themselves they make little towards the provoking of sweat, yet being joined with other saline things I think

Willis
Pharm. rat.
p. m. 196. &
seq.

think them to be not altogether unprofitable, inas-
much as in a colder and too Phlegmatick a constitu-
tion, Sulphureo saline Remedies do rarefie the over
watry Blood and dispose it to a freer evaporation
no less than spirituous things.

III. The bases of a *Sudorifick Diet-drink* are the
decoctions of liquors for the cure of the Pox and
some other chronical Diseases deeply rooted in the
Blood and Humours. For a very intense and fre-
quent sweating (namely daily for a long time) is
requisite for the cure of some Diseases, namely not
only that the impurities and corruptions of the *vis-
cera* and Humours may be carried off, but also that
the morbidick tinctures that are deeply imprinted
thereupon may be wholly destroyed and rooted
out as it were. For this purpose it will not be
enough to give some sudorifick powder or *bolus* now
and then, but an intire Diet ought to be ordered
for this intention: wherefore let all the Drink be
a sudorifick decoction, after one dose whereof taken
also in the morning let plentiful sweating be
provoked, making use besides of the heat of a bath
or hot-House. Moreover seeing by this means
both the pores of the Skin are unlockt, and Nature
also is inclined to a Diaphoresis, all the day after
the recrements of the Blood, and nervous juice
will evaporate by perspiration continued all along
by the use of the same drink. By this method not
only is the French-Pox safely, and for the most
part very certainly cured, but also some other
stubborn Herculean Diseases are sometimes happily
Remedied.

Idem ibid.
p. 202.

IV. A watry and inspid Humour, being easie to
move, may be expelled by any sudorifick: but a
glutinous Humour only by those which withal have
a vertue to incide and attenuate such an Humour. A
salt muriatick, and acid or sour Humour yields chiefly
to volatil Salts, & uses to follow their motion to the
surface of the Body. So that, as I said before of
Vomits, so I ought to say now of Sudorificks also,
that they are diverse according to the Humour which they
carry forth: Which I cannot sufficiently admire that
it has been observed by none hitherto. Amongst
Sudorificks are commonly reckoned the roots of Smal-
lage, Burdock, Angelica, Fennil, Burnet, Zedoary, Gentian,
Contrayerva, Masterwort, &c. all which being Aromat-
ick have hitherto been thought to move sweat in-
asmuch as they incide a Phlegmatick, glutinous Humour
and make it moveable, and withal drive it forward
every way, and so to the pores of the Skin also:
moreover the same roots, of which some are bitter,
others otherwise Acrimonious, do temper and correct
more or less an acid, or sour Humour also, as
likewise a Salt muriatick, and so likewise do promote
sweat which in many Diseases is hindered by them.
Hither ought to be referred the leaves of Card. Be-
ned. and its Seed, Maiden-hair, Scabious, the flowers of
red Poppy, of Elder, Chamomel, Centaury, &c. as also
the wood of Guaiacum, Sassafras, Juniper, Oak, Box,
&c. which all help in like manner, in regard they
either cut rough Phlegm, or alter and correct acid,
sour Humours and the salt muriatick. Hither ought
to be referred all the volatil Salts of Harts-horn, Urine,
sal Armoniack, Bones, Blood, Hoofs, Horns, as performing
the same thing, and helping every way. More-
over the Bezoar stone both Oriental and Occidental, do
infringe and concentrate an Acid; the same is also re-
ported of the stone found in a mans Gall-Bladder: The
like is to be said of Crabs-eyes, Corals, Pearls, shells and
the like, which being used when an Acid offends,
do often provoke sweat. This is true in a special
manner of Opium, which is chiefly in cause that all
Opiats provoke sweat; Opium namely by its bitter-
ness does incide Phlegm, temper acid, sour and Salt Hu-
mours, and so also causes sweat. Terra sigillata con-
tains in it that which tempers all sorts of Acrimony,
on which account also it seems to promote sweat-
ing. Antimonium Diaphoreticum and Bezoardicum Mine-
rale, in regard it is rendred fixt, and indeed by

Sylv. de le
Boe m. m. l. i.
c. 11. §. 8. &c.

reason of its Sulphur, does temper every thing that
is acrimonious and reduces it to mediocrity, and so
also promotes the driving forth of sweat. Mercurius
precipitatus Diaphoreticus, made of sublimate corrosive
Mercury dissolved in water by boyling, precipita-
ted and sweetned by pouring thereto the oyl of
Tartar per deliquium, does also promote sweat by dis-
solving glutinous Phlegm, whence it is also good
for obstructions. ¶ The use of Sudorificks is pro-
per for such Diseases whose cause Nature often
thrusts forth to the habit of the Body by a sponta-
neous motion: Otherwise sweat is not to be pro-
voked indifferently both on the account of the
Diseases and of the Sudorificks themselves. If
there be thin, watry nitrosulphureous, acid, salt,
&c. Humours in the Body, and they be made apt
for excretion by digestives, or if others abound
which may be easily attenuated by Medicines, 'tis
safe to make use of Sudorificks, especially if the I-
dea of the Disease, the strength of the Body and
the disposition of the inward viscera be answer-
able.

Idem §. 14.
& seqq.

V. Fat men are not rashly to be soaked with
sweating: the lean that have a soft and loose skin
are most disposed to sweat.

Frider. Hof-
man. m. m.
lib. 1. c. 11.

Vidus vidui
l. 11. de
cur. generat.

VI. Not all humours are profitably lessen'd and
evacuated by sweat, but only some; not blood,
nor choler, but all sorts of phlegm, and all Serum
as well the watry, as the salt Muriatick, the acid
and sour. But glutinous phlegm, seeing it is not
so fit for motion, ought first, or at the same time
to be incided, attenuated and made fluid, that it
may the more easily be driven forth by or with
sweat: so an acid sour humour ought to be prepa-
red for its expulsion by sweat. That the menti-
oned humours are driven and expelled through
the Pores of the skin and so by sweat, appears
from the sweat it self, which sometimes comes
forth glutinous, often watry and inspid, some-
times muriatick or brine-like, sometimes also
somewhat acid or sour: and I think that there
sometimes, though but very seldom, flows forth
a sweat that is bitter; though it has never been
observed by me or others that such a sweat has
been procured by art and by the help of Medi-
cines, but that it has been spontaneous.

Sylv. de le
Boe m. m.
l. 1. c. 11.

VII. There are but a few true sudorifick Medi-
cines, and amongst these Opium is the chief: for
the reason why Treacle or Mithridate cause sweat,
is wholly from the Opium that is mixt with them.
I know by experience that these two Elestuaries
prepared without Opium, do not provoke sweat at
all.

Walent
m. p. 65.

VIII. I have often observed that Melancholick
persons who have had a very hot Liver, have be-
come Leprous by the too much use of Guaiacum:
and I have seen others that have had an hot Liver,
to get the Jaundise and other very ill Diseases
by a decoction thereof, unless it were very small
and made of Wood that grew far from the
bark.

Gesner. in
Epist.

H. ab Heerl
Obs. 22.
where is a
Story of a
young Man

IX. The Body ought to be prepared two ways
that it may be made apt to sweat: 1. by lessening
the quantity of the Humour; 2. by rendring all
the Body soft and loose, and opening the pores;
3. by so attenuating the thick Humours that they
may easily penetrate through any passages. Yet
we must shew which way that can conveniently
be done, seeing many are miserably tormented in
vain with Sudorifick preparations and Bed-cloaths,
whereby the faculty is rather wearied than any
benefit accruing thereby. Now the Medicines
which prepare the Body for sweating ought to be
the same as those which provoke sweat it self, such
as warm the Humours by their heat and moisture:
yet there is this difference, that upon taking the
Medicines which are for preparation, the Patients
are by no means to be compelled to sweat, but to
compose themselves to rest or sleep, without lay-
ing

that became
leprous from
a repeated
use of the
Decoction of
Guaiacum.

ing on them any more cloaths than usual; and these I use in this manner, I give the Patient a sufficient quantity of some decoction a little more than lukewarm betimes in the morning, and forbid him to sweat; and I give the like draught again a good while after a light supper, and the next day betimes in the morning I administer a Sudorifick, first ordering the Patient for sweating by covering him warm.

¶ Before the Humours offending in the Body be apt and disposed for expulsion by sweat, sweating is endeavoured with the prejudice and hurt of the Patients, for there will either none come forth, or not save that which is violent, whence the sick person will be necessarily weakned. As often as a Physician endeavours this, so often he betrays himself to be unskilful in his art. A Physician that minds his business, will not find it hard to avoid this inconvenience; if 1. from the Symptoms that are present and the preceding diet he find out the true fault of the Humours; if 2. (when Sudorifick Medicines shall be fit to conquer it) he chuse such as may produce the desired effect; if 3. he do not very much force sweat, but by dealing gently observe whether the Body be rightly and sufficiently disposed to cherish a sweat and after the use of the Sudorificks expect the further preparation and correcting of the Humours: For if he used such Sudorificks as were fitted for the correcting and amending of the offending Humour, though no sweat followed, yet he will do good in amending of the vitious Humours, and preparing for a more easie sweating afterwards. For Sudorificks that are fit for altering and correcting of vitious Humours, are always used with benefit, if the Body be not too much loaded with Bed-cloaths.

X. The most convenient time for sweating is the morning, and that on an empty Stomach: for then the sweat comes forth more easily and plentifully, nor is there danger of any harm, which we should deservedly fear if sweat were to be procured after aliments lately taken. For it is one thing at dinner and supper or a little after to take the fore-said decoctions, not to procure sweat, but to cut and correct Phlegm and temper acid Humours; and another thing to use them for expelling sweat presently, and that powerfully: for as I approve of the former, so I disapprove of this latter.

XI. In provoking of sweats Art imitateth the wonderful artifice of Nature: for in Fevers and other Diseases the never evacuates by sweat all at once, but at several times and by intervals, which is proved by long observation, namely part of the phlegm and choler being by degrees attenuated and turn'd into *halitus* for the greater part. Therefore as it is impossible to Nature, or however difficult, to attenuate all the offending matter at once, so as that it may burst forth into one only sweat; so Art ought to take example by Nature.

XII. Yet Art differs from Nature in this sort of evacuation, because she never attempts sweating safely and to health, but in acute Diseases as being caused by thin Humours and such as may easily be further attenuated and turned into *halitus*: but Art never bids us procure sweat but in the most difficult and long Diseases, though they be caused by a thick matter. The reason is, because acute Diseases do wholly refuse Medicines that provoke sweat; for seeing such Diseases are hotter than they should be, they are very much exasperated by those Medicines which are also hot.

XIII. Those who have hot Lungs, have thin Humours, and are therefore prone to sweat: so we see the Phthical to sweat almost continually, and to be weakned so much thereby, that the Physician is necessitated to hinder their sweating. ¶ Those do amiss that provoke sweat in Dropical persons by a decoction of *Guaiacum*: For you shall sooner draw water out of a stone, than sweat from a withered or refrigerated Liver.

XIV. Those are ill advised who order their Patient to continue his sweat for four or five hours: one hour or two at the most is enough. We must take heed the flesh be not colliquated by too great a *diaphoresis*, and so instead of doing good we do more harm. It is tyrannical counsel to digest the Body by sweat, whilst the soul faints and languishes. Prosecute sweating so long as Nature can bear it without languishing: an argument hereof is a full and free pulse. Concerning an hydrocathartick diet see the title of *purgation* § 52.

XV. Daily experience shews, that Sudorificks being often taken, I mean such as are gentle, and the Patient covered indifferent but not over warm, sweat that came not forth at first will issue out afterwards, and that to the great benefit of the Patient. Moreover if the pores in the surface of the Body be straitned by the external cold, or rather Phlegmatick Humours be coagulated there that obstruct the pores and so hinder sweat, by taking Sudorificks prepared of Incisers, the said Phlegm will be dissolved again, the obstruction will be loosd, the pores will be opened, and a way will be procured again for the sweat that is afterwards to follow.

XVI. Galen 8. meth. c. 8. for the cure of an *Ephemeric* or *Diary* Fever caused by a constipation of the pores, commends absterfion for the provoking of sweat: which advice that it is good is manifest, because if the sweat be absterged or wiped off, and so do not obstruct the pores or breathing-places of the Body, it occasions the arrival of more. Besides, absterfion is made with rubbing, which calls out the heat, opens the pores and draws the Humours from the centre to the circumference. On the contrary *Paulus* (l. 2. c. 47.) affirms, that sweat bursting forth in a Crisis is to be received so long as till there be enough evacuated: for he says that sweat helps with an indifferent heat and rest, so that it be neither wiped off, &c. And afterwards, But when sweat has issued forth largely, then it is convenient to relieve the Patient by wiping of him and taking off some of the Bed-clothes; for immoderate sweating wearies the Patient and often causes fainting away, &c. If therefore he be to be wiped that sweat may not be provoked, then he is not to be wiped for the procuring of it; for sweat by its heat keeps the pores of the Skin open and draws the Humours to the habit. Reconcile them by saying, That *Paulus* forbids much and hard rubbing, which according to his opinion depresses, dissolves, and debilitates the bulk of the Body, and makes Bodies more dense and unapt for sweat; and that *Galen* is to be understood of that which is soft and gentle.

XVII. When the Blood stagnates and stops in its Vessels, motion is most happily procured to it by Sudorificks, sometimes by Venesection: by the help of those the Blood is not only made more fluid and moveable, but the same is moreover actually moved, and more and more rarefied by the volatil Salt that is in them and by its stay alone does by degrees loose the Blood more or less concentered by its own acid Spirit and therefore agitates it. Whence a more frequent and greater pulse uses to be the companion of sweat; for whilst the volatil Salt of Sudorificks arrives at the right ventricle of the heart, and the Blood there becomes more rare, and does not only of its own accord seek an exit for it self, but by further widening the ventricle of the Heart, it excites the same to both a more frequent and stronger contraction of it self, and therefore moves the Blood more than before was somewhat deficient in its motion, and promotes its course every way from the Heart.

XVIII. Not only Medicines taken inwardly, yea and hot drink drunk freely provoke sweat, but many external things also: Thus the air alone heated by art and making a dry bath in a stove, or sitting by a good fire, powerfully draw forth sweat;

and when a watry humidity is redundant in the Body, it is driven forth by sweat this way easily and happily enough, but so is not a *scurvy*, or *acid*, or *Salt Muriatick Humour*: though a glutinous Humour may thus also be both attenuated and expelled by sweat, if so be it be continued long enough, lest the same Humour being dissolved by the fire and driven all about be again coagulated in the capillary Vessels and there breed obstructions and many mischiefs that follow thereupon.

XIX. *Bezoardicum minerale* is prepared of the Butter of Antimony, by pouring thereon the Spirit of Nitre or *aqua Stygia*. Where it is to be observed, that whilst these two liquors are mixed together, the Salts meeting by and by with one another are strictly combined, and in the mean time the Sulphureous particles, which are in great plenty, being utterly excluded fly away, & carrying some saline Bodies with them raise an heat and very stinking smoke: these being driven away, the saline that are left are more strictly combined with some earthy ones of the Antimony, and at length having undergone the fire, that the Emetick Sulphur may wholly exhale, and the corrosive stings of the Salts may be destroyed, they make an excellent Diaphoretick, inasmuch namely as the different Salts of the Medicine do meet with the Salts of our Body, with which being joined, the *compages* of the Blood and Humours are loosened, so that there lies open a free passage to the serous recrement. The dose is from a scruple to a drachm.

XX. Though a certain preparation of Antimony be called *Diaphoretick*, I know not to what sort of its particles this vertue can be attributed; and I have often in vain expected such an effect from this Medicine. It is often profitably given to stay fluxions of the Serum or Blood, because this earth being deprived of its proper Salts, does imbibe strange acid Salts, which it meets with by chance in the Body: which kind of vertue *Crocus Martis* prepared by a reverberatory fire seems to obtain from the like cause.

XXI. *Antimonium diaphoreticum* is rightly given with the species of *hyacinthopulvis ruber Pannonicus* and others for the promoting of expulsion. But we must note that it ought to be rightly and newly prepared, for as it grows old, it returns to its own Nature and Emetick vertue. Wherefore I advise never to mix Antimony with those Powders but at the time when you are about to use them, for till then 'tis best to keep them apart.

XXII. Let Physicians be mindful that those who are engaged in a Diet of *Guaiacum*, if they be not Purged every 8th or 10th day, and unless they go to stool every day once, do incur very grievous Symptoms.

XXIII. Most now esteem that Paradox for truth, that Decoctions of *Guaiacum*, *Sassa*, *Sassafras*, *China* and the like make People fat: Which *Horat. Guarantius* in his *resp. medic.* p. 235. thus explains: These Decoctions do attenuate indeed and dry up naughty and excrementitious Humours, but leave the good and profitable untouched: Therefore they bring no hurt to the wasted and emaciated. For seeing leanness and a fleshless habit proceed from bad nutrition, and bad nutrition from acrimonious and salt Humours which consume the sweet and profitable Blood, and hinder the Fat from being agglutinated; therefore it follows, that when those vitious juices are consumed by the foresaid Decoctions, the Body is of course rightly nourished and fatted. Thus far *Guarantius*. *Arceus's* way of curing Phthisical People by a Decoction of the Wood is well known, whereby he affirms they are not only hurt, but also grow fleshy.

XXIV. There are some who with an hydrotick Decoction give a Bolus of Turpentine and Ground Ivy, &c. but I like not the raising of two motions at the same time: therefore rather make a Bolus of

the powder of Harts-horn, Vipers and some appropriate Salt.

XXV. Besides *Opium* Salts promote Sweat, namely by their fufory quality; but 'tis necessary they should be depurated: whence common Salt and *sal gemma* promote it not at all. All Herbs that contain much Salt in them, drive forth also much sweat, as Wormwood, *Carduus bened.* being given in a sufficient Dose.

XXVI. It is an error of the Moderns to use Decoctions with water for fluxions, seeing it is clear that whatsoever Remedies are taken under the form of drink, though they be of a dry Nature, yet they alwayes increase moisture in the Body, especially if they be taken at Meals. Now I guess that the Physicians our predecessors were deceived by the Diet that uses to be prescribed to them who use *hydrotick Decoctions*: Who having observed that some troubled with long continued distillations, were cured thereof by a Decoction of *Guaiacum* or *sassaaparilla* or the like, which they had taken for the cure of the French Pox, brought in Decoctions of drying Woods and Roots, which had not at all been used for this purpose before, for the cure of Distillations: and the cure succeeded happily as long as they observed that exact Diet of thoroughly-baked Bread (or Bisket) with Raisins, limited to a certain quantity, and wholly abstain'd from drinking of Wine: But after that our Physicians indulging the complaints of their Patients, began to allow them Flesh, Eggs and Wine, it has been seldom observed that Distillations have been cured by these Decoctions: which is an evident argument that the Catarrhs were cured formerly not by the vertue of the Decoction, but by the drying Diet. Which yet not observing, and referring the difficulty of the cure to the stubbornness of the Disease, they will not yet give over such Decoctions; nay by repeating them often and adding dry Bals also, whereby they draw the moisture to the Skin with violence, they torment the miserable Patients with sweating, and which is worse, very oft by burning the Humours and perverting the natural temper of the viscera, they make those Catarrhs acrimonious and salt which of their own nature were mild and placid: Not considering that *Hippocrates* (1. de morb. mul. sect. 3. v. 183.) used a clean contrary way for the bringing out of the same moisture.

XXVII. In making the Decoction of *Guaiacum* we must have special care that the oily & acid Spirits, that otherwise by reason of their thinness are very apt to exhale in the common boiling of Apothecaries, may be preserved as much as they can by art, because the Sudorifick vertue of the *Guaiacum* consists most in these, which vertue is increased if the Salt extracted Chymically from the calcined faeces be mixt therewith.

XXVIII. Those are much mistaken who think to draw out all the vertue of the Wood at the first Decoction: for the second Decoction is sometimes stronger than the first.

XXIX. *China* and *Guaiacum*, seeing they are of an unlike nature, are not to be mixt together: which I chiefly gather from the duration of each Decoction. Because the Decoction of *China* continues not good above 24 hours, but will presently putrefie; but a Decoction of *Guaiacum* will continue good even for eight days. You will say that the making a Decoction of these two in no greater a quantity than may be spent in one day, will prevent the danger of Putrefaction: I will admit this indeed, but this is no reason why the mixture of these two together should not be suspected, because the Decoction of *China* being so apt to putrefie, exercises its Operation: and if any thing be added which may change the nature of this Decoction, its operation will be changed also, which is always joynted with the proper nature of the Decoction. And

I would say moreover that experience teaches that these two Medicines do not endure one another: when to pleasure some Physicians I have admitted of their mixture; truly I never saw them do well.

XXX. A Decoction of China requires not that strictness in Diet as a Decoction of Guaiacum or Sassa: For the Indians and Spaniards follow their business even without doors whilst they drink this Decoction, and eat any thing that comes to hand, even Fish: But we in Italy never grant our Patients so great liberty, because we permit them not to go out of doors, nor to eat Fish, or eat many other things which healthy Persons use; though we are much against a very strict order in Diet, which I commend again and again in the use of the Decoction of Guaiacum.

XXXI. Sassafras would be good for many Diseases if it exhaled not too much into the Head.

XXXII. Carduus bened. operates more in substance than in Decoction: where five ounces of the Decoction were convenient, give a drachm of the powder.

XXXIII. We must observe concerning the Roots called Aperient, that some Practitioners mix them sometimes with provokers of sweat, as in the small Pox (perhaps that the Humours may be attenuated, and more happily and easily resolved into sweat and vapour) which truly is to be done but in a small Dose, to two or three ounces at most, otherwise they will lead the attenuated Humours to the ways of Urine which diminishes sweat; for which purpose the Arabians mix them with a Decoction of Lentils.

Morellus de
form. rem.
c. 1.

XXXIV. 'Tis to be esteemed no small matter that an Humour offending in the Body may be both corrected and expelled by the same Medicine; which 'tis strange should be denied by any, and those daily buied in practice, who therefore are willingly ignorant of what they might easily observe. For there are not a few who from a very gross prejudice think, that not only Purgers, but also Sudorifics themselves, as often as they do not move the Humours by Stool or Sweat, do a great deal of hurt, and cast the Patients into great dangers. This opinion of theirs, as I was heretofore solicitous about it, so I now laugh at it as vain, since experience has often taught me the contrary. Therefore there is nothing more false, that I say not more hurtful to the Patients, than to think, that Sudorifics especially do harm as often as sweat follows not upon the taking of them. I confess indeed if upon taking a Sudorifick the Patient be covered with a great many Bed-Cloathes, and be kept a long time under them, he will be uneasie and ill, from the Bed-cloathes more than from the Medicine he has taken: but that is not to be ascribed to the Sudorifick Medicine it self, but to the preposterous use and ill administration of the same. ¶ Therefore Sudorifics prepared of inciders and attenuaters, and given at several times, do loosen and incide both the Humours themselves that are to be driven forth by sweat, when they are viscid, and also others that are mixed with them and are likewise viscid, as likewise others that are coagulated in the pores and surface of the Body, and dispose them all by degrees to the Sweat that is to follow,

Suppositories.

The Contents.

What such they ought to be. I.

'Tis unprofitable to make them very long. II.

I. Neither let Suppositories be too acrimonious nor too frequent; Not too acrimonious, lest by their irritation they open the hemorrhoidal Veins, seeing that part is very sensible: Whence though they may be made even of crude Alum, yet seeing such are too acrimonious, they are to be made use of warily. There is the like reason of others. Nor ought they to be too frequent, for by Nature's being accusom'd to them the Sphincter becomes more dull, so that it will promote excretion unless solicited thereto; which holds also of Clysters. I have sometimes observed this in Infants, in whom Suppositories being frequently used in a continued continuance, have as it were by accident the more increased it, inasmuch as the sense being hereby made more dull, seemed to require ever and anon a new application.

Wedel.
pharm. p.
143.

II. They are made round like Candles, nine Inches long, whence they call them Candles from the similitude. But so great a length is wholly unprofitable, seeing Suppositories irritate not the expulsive faculty saving where they touch the *podes* or extremity of the straight Gut, for that part is the most sensible. Make them therefore not half that length, and about as thick as ones Finger, sharp at both ends, that they may be the easier thrust in and pull'd out again.

Suppuratives.

The Content.

They are not proper for all Tumours.

Suppuratives are profitable for sanguineous Tumours, which are their *Indicant*; because extravasated Blood is turned into matter. But such Tumours as are not of the nature of these do not so much require them, or if the collection of Blood be not so great or raise not so great a Tumour but that it may be dissolved or pass back again into the Veins: whence in an *Erysipelas* (7. *aph.* 20.) one shall not use them without harm. So in Malignant and Poysonous Tumours they have hardly any good success; but they are least profitable in Melancholick Tumours, as in the Cancrous. Likewise they are not so convenient in Parts weak by Nature; nor have they place in internal Parts if there be an extravasation any where, but in such case we must only resolve, for instance in the Pleurisie: so that Suppuratives are proper only externally; and internally such things indeed as ripen and concoct the Humours, are profitable, but so are not Suppuratives. But their chief use is in Byles, Abscesses, and Tumours that turn to these, arising from a conflux of Blood, or however not without Blood, as in Glandulous Tumours, which are also hard to suppurate.

Thoracicks;

Thoracicks, Pneumonicks.

(See l. 14. *Pectoris affectus in genere*, or the Diseases of the Breast in general.)

The Contents.

They respect either the ways; I.
Or the Humours; II.
Or the expansion hindered. III.
Their matter. IV.
Inciders and incrassaters are not to be confounded. V.
Bechicks are not to be confounded with Resolvers. VI.
Astringents are to be added to Resolvents. VII.
Too great driers are to be avoided. VIII.
As likewise too great looseners. IX.

I. **T**horacicks respect either 1. the ways or passages, that are necessary for letting in and expelling the air, which they clear, and free the pipes of the Lungs from what stuffs them, such as are both inciders and attenuaters, whether indued with a simple volatil Salt, as Aron, Lobelius's Syrup of Erysimum, or with a Balsamick oyl, as Honey, which are good in thick, tough, clammy flegmatick Humours, in the Asthma and wheezing Cough; and also lenients and smoothers, Syrups, Lohochs, &c. which are most useful in an hoarseness, and in a cough also in general.

II. Or 2. the Humours, whether thick, such as are the aforesaid inciders and detergers; or thin Acrimonious, salt, destilling Humours, such as are things earthy, mucilaginous, Opiats, Bole-Armene, Mastich, Frankincense, Treacle, which are good for Salt and thin catarrhs, spitting of Blood, &c. or Humours declining to Putrefaction and an Ulcer, such as are things resisting Putrefaction, Balsamick, earthy precipitaters, never omitting smoothers, and vulneraries and consolidaters, as there is occasion, which are useful in a Phthisis.

III. Or 3. expansion hindered, and that as in other cases, so chiefly when the afflux and irruption of the Humours attempts an inflammation and abscess, in which case besides universal Diaphoreticks that reduce the Blood into order, Medicines resolving the coagulation are good, such as are most Antipleuritics, Antimonials for the greatest part, and such things as are profitable for a fall from on high. These very things oft shew Nature another way, so that what is ordinarily expectorated by cough, uses to be deposited by stool. But in all these, expectoration is never to be neglected, but the promoters hereof retain their due praise.

IV. Their matter as I have said above, consists of 1. Acrimonious volatils endued with a volatil Salt, as the Root of Aron, Sea-squill, Mustard, Erysimum; likewise bitter things, as Scordium. 2. Things endued with a mild volatil or oily Sulphur, as the root of flower-de-luce, of Fennil, of Elecampane, Sun-dew, Aniseed, Sassafras, Amber, Benzoin, distilled oyls. 3. Sweet and roscid mucilaginous things, Sugar-candy, Syrups, Lohochs of all kinds, Honey, Lykorrhize, which two classes contain most Bechicks or Pectorals, not omitting resolvers sometimes. 4. Resolvers, and partly such as dry lightly, and partly such as promote expectoration, as Crabs-eyes, sperma ceti, Bores tooth, Antimoniam Diaphoreticum, Gummi Ammoniacum, Amber, asthmatick waters, Chervil. 5. Earthy precipitaters, absorbers, consolidaters, as Scabious, Colts-foot, Bluellin, Antimonium Diaphoreticum, Poterius's Antibeticum. Hither belong also 6. the more temperate mucilaginous things, Marsh-mallow, Jujubes, Se-

bestens, Gum Arabick, Tragacanth, Bole-Armene. The rest, as 7. watry dilaters, and 8. astringents appear by what is already said, and some of them are common. Likewise 9. Opiats, Diacodium, &c.

V. In Diseases of the Lungs, the order of Thoracicks that incrassate and incide is not to be confounded nor inverted; that is, Incrassaters are not to be given, where viscous, clammy, phlegmatick Humours offend; nor inciders and attenuaters, if there be a destillation of such as are thin, salt and Acrimonious.

VI. Nor are Bechicks to be confounded with Resolvers, yet they may be conveniently mixed with one another as there is occasion; as for instance in a Pleurisie and Asthma 'tis best to use Resolvers more, and in a Cough or Phthisick Bechicks. But he that presumes to cure the Pleuritical with Bechicks alone, especially with *linctus*'s shall kill his Patient; and he that will cure the Asthmatick thereby, shall expose him to no less danger.

VII. In Diseases of the Breast we must not bind without Resolvers, namely 1. that provision may be made withal for the grumous Blood, as in the *Hæmoptysis* (or spitting of Blood) which is done by Crabs-eyes, though taken only in a secondary dose; both intentions are also satisfied by Corals, Bole-Armene, terra sigillata: 2. that the tone of the Lungs, which naturally ought to be loose, may be regarded by this means, and expansion not hindered.

VIII. Things also that dry too much are either to be avoided among thoracicks, or to be mixed with moisteners; as for example, Antimonium Diaphoreticum, Poterius's Antibeticum dry more, as also common Sulphur, the flowers of the same, the pure Sulphur of Antimony. Hence also fresh pectoral plants are better when we would moisten and absterge more, as for example, in a phthisis or the like; but when we would consolidate, as in spitting of Blood, then those which are more dry.

IX. Too great looseners, whether inwardly or outwardly are likewise to be avoided: for they both debilitate the tone, and spoil the Stomach, and themselves cause a want of appetite: whence it is not adviseable to use pectoral *linctus*'s in great plenty & for continuance. These by further widening and dilating, dispose the more to a reception of an afflux; whence there ought to be a caution also in pectoral ointments.

 The use of Powders in the Diseases of the Belly. XXVII.

I. Let's not, with the vulgar Physicians, always begin with evacuation of the Body, without any distinction. Therefore we must know that there are four sorts of Diseases to which our Bodies are subject, and that we ought not either to admit of or require that Providence in them all.

1. An intemperature of the habit sometimes happening to a Part does vitiate the Aliment without any access of Humour; in which regard the cure is performed by Alteratives only without the administration of Evacuators: yea in the same Distempers it is often found that Purgers do harm, as also Bleeding.
2. It often happens that the *sex* and vapour of an Humour settled in a Part, does defile and vitiate the Humour that arrives thither: this sort of Ail requires not the agitation or purgation of an otherwise healthy Body, but the ridding and discussing of the matter that is settled in the Part, by evaporating, sudorifick and deobstruent Medicines: for this kind of Malady occurs frequently in many periodical Diseases and Agues; for there is left somewhat feculent, whilst the Body is pure and purged, in a Gouty Person in his Feet, in a Nephritick in his Kidneys; in an Asthmatick in his Breath, in a Tertian or Quartan Ague in the place of their Origin, keeping the Period of a lingering but long continuing Fever; for that which is left when the cause is taken away, is not always put to flight by a purely contrary alteration, there often remains indeed a portion of the Humour settled in the Part, which unless the Physician dissipate by Digestives, he shall use Alteratives in vain: In which as Purgations do often more harm than good, so Topicks bring manifest help.
3. It often happens that the affection of the Part is material, and depends not on the whole, but on some superiour member, as a Disease of the Breast on a fault of the Head: In which kind of Malady 'tis necessary that a Providence precede, yet not of the whole Body, but of the Part which first sends the fluxion. Wherefore neither are those to be hearkened to, who that they may seem to have purged the Head the more regularly, do first without any need disturb the whole Body with Purgers.
4. There remains only a fourth difference of a material Malady, depending on the whole, which justly requires that the Body be evacuated by Purging or Bleeding before the application of Topical or local Remedies. Whence it is clear that Galen 1. *met. 7. 8.* said true speaking of an *Alopecia*, That a particular Disease, if it be light, is cured by Remedies applied only to the Part affected, &c. ¶ When we say this is to be done before the other, it is not so to be understood, as if we should abstain altogether from this, till the other be perfected: we erre greatly this way in acute Distempers. As for instance, Local Remedies are not to be applied before we have made Provision for the whole Body; nor must we use attemperaters before evacuation; what then? shall we apply nothing to the Head or Hypochondres in a Phrensie or an Inflammation of the Liver, till we have let exactly so much Blood as is necessary? Indeed before we have let Blood 'tis not good to apply any thing to the Head or Liver; yet neither must we tarry for an intire and perfect evacuation of Blood before we apply Repellentents; but beginning the cure always with those things which according to Art ought to be

first, we may interpose these other, &c. ¶ Indeed practical Precepts are never to be taken universally, but they are to be moderated by the indication of urgency. For Galen affirms this also, That the Body is to be evacuated before we come to Topicks; yet in any dangerous Inflammation we never abstain therefrom till all the Blood-lettings have preceded; but when we have bled once or twice, we begin to apply those things which seem fitting. So often in the same inward Inflammations, when they did not yield enough to revulsion, and I was afraid there might be great danger in the greatness of the Phlegmon, by using bleeding on the same side, and Cupping-glasses upon the Part with Scarification, by turns, I think I have preserved some from Death to admiration, when other Physicians were for delaying, and observing a Method that is not always profitable. ¶ Galen was so afraid of a Cacochymie, that he forbade applying Local Remedies to the Part affected in Cacochymical Bodies, unless they were first cleared by Purging and Clysters and Fasting; lest the corrupt Humours rushing into a Part though but lightly affected, might suffocate the innate heat thereof, and the Disease of the Part, that otherwise were not dangerous, might become deadly. ¶ If the offending matter be in the Part affected in some little quantity, then there is no inconvenience in strengthening the Part; because when the Part is strengthened, that little which is left, is easily resolved by Nature. Thus Galen (14. *Meth. 9.*) says that in the beginning of a Cancer the Excrement, if it be but small, is to be repelled to the principal Parts; because unless it be suddenly repelled, the melancholick Humour presently distends the Veins, and by their being extended the Cancer is rendered incurable. Likewise (*cap. 17.*) speaking of an *Herpes* he says, If some part of the Excrement be repelled to the principal Parts, a little thereof does no hurt, because it is resolved by the *viscera*.

II. There are Nine cases wherein Repellents are not convenient: 1. When the Humour flows to the Emundatories: 2. When the matter is Poisonous: 3. In a critical Motion: 4. When there is a Plethora, or Cacochymie: 5. When the Part is so weak that there is danger of extinguishing its heat: 6. When the matter flows to a Part that is near to a principal one: 8. Whilst the matter is fixed: 9. When the Tumour is caused by congection. Two other cases are proposed by Guido, which may be rejected: the one is, when the Disease proceeds only from an external cause; the second, when there flows only a thick Matter: The first case is very vain, because in Wounds we forthwith use Repellents; The second is opposite to Galen who (14. *Meth. 17.*) says, That some Repellents are cold and moist, fitted for cholerick Humours; and that others are cold and dry, which are stronger, because they bind, and these are proper for Phlegmatick and thick Humours. The same is confirmed by Galen (6. *de med. local. c. ult.*) where in yellowish ichors he uses Repellents that are rather cooling; but if from Phlegm, astringents. ¶ Repellents do not only exert their vertue upon Diseases from a fluxion of hot and thin Humours, but they also fight against cold Distempers and Fluxions. For thus does Galen (2. *art. cur. ad Glau.*) bid us cure *Oedema's* (or Phlegmatick Humours) namely by using Repellents in the beginning, though such Maladies proceed not from a thin and hot Humour, which kind he proclaims a thousand times requires Repellents.

III. Is the efficacy of Repellents such, as to cause that to be resumed into the Veins, which was slid out of them into unnatural spaces? That this is possible, is proved, 1. By the breakings out; or pimples in Children, which are often hid on the sudden by the repercussion of the cold Air: 2. By the authority of Galen (1. *art. med. c. 85.*) But emptied

plate)

places draw to themselves. An inflammation of the Liver or Spleen is cured by letting Blood in the Arm, though in the Liver the Blood is forcibly dispersed out of the *Porta* through the fleshy Pores. In those who are anointed for running Sores, Scabs, and the French Pox, 'tis wonderful how suddenly those thick Pustules, Tumours, Nodes are transmitt by Vessels to the Mouth to be spit forth in Salivation: The cure also of an *Echymosis* shews the same thing, which is performed for the greatest part by Repellents; where there is no doubt but the Blood is extravented, and that it does return into the same again by the help of Repellents.

Idem ibid.

IV. Let not the Physician persist so long in repelling as till all the Matter retreat that was flown into the Part; but let him either mix other Remedies with Repellents, or use some other Remedy: for it is dangerous and bad to persist very much in cooling of the Parts; for often the Malady is either changed into one of a worse species, or the Part perishes.

Idem ibid.

V. Some do so carefully observe the mixing of Resolvents when the beginning of the Disease is over, and increase them as the Disease increases, till in the state they use them alone, that they can be persuaded by no accident, nor by any necessity that supervenes, that it is fit to do any thing else, always taking the indication for their so doing from the time of the Disease. By which it appears that they have understood *Galen* amiss; who though he did not only receive, but set also much by the indication from the time of the Disease, yet he does that only for knowing the nature and state of the Disease; but does not reckon this indication amongst the Curative, as being quite different therefrom. As the preceding cause is not to be taken care of, but the present Disease of the Body; so neither is the time of the Disease, but its condition to be examined for an intention of cure. Thus in the beginning of an inflammation, because the vehemence of the fluxion is known from that time, 'tis understood what occasion there is for Repellents, not indeed upon the account of the beginning, but of the Fluxion: for if the Fluxion return in the declension of the Disease, *Galen* persuades us to repeat Repellents. To be short, He measured the use of Repellents and Resolvents according to the indigence of the Fluxion or the Humour already flow'd, &c.

Idem ibid.

VI. We ought to know that those erre very much, being deceived with the shadow of a Reason, who use a great deal of Wax in discussing Remedies, and mix other Emplastick Medicines therewith, thinking that by its sticking fast it works the more effectually; not knowing that the whole business of resolution is performed through the Pores of the skin, which themselves shut up by such Medicines.

Idem c. 16.

VII. Astringents being added to Digestives help their penetration: but by Astringents the strong are not to be understood, as Galls, *Acacia* and the like constipaters of the skin; but the most moderate, as *Mastic*, *Roses*, &c. which by a certain expression help towards the greater penetration. This is confirmed by *Averroes's* Experiment; If one take leather and anoint it on one side with common Oil, and on the other with Oil of *Roses*; then the Oil of *Roses* will penetrate sooner than otherwise it would do, and yet it hath a moderate astringing vertue.

Sancr. Art. parv. cap. 95.

VIII. *Burhus*, an Italian Physician, makes all his Plasters of volatil matter, so that the Ointment that is laid on one day, will hardly any of it be found the next: and he blames Physicians for making those thick Bodies into Plasters which cannot enter in at the Patient's Pores.

IX. Bath-clays are commended for softening confirmed Tumours; but with these Cautions, 1. That a great quantity thereof be applied; 2. That

they stay a good while on the Part; at least four hours in the morning, and as many at night; 3. That they be spread wide, so as to cover not only the Part affected, but the neighbouring both above and below. Let the like Cautions be observed in Plasters, with which if we would soften hardened Parts, we must not apply them by scraps but spread them large: By this artifice I have known some Mountebanks do miracles in the cure of Tumours, when yet they used only the common Remedies that every old Woman and Barber knows of, only varying the manner of applying; for they roll the Arm (for instance) all over with Plasters, and lay not a patch only on a place.

Th. Bartholin. Cent. 4. Hist. 9.

X. *Aristotle* 1. *Self. Probl.* 46. will have Cataplasms to be changed at certain intervals, though they have lost nothing of their vertue, because Nature is not affected by any Remedy she is accusom'd to for some while. What he says of Cataplasms, may be understood of every local, and indeed of every Medicine; because they all act on the account of their being contrary: when therefore they become like through custom, they can act no longer, because no Passion is made by what one is accusom'd to. Hence those erre who in laying on Cerecloths say, that they are to be kept so long upon the Part as till they fall off of their own accord. Besides they are of a contrary opinion to *Galen* and *Avicen*, who unanimously say that neither internal nor external Medicines are to be rendred customary to Nature.

XI. 'Tis a great error when malaclick Plasters are made of *Galbanum*, *Ammoniacum*, *Opopanax*, *Rosin* and the like, and are diluted with much Vinegar; for so they attenuate, incide, discuss and not mollifie.

Hollerius.

XII. The use of Fomentations is sufficiently famous amongst Topicks, which are made of some Liquor or Decoction of many Simples, which several include in a Bladder: but the same are made unprofitable by that means; for the vertue of the Simples passes not through the Bladder into the Body, but the heat only operates: whence if some part be only to be heated, such Fomentation does good, let the Liquor that is included be what it will; as also for easing Pain and digesting Humours: But if obstructions be to be dissolved, or something be to be mollified, 'tis better to use either linen or wollen cloths.

Primros. de vulg. err. l. 4. c. 46.

XIII. Anointings that are very oily do obstruēt and stuff the Pores, unless a little spirit of Wine be added; or before the anointing rub the Part with a Squill newly cut through the middle, to make the Medicines penetrate the better.

Fortis.

XIV. A Person falling out of his Chariot, divers Accidents superven'd, such as use to befall Persons bruised, and amongst them the motion of his Arm was much impaired. For fear he should quite lose the use of it, his Spine is anointed with strong Ointments, and hot Plasters are also applied, upon which he fell into a Fever; from which yet he is soon freed by leaving off those Topicks: He said he perceived the heat very sensibly to proceed from the Medicines (namely in the great Vessels that run that way.) After some Weeks they fall again to Topicks, and the Fever returns again: whence 'twas thought fit to abstain from those stronger and to use an appropriate Water, by which he was cured.

Phil. Sal. math. Cent. 1. Obs. 79.

XV. This is to be esteemed for a most certain Proposition, That never any Powder is to be sprinkled upon any Part, unless it be first anointed or wet with some clammy Liquor, that the Powder may be made to stick on, except in the Head, where the Hairs sufficiently retain the Powder that is sprinkled amongst them. Thus for Bruises of the Limbs we use astringent Powders in the beginning to hinder a Fluxion, and those not only in the bruised

bruised Part, but in the neighbouring Parts also; but first of all we anoint the Part with some astringent Oil, as the Oil of Roses, Myrtles, Quinces, &c. Pouders may also be kept on, if the white of an Egg strongly beaten be smeared over the Part.

XVI. The use of the cutaneous Veins comes all to this, that what Blood remains over and above the nutrition of the skin and subjacent Parts, may be carried back by them to the larger branches and trunk of the *Cava*. Hereby the virtue of Topicks applied to the Wrists, transmitting their Particles and Atoms through the Pores of the skin, may be communicated to the Blood, yea to the Heart it self. Some Veins have that great virtue and power, that they can communicate to the Heart the deadly poison of things laid to the skin by stealth though never so slightly: This poison is carried to the Heart by the Veins which carry back the Blood to the Heart. ¶ Those Physicians are not to be heeded, as being more subtil than skilful, who reject the use of all Ointments, Plasters and Liniments, because it does not seem probable to them that fat and oily things can penetrate through the Skin, Fat, Membranes and Muscles of the *Abdomen* that encompass the contents: But though this seem improbable, or at least difficult, yet daily experience witnesseth that internal Diseases of the *Abdomen* (or Belly) are daily cured only by the use of Ointments and Liniments. Now though the laudable effect of Oils and oleous things may suffice to prove their penetration through the skin and other parts; yet the ways also may be determin'd by which oily things may penetrate even to the inner Parts of the Belly, namely the Pores of the skin, from which there is a passage to the Vessels, and consequently to the Heart. For seeing all the Parts of the Body are made up of various Particles, like natural *Minima*, and therefore of Atoms joyned and wrought together; it is not probable, seeing they are diversly shaped, that they are so exactly fitted to one another, but that there is every where a passage through them for fluid Bodies, and especially for such as are volatil: which *Hippocrates* also observed when he pronounced the whole Body to be pervious, and any one may observe that views either the Bones, Gristles or other Parts, and notes them to be porous, especially when he considers the same with magnifying glasses, and compares them with things made by Art, linen or wollen Cloths, which though never so close, yet are pervious withal; for he will acknowledge and conclude that there are every where Pores, sometimes larger, sometimes straiter, in all natural things.

XVII. Many are often deceived in outward Alteratives, as Ointments, Plasters, Cataplasms, &c. whilst they let them lie longer than they should upon the parts affected, and see not that custom makes Topicks like to the heat of the parts, and when they are made like, have no further power to alter: And the reason is most manifest, because all Alteratives alter only so long as they are unlike. Hence *Galen* 3. *de temp.* says that when Lettuce is assimilated it does not cool. *Aristotle* (1. *Señ. Probl.* 46.) being to shew why custom takes away the virtue of Alteratives, asks why Cataplasms ought to be changed? To which he answers: As those things which we commit to the Stomach, if they be Medicines, in tract of time are no longer Medicines but Aliments; in like manner Cataplasms that one has been long us'd to, do not do their office. What the Philosopher says of a Cataplasm, is to be understood of all Alteratives inward and outward.

XVIII. Let Refrigeraters be moderate, endued with that faculty rather in power than in act: for things that are actually cold do condense the Pores, incrassate the Humours, and fix the Blood in the

inflamed part. *Rhazes* used the clarified juice of Endive, which we also may give to four Ounces in a Decoction of Mallows, Violets, and Barley.

XIX. Though Oils made by infusion may seem by their unctuousness to obstruct the Pores of the Skin when they are smeared upon it; yet fomentations may remedy this; which are to be used before the anointing, as also such things as may help the penetration of the Oils.

XX. Ointments cool less, to wit comparatively; or they are oftener prescribed with an intention to heat than to cool; and therefore by consequence we must not equally and in every regard rely upon refrigerating ones, as for instance on the refrigerating Ointment of *Galen*, *Mesue's* Ointment of Roses, because of their oiliness.

XXI. The same do not astringe much, from that general induction that all oily and fat things relax, whence they are improperly called Astringents. Hence also, except *Unguentum Comitisse*, which being anointed on the Loins, is commended for nocturnal pollution; or on the *Pubes*, for too great a flux of the Terms; there are few astringent Ointments to be had in the Shops: And those which are administered with that intention, do profit more by their strengthening Aromatick virtue in the *Dysenterie*, fear of miscarriage, vomit, or *cholera*, than by any thing else.

XXII. Where we would avoid laxity, they are not convenient: Hence what we have said already of Stomachicks, holds also of the Joints, namely in the Gouty, that unguentous things hinder transpiration, cause a greater afflux, and are apt to fix the Humours in the parts affected, so that 'tis more adviseable to let them alone. Yea even in Diseases of the Lungs, though they loosen the matter that sticks in the Pipes, yet they are apt to cause a greater afflux therein, whence in that case Resolvents are better, as *unguentum rubrum potabile*. Whence when any of the viscera are too much bound up, they may be used; but not when the viscera are too lax, for they do but increase their laxity.

XXIII. The same are not good in a Cancer, because by Emollients that acido-saline acrimony is more provoked and spread: whence Tumours that are not cancerous, become such by the use hereof. They are bad for the Hemorrhoids, (See Book 8.) for Inflammations (See Book 9.) whence they are not to be used indifferently for the Quinsie, as is prescribed in Books of Practice; for loose Ulcers, as of the Lips, for instance, because they are apt to promote foulness. Yet note that this is chiefly to be understood, 1. of purely fat oily things, especially the vulgar Ointments; 2. When they are let alone and not changed; for otherwise 'tis very well known that *unguentum de lithargyro* is much commended for Burns and other things. In a word, whatsoever Distempers are hurt by fat things, are hurt also by Ointments.

XXIV. Note that what Parts soever are more hurt by cold things, as the Stomach, Liver, Spleen, the same generally do require hot Epithems: and on the contrary. In particular there are some who always bid us apply to the Head things only that are somewhat warm; but Experience testifieth the contrary, whereby 'tis frequently observed that cold things are continually applied to the Head.

XXV. Whatsoever Diseases, or Parts affected, are hurt, increased, or exasperated by actual moisture, Epithems are not so proper for them: whence they are not good in Burns, for in that case Demulcents, in the form of a Liniment, are more advantageously prescribed than pure water: Nor in an Erysipelas and other Inflammations; for though some apply therein linen rags wet in cold water and wrung, by way of fomentation, yet that is not so safe, for

fear of repulsion, especially if the *Erysipelas* be in the Face: But in Practice it is to be observed as a Rule. In every true *Erysipelas* dry Topicks (the *Pulveres Erysipelatodes* of *Ludovicus*, *Mynsichtus*, &c.) are better than moist ones. Hence also 'tis better to let them alone in *exanthemata*, Small Pox, Measles, *Petechia*, &c. Whence also in that case we use not so commonly to apply moist things to the wrists, or bags and Epithems to the Heart, no nor to the Forehead lightly, for allaying (for instance) the symptomatic pain of the Head. On the same account they are not good in Catarrhs, *Coryza*, &c. for as Baths are bad for these, so also are Epithems, as being particular lotions, in that they move the *Serum* the more. Hence they are less profitable in the beginning, but after and with others, as if all these external things were respectively to be called in rather to the acid, or, if we will grant more, the society of internal Remedies, than to bear rule, wherein indeed men offend in both excess.

Idem.

XXVI. Emollients are not good for melancholick Tumours, which (Tumours) are endued with a saline acrimony, like Mercury sublimate: whence is that golden admonition of *Galen* *S. de simpl. m. fac. cap. 9.* That a Cancer and cancerous Tumours are exasperated by emollient Medicines. For by this means the Pores are the more dilated, whereby both an afflux of Humours is procured, and the corrosive acrimony is spread further, seeing it can neither be dissipated nor concocted, nor brought to digestion; and so mollifying is the encreaser and parent of Putrefaction. See *Wærus Obs. p. 95.*

XXVII. We use not to lay Powders on the Breast, as we do on the Belly, yet after anointing with convenient Oils. For Powders sprinkled upon a part are more less effectual than when reduced into the form of a Liniment or Cerecloth, because they are prepared of odoriferous things, and the virtue of such things exhales by boiling, unless they be boiled in a double or close Vessel. Now Powders may be made more or less hot with respect to the intemperies, and the thickness of the parts of the Hypochondres; for those who are fat have those parts very thick, wherefore the Medicine must be both the stronger and the thinner, that the virtue of the Medicine may reach to the part affected: but those who are of a spare Body, need Powders that are less hot, but more astringent, because they hinder the dissipation of the Native heat.

- The efficacy of Vesicatories applied to all the fore-part of the Head being shaved, in sleepy Diseases, the Cataplexie, &c. XIV.

I. THE Humours that are evacuated immediately by a Vesicatory, issue partly out of the

Pores and Glandules of the Skin, partly out of the mouths of the Arteries, and partly out of the ends of the nervous Fibres: perhaps out of the mouths of the Veins a little of that juice that is newly received into them, but it does not seem that much can be sent back again. 1. The Skin, which consists of a double coat, very porous, and is likewise thick beset with very numerous Glands with fat, also with the ends of the Vessels and Fibres that terminate in it and are variously woven with one another: wherefore when the cuticle is taken off by a Vesicatory, and the true Skin lies bare, the nervous Fibres being twitched do constringe and wring the Glandules and Pores, so that the serous Humour contained in them both is plentifully squeezed forth. Moreover seeing the Pores open one into another, the serum flows not only out of the blistered Part, but sometimes a portion of the Serum coming from the neighbouring Parts succeeds in the Pores that were first emptied, and then by and by issues forth. Wherefore in the Dropsie called *Anasarca* Blisters raised by a Vesicatory drain the water from all about in great plenty, and draw it forth from all the neighbourhood, yea sometimes from afar. 2. The mouths of the Arteries about the blistered Part being uncovered and twitched, do not only spue out that portion of Serum that is accustomedly brought to them; but the serous Humour being through the whole mass of Blood imbued with the Stimuli of the Medicine, is thenceforward separated more plentifully from the Blood, and every time it circulates with the Blood, a greater quantity of it is cast off by the same mouth of the Arteries being continually irritated. Moreover together with the serum sent thus from the whole mass of Blood to the Blisters, other Recrements, and sometimes the morbid matter itself, do plentifully separate therefrom also, and are sent off through the same Emissaries: and this is the reason why in malignant Fevers, yea in all putrid ones that have difficult Crises, when the Recrements and Corruptions of the Blood being unfit for excretion, threaten the Heart or Brain, Vesicatories which continually and by degrees drain them forth, do often notably relieve: To which add, that the same do moreover alter and restore the Blood degenerated or depraved as to its Salts, yea by opening or subtilizing its compages dispose it to an eucrasie. Wherefore this kind of Remedy is often very profitable not only in a febrile state of the Blood, but also when it is otherwise vitious or cacochemical. 3. That Vesicatories do evacuate a certain Humour out of the Nerves and nervous fibres, and therefore profit in Spasmodick or Convulsive Maladies, is witnessed both by Reason and Experience. For I have shewn in another place that the liquor that waters the Brain and *genus nervosum*, does sometimes abound with heterogeneous Particles: Moreover it appears by frequent and familiar Observation, that the impurities and recrements of that liquor, together with a watry latex, do sometimes of their own accord upon the arising of a flux sweat out of the Nerves and nervous Fibres, and either restagnating into the mass of Blood, are carried off by Urine or Sweat, or being deposited into the Cavities of the viscera are sent forth by Vomit or Stool. Wherefore when by the application of a Vesicatory the extremities of the Nerves and nervous Fibres are any where laid bare, and are greatly irritated, presently the Humour that flows in their extremities is spued out, yea and therefore the whole latex though seated a great way off in their Ducts, is both freed from its stagnation, and withal the heterogeneous Particles, mixt with that nervous latex, being every where agitated and derived from the Brain, do by degrees glide towards the newly open'd Emissary, and at length are sent out.

willit.

II. From what has been said we may gather for the curing of what Diseases this kind of Remedy is chiefly

chiefly profitable: for through the evacuation that it makes out of the *Pores and Glandules of the Skin*, as often as a serous, salt, acrimonious or otherwise mischievous Humour is collected in these Parts or in their neighbourhood, and being excluded from the circulation of the Blood sticks pertinaciously there, there is certainly no readier or easier way of draining it forth than by applying a Vesicatory above or below the Part affected. Wherefore a Vesicatory is not only indicated by an *Anasarca*, and by all *defilements* or eruptions of the *Skin* whatsoever; but moreover is required in *Pains* whether *arthritical* or *scorbatic* fixed any where in the outer habit of the Body or in any member. 2. In respect of the *Blood*, which wants both to be leisurely cleared from any heterogeneous and morbid matter, and also to be altered from its too acid, or salt, or otherwise vitiated condition into a right temper, Vesicatories are always made use of in malignant Fevers; yea they are of excellent use in all putrid malignant Fevers and which are of a difficult Crisis: Therefore likewise in the *Scurvy*, *Leucophlegmatia*, *Green-sickness*, and also in every other *Cachymie* is this kind of Remedy very profitable. Moreover Vesicatories are applied with good effect not only for amending of the Blood itself; but also as often as it being depraved does impart its corruptions to other Parts, and so is the first cause of Diseases in the Head, Breast, Belly or Members, and raises their Paroxysms. Wherefore in *Head aches*, *Vertigo* or *sleepy Distempers* this is a common and vulgar Remedy; and no less in a *Catarrh*, and any *desfluxion* whether into the *Eyes*, *Nose*, *Palate* or *Lungs*; does every one, even of the vulgar, without advising with a Physician, prescribe *Cantharides* for himself as a revulsory Remedy. I confess that many times when I have been taken with a *cruel Cough*, with a great deal of thick *Phlegm* (to which I am originally subject) I have been helped by nothing more than by Vesicatories; and therefore I am wont, while the Disease is strong upon me, first to apply Blisters upon the *vertebrae* of the Neck, when those are healed up, then behind the Ears; and afterwards, if it shall seem needful upon the *Shoulder-blades*; for so the *serous illuaries*, issuing out of the too much loosened *compages* of the Blood, is derived from the Lungs; and moreover the mixture of the Blood, in regard its irregular Salts are destroyed by this means, does sooner recover its Crisis. 3. In respect of the *Humour* which is to be evacuated or derived out of the *genus nervosum* and the Brain itself, *Epispasticks*, as they are of very common use, so they are often wont to give the greatest relief in *sleepy*, *Convulsive* and *painful Diseases*. Was ever any taken with a *Lethargy*, *Apoplexy* or *Epilepsy*, but presently those about him claw'd his Skin off with *Cantharides*? I have successfully applied large Vesicatories in several Parts of the Body at once in strange *Convulsive motions*, and now and then changing their places have continued repeating of them above a Month. Moreover Pains fixt in the *membranous Parts* and cruelly tormenting are seldom cured without this administration: For sometimes the Humours and morbid Particles, which being deeply rooted yield not at all to Medicines working by Stool, Sweat, or Urine, seem to be pulled up by the roots by Vesicatories, which lay hold on the Disease with hands as it were.

III. Yet this Remedy, though very general, uses not to operate so easily and happily in some Diseases and Constitutions: For those who are subject to the Stone and to a frequent and grievous Strangury, scarce ever have them applied without prejudice; and therefore for the avoiding of a greater mischief let none that are so affected, use Vesicatories save in malignant Fevers, or acute Cephalick Pains. As to the various Temperaments and Constitutions of men, in respect whereof Vesicatories are more or less convenient or profitable, there

occurs this threefold remarkable difference hereupon. First, Some do almost always endure well the use of this Remedy, and the Blisters that are raised thereby in the Skin do pour forth an ichor plentiful enough without a dysurie or any great inflammation of the Blistered place, and then they heal up of their own accord: which effect succeeds only in a well temper'd Blood, namely where together with a moderate and rightly constituted salt and sulphur there is a sufficient quantity of Serum, whose *latex* departing easily and pretty plentifully from the rest of the Blood carries along with it the more acrimonious Particles of the Medicine which it has imbibed, and partly pours them forth by the blister'd place, and partly conveys them forth by the passages of Urine, without injuring them; and by this means are the aforesaid profitable effects produced in the mass of Blood. But secondly, this Medicine neither agrees nor works well with others, because it makes the Part to which it is applied look very red, or rather fleys it with cruel Pain and great Inflammation; and yet the Blisters that are raised there, though they torment the Patient awhile, yet pour they forth but very little or hardly any ichor; and besides, these to whom the blistering is so painful, are moreover cruelly tormented with a Strangury. This troublesome and also fruitless use of a Vesicatory happens often to Persons of an hot and choleric temper, whose Blood namely is endued with a plentiful Salt and Sulphur, with a moderate quantity of serum thoroughly soaked into one or other of them. Wherefore seeing its *latex*, which ought to carry away the acrimonious Particles of the Medicine, does neither easily nor plentifully (that it may presently wash them out) depart from the rest of the Blood, those Particles sticking still in the Skin, infect and as it were Poison the Blood itself that passes that way, and hindring it from its circulation cause it to be collected and to stagnate about the extremities of the Vessels (whence they are inflamed.) Moreover the serous *latex* being separated at length by the Kidneys, being little and acrimonious of itself, and moreover tinged with Particles from the Medicine, irritates the neck of the Bladder, and often corrodes it by its acrimony. Thirdly, The third case of Vesicatories (though more rare) is when the Blisters that are raised in the Skin, do forthwith pour out so vast a quantity of the serous Humour, that presently 'tis necessary to use with diligence Medicines that repell, and shut the mouths of the Vessels, or otherwise there is danger lest a dissolution of strength and failure of the Spirits should follow: I have known this to happen so constantly in some, that afterwards they were forced to abstain from the use of *Cantharides*, whatsoever need there was of them. The reason whereof seems to be, that the Blood being endued with too much salt and acrimonious serum, had a *compages* too apt to dissolve; wherefore the serous *latex* being too acrimonious and impetuous of itself, as soon as it is incited by the Particles of the Medicine which loosen the too easily dissolvable *compages* of the Blood, presently breaking forth impetuously out of the mass of Blood it issues out in a full stream as it were through the mouths of the Vessels gaping into the blistered Part.

IV. Besides this too great efflux of the serum, raised from the first application of a Vesicatory, the same happening sometimes late in malignant Fevers, and in others that have a bad or no Crisis, and continuing for some while, wholly consumes the morbid matter, and often delivers the Patient from the very jaws of Death. In such a case after that the Blisters have on the first days poured forth little or no ichor, Nature at length attempting a Crisis this way, there runs abundance of serous matter out of the same; and so it continues to

Z Z Z Z

run for many days, yea sometimes weeks, till the Patient that was before esteemed deplorable, recovers his health intirely. The Blisters running thus plentifully, as it is not easie, so neither is it safe to close them, before the whole *minera* of the Disease be consumed. One recovering very difficultly from a malignant Fever, having in divers Parts of his Body blistered places which daily discharged a great deal of ichor, after a while applied strong repercussives to them all, and so presently stopt their running. But scarce had they been stopt two days, but relapsing he was presently seized with a languor and frequent failing of his Spirits, with a cold Sweat and a small and weak Pulse: and being not relievable by any Medicines (*viz.* Cordials) died within three days, the reason whereof seems to be, that the malignant matter being suddenly driven back, had fallen upon the Cardiac Nerves, whose action being thereby hindered, the Vital function soon failed.

Idem.

Capivac.
Pract. l. 3.
c. 19.Th. Bartholin.
cent. 4.
Epist. 54.

V. When we apply *Cantharides* outwardly to raise Blisters, we only use the belly, rejecting the wings and feet, for these hinder the belly from operating so strongly as it would; nor is there any danger that the external Parts of the Body should be hurt by applying only the belly. But if we give them inwardly to provoke Urine, we give the belly indeed; but lest this should do harm, we mix with it the wings and feet, which Parts hinder the belly from hurting so much. ¶ When the Skin is to be ulcerated with blisters, the extreme parts of the *Cantharides* are to be cast away, wherein there lies hid a more benign quality.

VI. Let young Physicians beware, that in prescribing Remedies that have *Cantharides* in them, they offend not in the quantity, nor always follow the prescriptions of others: for they commonly commit an error in the Dose, when for a few Ounces of Leaven and the other Simples which the Vesicatory is made up of, they prescribe some Drachms, yea sometimes an Ounce and an half of the Powder of *Cantharides*; and because *Cantharides* are so light that fifty hardly weigh a Drachm, 'tis easie to mistake in the weight. For this reason I commonly prescribe Vesicatories thus: Take of sower Leaven half an Ounce, of *Cantharides* finely powder'd to the number of Six, mix them in a Mortar, adding a little Betony water to make it up into a Cataplasim.

VII. One having a swelling in his Knee from a tough and cold matter, a Barber applies to it a Cataplasim of Leaven and *Cantharides*, and blisters all the Knee: Hereupon amongst other Symptoms followed so great an heat of Urine, that he could not make a drop without torment and crying out (now his Urine came forth by drops and bloody.) The Cataplasim being taken off, the heat of Urine and other Symptoms remitted a little. In inveterate Diseases, as the *Sciatica*, it may be thus prepared. Take of sower Leaven three Ounces, of the Powder of *Euphorbium* a Scruple, of long Pepper and *Pyrethrum* (or bastard Pellitory) of each two Scruples, of *Cantharides* to the number of Sixty, mix them, and make a Cataplasim with *aqua vite* as much as suffices. If *Cantharides* be applied on this manner, they are void of all danger, even though they be laid on Parts that are nearer to the Bladder.

cent. 3.
obf. 88.

VIII. A young Man of two and twenty being inclinable to melancholy, is taken with a malignant Fever: Four Vesicatories are laid on his Hips and Thighs, which by attracting poisonous Humours caused a deadly Gangrene in his Thighs within two days. ¶ The blistering Plaster of the Shops was prescribed to a Girl two years and an half old, ill of a malignant Fever; to increase the vertue whereof the Apothecary sprinkled a good quantity of the Powder of *Cantharides* upon it, by

which the Skin was burnt up, and the next day all the Part was gangren'd. For the cure whereof, having first us'd Scarifications, the Part was fomented with *aqua vite*, and then a Liniment was applied of *ungu. Egyptiacum* dissolved in *aqua vite*: Within three dayes the Eschar was separated, and the Ulcer that remained was cured by the following Ointment: Take of the fat of a Bullocks Kidney one Ounce, of Litharge prepared and red Lead of each a Scruple, of the Oil of Roses as much as suffices to make an Ointment.

River. cent. 2.
obf. 86.

IX. One complained to me of a Pain raised by a Vesicatory, but I could ease him with no Anodyne; Dr. N. asswaged the Pain with only Water and Oil. I eased a poor Woman tortured with the fire of a Vesicatory, thus: Take of the inner and green bark of a branch of Elder scrap'd off with a knife, an handful; boil it in sweet Oil with a little water to the consumption of the water: strain it, and add to the liquor a little wax, and it is an excellent Ointment.

P. Pa. hequid
ad River.
obf. com. 12.

X. Though Vesicatories and Sinapisms heat the external Part to which they are applied, yet that heat penetrates not to the internal Parts: which those have not understood who have thought that Vesicatories are not to be used in malignant Fevers with raving. Galen himself (2. de diff. feb. tit. ult.) says, That the next Parts to which Sinapisms are applied, are heated indeed, but not the remote, contrary to those who say that Vesicatories heat the inner viscera.

Sanctor. lib.
de rem. inv.
c. 16.

XI. Whether is it good to add Vinegar to Vesicatories, as is commonly done? It makes for the negative, that Vinegar fixes the saline acrimonious Parts and infringes the acrimony, as we use Mustard for sawce that has first been steeped in Vinegar, which without so doing would be too biting: Onions, Garlick, Rhadish, Aron are made mild by Vinegar. From whence Martian (*Comin Hippoc. p. 282.*) concludes, not without reason, in the negative. Add that Vinegar does repell and cool, which is contrary to the indication, especially when there is malignity withal. The matter may be easily decided, if we have regard both to the moderate quantity of Vinegar, and the form in which it is administred: for thus by its acrimony it increases the vertue of the Vesicatory, and the body of the *Cantharides* being dispersed through the Leaven, it cannot so infringe their vertue, but that it yields to the force of its corrective; so that in this form a little Vinegar, though it partly mitigate the force of the Medicine, yet it does no harm. But those Vesicatories are the best of all, when the *Cantharides* are made up into a Paste with Wax and Turpentine, and used Plasterwise; or we may use *Horstius's* blistering Plaster.

Wedel. de
f. m. fac. p. 99.

XII. I raise Blisters with Cupping-glasses only; which invention of mine I here communicate. I take a Cupping glass with a wide mouth, and firing it with tow, as the manner is, I set it on where I have a mind: when it has stuck on for a quarter of an hour, I take it off, and set on a new one with as much flame as I can: a little after in the younger and more fleshy (more slowly in old men, or such as have a thick Skin) there arise Blisters, hardly so big as little pins heads; all which within an hour leaping into one, there arises a Blister as large as the mouth of the Cupping glass. Then if the Cupping-glass have not an hole stopt with wax, (which being perforated with a Needle the wind issues out and the Glass falls off of its own accord) I use to hit it with a knife and break it; otherwise if you endeavour to pull it off with your hand, it tears the Blister and causes great pain. A great quantity of water being always drained out this way, I tie upon it a Colewort-leaf or the lean flesh of an Oxe's muscle, so long till by its sinking it shew that it ought to be taken off. Blisters are raised this way most certainly within the

H. 3b Heers
Obf. 21.

the space of an hour, and that without any prejudice; whereas all other Vescatories do often fail us after many hours waiting, and either prolong the Disease, or make it stubborn, or even unconquerable.

XIII. He that shall administer Vescatories rightly, shall generally obtain the victory over the most difficult Diseases; especially over those that are fed by a flux of Humours, and chiefly if the Humours be ferous and acrimonious (the Greeks call them Ichors) because these flow the most conveniently through the opened pores of the Skin. Wherefore if there be a rebellious and stubborn Disease either in the Eyes, or Nose, or adjoining Parts, amongst all other Remedies which provident Physicians have been wont to make use of, I have scarce found any better than this. So if there be bad eruptions of some eroding Humour in the papes, Stones, Cod, or Yard, which it would be dangerous to permit to settle there, an efflux may conveniently be given to that Humour by applying Vescatories upon the Hips, as being more vile Parts and more able to endure any thing. Moreover if the Neck, or Breasts, or Navel, or Belly, or any other parts labour under any bad Ulcer, or Swelling that threatens an Ulcer, we must endeavour to avert the danger by applying Vescatories upon or as near them as we can where the part is most fleshy. And that I may give thee one rule that is most general, all loose and weak parts, that are of greater dignity, which there is fear may be seized upon by some fearful Malady, will be relieved by this sort of Remedy, as experience testifies. Besides if some Seeds of the Pestilence do infect some parts of the Body, especially the more noble, 'tis reasonable to hope they may be defended this way. In general, they attract and revell, by inducing a pain upon the part, both while the pain is in exciting, and afterwards, and cause an actual evacuation of the Humour that flows into the defended part. For a Vescatorie is not only a Revulsory Medicine, but an excellent Evacuatory; so that when there remains some old painful Tumour after the Body is evacuated, and the Physician has prescribed other Remedies in vain, this Remedy should be tried at last, as being wont sometimes to relieve wonderfully. I remember a young Man being so pained in his Knee from the French POX, that his Leg was drawn up and he could not go, having made use of this Remedy was forthwith freed both from the pain and contraction.

Severin.
Chir. Trim.
P. 55.

XIV. About twenty years ago I was sent for to a Patient two Leagues from Mafcon: It was the Baron of Pierreclos, who lost all his senses of a sudden as he was about to make Confession and receive the Sacrament. I met with Five Physicians there, my self making the Sixth. We entred upon consultation, and from what they proposed I could gather, that they had omitted no kind of Remedy that might conquer the Disease, and relieve the Brain from its blockade: They were the more earnest and intent upon the cure, out of an opinion, that he could not be received to bliss unless provision had been made for his Soul by the aforesaid Confession and Sacrament. When it came to my turn to speak, observing that the Remedies commonly made use of had been administered in vain, I offer'd this, namely to shave his Head and apply a Vescatory Cataplasma all over it; hoping that by the efficacy of this Topical Remedy the ferous Humours, that in my opinion overflow'd the whole substance of the Brain, might be drawn outward, and so the Brain might either be freed therefrom, or however less burthen'd with them. The case seeming desperate, the rest gave their consent; and there was a Vescatory applied, which had the hoped for event: for by vertue of this Remedy the Patient recovered his Speech, Judgment, Memory, Hearing, and all his other Senses, except his

Sight. The kindred and Friends of the Patient rejoycing, and magnifying my skill, and admiring me as a Miracle-worker, the Priest received his Confession, and gave him the Eucharist: He also made his Will; but after a while, as I foretold; he fell into his former drouiness, and the next day slept quietly away. This Story was communicated to me by Carolus Sponius, a Physician of Lyons.

Vomitories.

I. Vomiting is very profitable for those who have bad habits of Body, when it is easie and moderate, and it is the most excellent of all Purgations; for it drains the noxious Humours, sincere and without mixture, out of their very fountains, and evacuates all that filthiness which sticks in the cavity of the Stomach or its Coats. It purges chiefly out of the Membranes of the *præcordia*, out of the hollow part of the Liver and Spleen, and drains superfluous Humours of all sorts out of the *Pancreas*, which otherwise neither *hiera*, nor any other though the most vehement Medicine could hurry into the Guts: For the passages from these parts into the Stomach are short and ready, and more direct than into the Guts, so that the Humours pass readily through them by Vomit. Now though it drains out of the inner parts, yet it relieves the Head and the rest of the Body by consequence. Wherefore it is profitable in all those Diseases that have taken their rise from the impurity of the *præcordia*, for a weak appetite, often vomiting, loathing of meat, puffing up of the Stomach and *præcordia*, Jaundise and Cachexie, Agues, Megrim, Vertigo, Falling-Sickness, and all Diseases of the Head that are contracted by a Sympathy with the *præcordia*, and which the impurity spread from the *præcordia* into the rest of the Body hath produced.

Fernel. m. m.
l. 3. c. 3.

II. Though Vomits be of notable efficacy, yet they ought not to be taken by all without distinction: For in some the tone of the Stomach is too loose and weak, and their constitution so tender, that they make the Spirits presently to quail, and dissolve the strength. Some Mens *viscera* also are too pertinaciously sensible, and though they be hard to Vomit, yet when they have once begun, they do not easily give over, but by a frequent straining to Vomit, their strength is very much dejected, and they oft fall into a swoon.

Willis
Pharm. rat.
p. m. 57.

III. I think that opinion to be untrue and to lean on very trifling foundations, which determines that some Vomitories act upon choler, others upon phlegm, and others upon Melancholy, and drain forth this or that Humour separated from the rest, and alone as it were. And the reason why a vicious and as it were phlegmatick matter is sometimes chiefly expelled, is, because the filth of the Stomach alone almost is thrown up, the receptacles of the choler being not shaken by the straining: But when the choler Vessels are milked out, the excretion becomes choleric for the greatest part. The vomiting of a black Humour for the most part depends on the tincture of the Medicine; for it is that which colours the matter which is cast forth, with a vitriolick blackness.

Willis
ibid. p. 55.

Sylvius de le Boë (m. l. 2. c. 10.) is of a contrary opinion, appealing to experience. I observe, says he, that some Vomitories do chiefly expell phlegm, others choler, and others any Humours indifferently, which though it have been observed by few, yet ought it to have been observed: Thus 1. Peach flowers do expell bilious and serous Humours even by vomit. 2. *Asarum* also evacuates choler upwards. 3. Turbith casts glutinous phlegm up by Vomit. 4. The seed of *Carthamus* brings up both phlegm and water. 5. *Elaeterium* purges water and choler both upward and downward. 6. The Root, Bark, green tops and flowers of both *Dwarfelder* and *Elder* bring up water by Vomit. 7. Gummi Gotic water and choler. Add to these the root of *Zalap* which expells water by vomit as well as by stool.

IV. As to the choice of Emeticks, the chief reason of their difference is, that the milder be given in some Diseases, such as may disturb nothing beyond the Stomach, and may gently bring forth those

things only that float in its cavity or stick to its coats: but in other Diseases the stronger are more convenient, that the convulsion being imparted also to other *viscera*, whatsoever excrementitious thing stagnates therein, or is collected any where, may be moved out of its lurking place. Now this evacuation as it is more violent than that by stool, so if the strength bear it well, it uses in some Diseases to profit more at once than ten Purges: for by this means the weighty phlegm that sticks close to the folds of the Stomach, which all Purgers would slide by, is swept out with a Broom as it were. Moreover the neighbouring parts, the *Pancreas*, Mesentery, Spleen and Liver it self are strongly shaken, so that the obstructions bred therein, as also whatsoever stagnations of the Blood and Humours, are easily removed by this kind of Remedy: the preternatural ferments bred any where in the Body, and the more recondite Seeds of Diseases, are seldom extirpated without Vomitories; but the use of Emeticks is found chiefly profitable in the Diseases of the Brain and *genus nervosum*. For by this sort of Remedy not only is the filth of the Stomach and Bowels, which defiles the chyle and Blood, cleansed away in great plenty; but also the glandules of the *viscera*, which are the Emetories of the Blood and nervous juice, are milked, the choler-vessels and other receptacles of the excrements are plentifully evacuated; so that the same being emptied do the more readily receive the Serum and other filthinesses and superfluities of both Humours, that otherwise would be apt to overflow into the Head. Besides all this, seeing there are innumerable little mouths of Arteries gaping under the downy crust into the Stomach, these being notably twitched by the Emetick, do pour forth all sorts of vitious and malignant Humours in the Blood, to be evacuated by Vomit: and for this reason chiefly is it that Herculean or stubborn Diseases are well cured by Emeticks, and hardly at all without them: for these Medicines being of an active and untameable Nature, do not only by twitching the Arteries squeeze the superfluous Humours out of the mass of Blood, but also by entering into the Veins, innumerable whereof gape into the Stomach, do fuse the Blood, and do precipitate and cause to be separated its serosities and other recrements.

Willis pharm.
mac. rat. p.
55.

V. Custom and facility seem to me to be of the greatest moment in raising a Vomit: for if these be wanting, 'tis of far greater difficulty to be purged by vomit, than by stool; though not of less profit, yea of far greater, though purging by stool be safer. Hence it comes to pass, that prudent Physicians, and such as take most care to cure safely, are commonly content with purging by stool: but Mountebanks, who slighting the dangers of the sick, would for Honour and Glories sake do some great thing by hap hazard, undertake the most violent vomitings: as for my self, though I would never design to purge by stool and vomit much at once, because that is an accident of a very bad Disease, namely the *cholera morbus*; yet I do not dislike that temperate purgations of both kinds, namely, both vomiting and dejection, should ensue upon the taking of a Medicine, nay I hope well therefrom, both thick and thin Humours being evacuated and purged as well upwards as downwards.

Vallef. m. m.
l. 2. c. 5.

VI. Yea sometimes Vomitories may be joined with Sudorifics, for there is no harm in their being taken and operating together, seeing the motions by vomit and sweat are not contrary to one another, but only diverse. For the pipe or chanel of the Guts, together with the Stomach and Gullet, are unskilfully and unjustly esteemed the centre of mans Body, and the pores of the Skin its circumference: For if any part might be said to be its centre, there is the greatest reason the Heart should be so esteemed, from which the Blood is carried into all the

the parts; as likewise the several parts for its circumference, seeing the Blood is carried back from them to the Heart, and that according to the circular motion of the Blood. Now if the Heart be determin'd to be the centre of mans Body, then the pipe of the Guts, through which the Gall-bladder and Pancreas discharge themselves, and the mouth it self, into which and by which the Salival glands unload themselves, and sometimes the Stomach it self with the small Guts, are no less to be esteem'd for its circumference, than the external Skin, through which the sweat is expelled, and the Piss-Bladder, by which the Urine is evacuated. Reason does not only argue this to be probable and likely, but experience proves it to be true, which hath more than once assured others as well as my self, from the excellent success and great benefit of the Patients, that Humours offending in the Body are expelled at the same time and by the same Medicine, both by vomit, stool, sweat and Urine. Which experience hath taught to be profitable in not a few distempers, such experience, I mean, as is certain and consenting to solid and sound reason: And that the same may be safely and with good success done in the Plague, I make no doubt. See Book 6. under the Title of a Pestilential Fever.

Sylv. Append. Tract. 3. §. 594.

VII. Let any should think that Cholera only does affect to pass upwards by Vomit, daily experience teacheth us, that both inspid and salt and acid water, as well thin as thick, yea tough phlegm is vomited up by many of their own accord in abundance: which where it is observed to be done, if nothing gain say, 'tis convenient to follow the said guidance of Nature, that is, to promote the motion of the Humours that is spontaneously made upwards. Now I reckon that the Humours are moved upwards spontaneously, that is by Nature, as often as being carried through the Pancreatick and Biliarie duct into the small Gut, and meeting with the phlegm produced chiefly from the spittle that is continually swallowed, or with the aliments, Medicines or poisons that are taken in and are sliding out of the Stomach through the pylorus, they raise an effervescence as well with one another as with these, and that such as through which they are driven upwards to the Stomach, in some and that either a less or larger part, or altogether.

idem tract. 6. §. 163.

VIII. Let such Vomits as are strong, be given especially to delicate Bodies and weak Stomachs, after meal: But if you would have a plentiful evacuation in such as are more strong, give them on an empty Stomach, especially Antimonials, whose vertue is soon dulled. Prepare the more tough Humours by Incisers, Openers, Oxymel, with some Syrup made acid by the Spirit of Vitriol or Sulphur, by bathing, by long fomentation of the Hypochondres for many days; and after give a Vomit: After every Vomiting give some fat broth: In vomiting foment the Stomach with some relaxing fomentation, and afterwards with a strengthening one: At night, if there be need, let Laudanum be given; the next day, some Conserve, Tablets, or strengthening Wine.

Ex schedis Dom. Turqueti de Mayerne.

IX. The Ancients used Vomits frequently, and purging by stool but seldom: and Hippocrates for prevention never used purging by stool, but always by Vomit, as appears from 3. de dieta, and 1. de insomni. For because it cannot be so manifest what Humour abounds most whilst no Disease does as yet appear, he therefore purges by Vomit, whereby not only that Humour which is agreeable to the Medicine is brought forth, but also any other whatever which happens to abound in the Body. ¶ Because the Stomach gives to all and receives from all, therefore does Hippocrates use vomiting for prevention whilst a Disease of any part is imminent.

Prosp. Martian. com. in v. 153. l. de nat. hom. idem com. in v. 136. l. de insomni.

X. Some refuse Vomitories, because we are not so accustomed to them as the Ancients; as if in our age no Disease had its Crisis by Vomit; or there were not to be found men who vomit very easily both of their own accord and by Medicines: whence we daily observe that many sick persons, after they have been physick'd a long time in vain by rational Physicians, have been wholly cured of most stubborn Diseases by taking Antimony or the like violent Remedy given by some Empirick: nor are men in more danger by the use of these than by our Benedilla's commonly so called; which though they be gentle and easie, yet are even they observed sometimes to cause deadly superpurgations: For the harms that proceed from a Medicine, depend not altogether on its strength, but its unfit use: whence a Physician does no less harm by giving a weak Medicine to him that needs a strong one, than if he gave a strong one and perhaps one that works upwards, to him that has need of one that is gentle and works by stool. Yet I deny not that purgings upwards are far more uneasie in the very act of Vomiting than purgings downwards; so that the Patients think themselves even ready to dye: yet when the evacuation is over, the clean contrary follows; seeing those that have been purged by Vomit, are presently better, and are made more chearful and ready to perform all operations; they are not thirsty, they have a good appetite, and are very quickly recruited: the contrary whereto happens to those who have been purged by stool. Nevertheless Physicians now a dayes preferring pleasantness before all things, without any regard to the Disease, or season, or any thing, always prescribe purging by stool, to the great prejudice of art.

idem com. in v. 231. l. 3. de morb.

XI. We must take heed of purging too Acrimonious or corrupt Humours by vomit: for the sense and excellency of the mouth of the Stomach can hardly endure the contact of the vitious matter, unless it be first very well prepared, and mixt with other lenient and moist Medicines.

Mercat. de ind. med. l. 1. c. 5.

XII. Vomitories require their just and exact dose; for being given too sparingly they lose their vertue and purge by stool. It is a sign of a just dose, if yellow and green stuff be vomited up; and it is a sign of too small a dose, if only waterish and white Humours be cast up. Now those colours were not in the Humours before, but are brought upon them by the Medicines: Thus children vomit up the milk colour'd, whereas it was white before.

Walaeus

XIII. What some affirm, that a Vomit taken in never so great a dose, works no more strongly, than if it were taken only in a moderate quantity, is wholly untrue; and an experiment thereof is not to be made without danger: for if there be more particles of the Medicine, they will also imbue the more fibres, and entering deeper into them will provoke them the more grievously, so that more cruel and frequent convulsions of the Stomach must necessarily follow.

Willis phar. p. m. 54.

XIV. It is not safe to agitate the Stomach with violent vomiting Medicines: nor is it good to use ones self to them, seeing no wise man will make a piss-pot of a pot for cookery. 'Tis better to preserve this part diligently and to strengthen its tone, than to dissolve it by Vomiting; unless Nature affect that way, and there be an easiness to vomit, and the preparation of the Ancients have been used. ¶ Celsus (lib. 2. c. 13.) says that Vomiting does not always good to the sick, but always harm to the well; which is true especially in our age, wherein men are not much used to vomiting: for often vomiting is a cause why Nature uses to send naughty Humours to the Stomach: for though they advise to vomit after dinner, yet seeing that motion is violent, it always draws something. Adhereto that the concoctive faculty is

Riolan. Enchir. Anat. lib. 2. c. 232

A a a a a

rendered

rendred weaker, and the tone of the *villi* or fibres of the Stomach becomes more rare and thin. Also Nature being accustomed to this evacuation in health, when she is hurt by a Disease she is very apt to fall into it, whence the retentive faculty is vitiated: besides that it prejudices the Head, Lungs and Liver.

Rubeus in
Celsi cit. loc.

XV. Those act unskilfully, that I say not impiously, who after many Medicines have been administered, when the Patients are ready to die and their strength spent, use Vomits as the last Remedies, which suffocate the life that remains and hasten death. But you will say, Mountebanks do thus, and have good success? I answer, If you took account of the Patients with whom they have had bad success, you will find an hundred dead, for two (robust) Persons that were preserved, who escaped by the help of Fate, and not of this Medicine. The more wary Empiricks when they are called to such Patients, use to pronounce great danger of life; and therefore they warily administer *aurum potabile*, or some other recruiter of strength, till Nature resting from all perturbation recover her self a little, and then they take the opportunity of giving a gentle Vomit, which brings forth ferous Humours or the like indifferently.

Riolan En-
chir. Anat.
l. 2. c. 23.

XVI. Hippocrates 4. aph. 4. bids us Physick the upper venters rather in the Summer, and the lower in Winter. And 6. aph. 6. says, that the lean and those that Vomit easily are to be purged upwards, avoiding the Winter: Reason consents, because the Phlegmatick Humour abounding in the Winter, being naturally heavy, inclines downward, therefore it is to be purged downward, according to the aph. *Whither Nature inclines*, &c. He hath writ the contrary 3. de diata n. 3. where prescribing a Winter diet, *We must also*, sayes he, *use Vomiting thrice a Month, if the Patients be moist, but if dry, twice, after meals of several sorts of meat.* This he confirms lib. de sal. diata: 'Tis profitable to Vomit the Six Winter Months, &c. to which Celsus subscribes (lib. 1. cap. 3.) Solve these things, by saying that Hippocrates did not utter that opinion in the Aphorism simply, but by adding the particle *μᾶλλον*, rather: as though he did not deny but that in the Summer also we might purge downwards, and in the Winter upwards: Or say, If universal purgation be meant, as that which is made by *Hellebore*, common with Hippocrates, it ought in the Summer to be made upwards, and in the Winter downwards: If a particular, it ought to be made by Vomit in the Winter, and by Stool in the Summer: According to Galen's comment on the foresaid aphorism: *Therefore because Phlegm is generated in the Belly in Winter*, he advises us to evacuate it by Vomit, and to revel downwards the Choler that swims a top in Summer. And yet if you desire to purge the whole Body, you shall purge it upwards in the Summer, and downwards in the Winter, as it is written in the Aphorism: for those things which are superfluous, are cured by purgation, which must be made by those wayes whereto the Humours tend; for these are to be drawn through fit places that way they incline; but when you would hinder Humours from increasing, 'tis good to draw them back by contrary places.

Sinibald.
Antiph. l. 3.

XVII. We must Vomit the *Fat* in one manner, and the *Lean* in another: for the former, because the Humours are sluggish and unapt for motion, ought not to be Vomited but when they are fasting, and after considerable walking or other exercise; for so the Phlegm, which is naturally clammy and tough, waxing hot, is fused and made more apt for exclusion: On the contrary the lean, as not at all abounding with Humours, if they be to be Vomited, it ought to be done after Meal when we have eat several sorts of meat according to Hippocrates's precept l. de sal. diata, and 3. de diata n. 4.

Idem Anti-
ph. l. 3.

XVIII. 'Tis hurtful to use Alteratives and Purgatives before Vomiting, for by these the Guts are spoiled of their clammy Mucilage, so that the Vomit will corrode their substance and cause great griping. ¶ Alteratives indeed may be premised, but not of absolute necessity; for the Vomitories themselves may fuse the Humours by their proper vertue.

Walaeus p.
57.

Idem p. 56.

XIX. If the condition of the Patient and the Disease require both Bleeding and Vomiting, 'tis most safe that Bleeding should precede: for otherwise while the Vessels are distended with Blood, there is danger lest from the violent strainings to Vomit either the Vessels of the Lungs should be broken, or the Brain should be hurt, the Blood being poured thither with violence and extravasated, and so the Patient die Apoplectick.

Sydenham
tract. de
febr.

XX. 'Tis profitable to mix the Humours contained in the Stomach with sundry sorts of meat, both that it may the more closely embrace them on every side, and also that Nature may the more easily expel them when they are mixed with the Victuals: but the Victuals ought not to be of any kind indifferently, but salt, bitter, acrimonious, inciding, attenuating and turgent, which, as Galen 3. de usu part. advises, have a bilious nature, and execute the office of Choler, namely absterge and cleanse the Belly; for all these, besides that they conduce to expulsion, prepare the Humours themselves also to the same. But the clean contrary ought to be done in those whose Stomachs abound with crudities, for then it is sufficient to use vomiting potions without eating, which is suspected and often very hurtful in crude Stomachs.

Mercat. de
Ind. Med.
c. 5.

XXI. We must not Sleep upon Vomits, especially when the Bodies are Cholerick, lest the Choler be carried into the Brain in Sleeping: yet when the Patient has seem'd to Vomit enough, Sleep may be allowed.

Hartman. in
Crolium.

XXII. When the Patient has taken a Vomit, let him drink after it Beer or fat Broth, for so he will Vomit the easilier.

Walaeus m.
m. p. 60.

XXIII. He that rests and lies in his Bed, hardly Vomits half so much as he that stirs up and down.

Idem.

XXIV. After Vomiting give sweet Milk and white Bread, for this doth again demulce the Gullet and Stomach.

Idem.

XXV. All Vomitories are bad given in substance.

Idem.

XXVI. Let us not be moved by the authority of grave Physicians who dread the use of Antimony, whereas in the mean time they make use of *Asarum* that is no less strong and violent: for whosoever uses *Asarum* to cause Vomiting, may also use Antimony, seeing it is both a more grateful Remedy, and also turns the Stomach with less danger and far more easily, and attracts from the more inward parts, especially if the infusion be rather taken than the substance; for then its vertue penetrates deeper, nor does it give so great molestation to the Stomach, and in some, yea very often, it works also by Stool: And if it be rightly and duly prepared, any one may use it safer and with less danger than *Asarum*, whatsoever some clamour to the contrary, who fear all things that are safe. White Vitriol is stronger than Antimony, and Tobacco is stronger than either, exagitating mightily and beyond measure: yet I have known many use it with good success both in infusion and substance.

Primicof. l.
2. de febr.
c. ult.

¶ Antimony is the most excellent of all Emetics, and weakens least of all: Yet its substance ought not to be given, but only its infusion, which let it not be prepared of the Glass, but only of *Crocus Metallorum* that is very pure: for this is the safest of all the preparations of Antimony, & breaths a kind of Balsamick vertue upon the viscera after its operation. Other Vomitories which those who are, and will be called Galenists, use ordinarily, made

made of *Afarum*, the flowers of Broom, white Hel-lebore and other such like, besides that they are ungrateful and indiscretely compounded; they are far worse and stronger than Antimony; as I have a thousand times found by Experience.

Idem l. 3. c. 2.

¶ Amongst Vomitories I here prefer *Antimonials* before all the rest, both because they do most happily evacuate all Humours promiscuously; and also because they are most friendly to Humane Nature, in a peculiar manner reducing by degrees all the Humours in a man to the most laudable state; which vertue whether it be to be met with in other things, I make a question; that it is in Antimony, I know. Yet we must take heed of administering them in too great a quantity, &c. For being rightly prepared and used in a less quantity they hurt no body, as I can testify from a thousand Tryals: but in such case they always profit, either by amending the noxious Humours in the Body, or by further preparing them for the Purgation that is to follow after.

Fr. Sylv.
Pract. l. 1.
c. 23.

XXVII. The infusion of Antimony or of its Glass in distilled Vinegar hath that benefit, that the very substance of the Antimony is fretted off by the acrimony of the Vinegar, which being fretted off sinks to the bottom: Now if such infusion be prepared for several Doses, the first that are poured off will work but little; but when you come to the bottom, if you think to give the like quantity as you did before, you should cause the Patient to be either intolerably griped, or even to die.

Walzusp. 59.

XXVIII. Spanish wine extracts but little of its vertue; but French wine or Rhenish a great deal, because they incline to an acrimony: Red wine also extracts better than white. Spirit of Wine extracts nothing from Antimony.

XXIX. 'Tis in vain to prescribe the Dose of the infusion of *Crocus metallorum*; for the stress lies in the quality of the Liquor. No recipient receives by the measure of the impressor; but by the measure of its own receptivity.

Idem.

XXX. *Antimony* prepared, or *Crocus metallorum* are prescribed to four or eight Grains; yet we seldom go so high as this last Dose, nor do we use it at all but in infusion.

Idem.

XXXI. Note that *Aromata* (or Spices) are not prudently added in an infusion of *Antimony* for Corrections sake, seeing by this means the endeavour both of Nature and of the Medicine is inverted. For if that Infusion be given for this reason, to evacuate vitious Humours both out of the Stomach and neighbouring Parts, it ought also to exert its operation upwards: And why would we weaken its vomiting vertue by strengthening the Stomach with Spices? while on one side Nature is stimulated to expulsion, she is on the other held bound with fetters as it were, and hindered from doing that which she intends to do; and so she is interrupted in her operation and becomes doubtful. If we will strengthen the Stomach, let us do it after the vitious Humours are discharged out of it by vomit: And therefore the poisonous quality of the glass of Antimony is better corrected by Nitre alone, as *
Zwelfer admonishes.

In Append.
ed animadv.

XXXII. The glass of Antimony uses to work strongly, being for the greatest part, or altogether deprived of its Sulphur in the Preparation: the Dose of the Powder is from four Grains to six; of the infusion in Wine from six Drachms to ten. The flowers of Antimony are a fiercely vomiting Medicine, because in its preparation the saline and sulphureous Particles ascend (having shaken off the watry and earthy) and are combined together; so that the mineral Body being very much unlocked, and the most active Corpuscles (the more dull which blunt these, being laid aside) joined together, the Dose is only from two Grains to four. *Crocus metallorum* works kindly enough and is a very usual Emetick: it is given in substance from three Grains to five;

the infusion of it in Wine from half an Ounce to an Ounce and half. The Sulphur of Antimony works more kindly and gently than any other Preparation of Antimony: the Dose of it is from five Grains to ten. *Mercurius vitæ* contains no Mercury in it, because being deprived of its congelative Salts it resumes its former species of Quick silver (It is made of equal quantities of choice Antimony and Mercury sublimated.)

Willis
Pharm. rat.
p. 65.

XXXIII. *Angelus Sala's* Emetick Syrup, called by others *Oxyssacharum vomitivum*, doth excellently clear the Stomach that is loaded with thick Phlegm. *Gregorius Horstius* tom. 2. p. 483. gave a Drachm of it to an Asthmatick Woman, whereby she was cured by vomiting up some pounds of thick Phlegm. Less judicious Physicians might be afraid of choaking the Patient, as if the Passages appointed for respiration would be made straiter in vomiting; but viscous Nature grants space for respiration betwixt the Vomits: The same is to be observed in a suffocating Catarrh. I use that Syrup frequently, and should desire no alteration in it unless that the taste of the Vinegar might be somewhat milder, of which some Patients complain: therefore I often add a little of the Julap of Roses or the Syrup of Cinnamon. ¶ *Sala* gives it from two Drachms to six: *Horstius* observed that in the adult it may safely be given to an Ounce. See his Seventh Book of Observations, Obs. 30.

Hoff. Her-
cul. Med.
p. 118.

XXXIV. I remember that I have read that white Vitriol was prescribed by *Heurnius* to two Grains: but that does nothing; it must be taken to half a Scruple, twelve or sixteen Grains.

Walzed

XXXV. If much filth load the Bowels, especially the Stomach, gentle Vomits with *aqua benedicta* are to be prescribed: for it has this peculiar vertue, that it not only throws out the filth, but also inflames the Stomach to Concoction; whence after the use of *aqua benedicta*, we always observe the appetite, even though buried as it were for a long time, to be revoked and increased.

Hartman, Pr.
chym. p. 184.

XXXVI. When a Disease yields not to the vertue of Antimony, white Hellebore is called in to assist, if the Patient be strong. *Herophilus* compared it to a valiant Captain, for having mustered all within he said it marches first out: that therefore the Ancients mistook in giving it in too small a Dose, seeing the more of it is given, the sooner it comes forth: But then it must be accurately prepared, seeing, as *Oribasius* witnesses, heretofore many have been kill'd by it, because they knew not how to prepare it.

Heurn. Meth.
med. lib. 2.
c. 21. where
he delivers
divers Pre-
parations of
it (amongst
which he ex-
tols the
Quary) and
divers cau-
tions in giv-
ing it.

XXXVII. The same thing almost is to be corrected in *Quercetan's* Oxyssel of Tabaco, where also the quantity of the Vinegar is too great; and of the Tabaco too little for the intention of raising a Vomit. Therefore I think that the weight of the Tabaco ought to be doubled. The Dose is two or three Spoonfuls by it self, or with some pectoral Decoction. It is approved of by *Horstius*, &c.

Hoff.

XXXVIII. In the giving of Vomits with Preparations of Vitriol, we must carefully take heed of an Asthma and other Diseases of the Breast.

Beguini tyro-
cin. l. 2. c. 17.

XXXIX. Amongst Vomitories I prefer Antimonials before all others, as often as Cholera chiefly offends; where Phlegm abounds, I commend *Mercurialis*, either alone or mixt with other things, because they do above all other bring forth tough Phlegm, and moreover incite it.

Sylv. Ap-
pend. tract.
8. § 160.

XL. Among the stronger Vomitories we use now adays, is the salt of Vitriol rightly prepared, of Vitriol rightly calcin'd: For if the calcin'd Vitriol acquire not a dull purple colour, you shall extract nothing but a Vitriol of the same colour, and shall obtain no white Salt: But if you exceed, and so by calcining the Vitriol too much spoil it of its acid Spirits, you shall not get much of that Salt out of it which will vomit. *Sal Martis* rightly prepared of *Vitriolum Martis* has a better vertue; *Quercetan* (in tetrad:

A a a a a a

af

off. capit.) bestows on it the name of a celestial Manna. A. Sala in his ternary of Vomitories commends it to the Skies. Yet note from Zwelfer (in Append. ad Animadu. p. m. 7.) that this is improperly called a Salt, seeing it is nothing but the substance it self of the Vitriol separated from all impurities and metallick substance, seeing 'tis commonly prepared without any preceding calcination, only by repeated Solutions, Filtrations and Coagulations, whence it ought to be called, *white Vitriol vomitive*, and not *salt of Vitriol*.

Frid. Hof-
man. m. m.
p. 112.

Idem l. i. c. 9. lity.

XLII. The *glass of Antimony* is not given safely in substance, but 'tis more safe to use it in infusion, or by correcting it with Nitre only, for the amending its noxious Nature: For because it is nothing but the meer Marchasite of Lead, having in it an Arsenical Mercury, and an external auripigmental Sulphur, certainly it is not void of all poisonous quality.

XLIII. Dioscorides says that *Vitriol* causes vomiting, which is to be understood of the crude, for being badly prepared (Chymists call it *Gilla*) it causes a mortal vomiting and death. One to empty his Stomach that was overcharged with salt Herrings, took a *Gilla* prepared by himself, and died on the same day vomiting: His Stomach was found perforated in three places, excepting only the thin outmost coat to which the *Gilla* stuck fast and had eaten into it.

Hein. ab
Heers de
Acid. p. 28.

XLIV. Salt of *Vitriol* is prescribed to be made divers ways, viz. of an elixivate Colcothar, of a blue calcin'd and elixivate *Vitriol*, according to Ang. Sala; and of white *Vitriol* purified by often solutions and coagulations, which Medicine is commonly called *Gilla Theophrasti*, and is altogether safe and easie to make: Yet the two first Medicines are notably styptick, and, inasmuch as they have endured the fire, are somewhat corrosive: but the last being kindly enough does gently pull the Fibres of the Stomach, and causes them somewhat to contract themselves, so that for the casting off what is troublesome they are at length convuls'd and cause strainings to vomit, yet such as soon pass over, and the disturbance of the Stomach is allayed in a short time. Salt of *Vitriol* is the more esteemed, because it seldom gives any disturbance beyond the Stomach, nor like Antimonials brings on Convulsions of the viscera and disorders of the Blood or fainting away: yet it is blamed, for that it works but dully, and sometimes not at all; so that after the taking of *Vitriol* and drinking a great deal of Posset-drink 'tis often necessary to provoke vomiting by putting a feather down the Throat, or by drinking *Carduus Posset* or oxymel of Squills.

Willis
Pharm. rat.
p. 60.

Idem ibid.

XLV. *Afarum* is better in infusion than substance, for thereby it becomes milder: in Decoction its volatile virtue is more driven away, whence it almost ceases to be a vomitive, unless it be boiled but gently. I have observed the root to be milder than the leaves. A strong man died of a superpurgation that had taken a spoonful of the Powder of the leaves, Antidotes being given in vain.

Gr. W. Wedel. de G. m. fac. p. 161.

XLVI. Divers descriptions of *Rulandus's aqua benedicta* go about, some affirming it to be made of *crocus*, but that of the Author himself is the best (Cent. 5. obs. 95.) Take of *crocus metallorum* from the bigness of a Lentil to the quantity of a Pease, of Water, Wine, Beer, Mead or other Liquor proper for the Disease, as much as suffices: Steep it for a Night, or in case of urgent necessity boil it: strain it, and the Dose is from half an Ounce to two Ounces.

XLVII. But note that that *crocus metallorum* (which I would have to be understood also of all other Antimonial Emeticks, for so even the gla'ss may be given, and that made by it self without Borax) is not here to be made use of that is made with the addition of Tartar, but that which is made of an equal quantity of Antimony and Nitre alone; whether the whole be detonated all at once, by putting

a live-coal into the Mortar, or successively, which latter falls in with the gla'ss of Antimony: but the other is more dull, and is not so useful for these purposes, but more for Eye-salves.

Idem.

XLVIII. Antimonials are corrected and rendered more mild, 1. By *Infusion*, for they are of an inexhaustible virtue, and that both in watry things, which extract but weakly, and also with tartish things, as Wine, which is better, whence is *Rulandus's aqua benedicta*. 2. By *Precipitation* with Salts, such as is *Mercurius vita*, commonly so called, though it have not the least smack of Mercury, a Vomitory good enough, and is nothing else but the Flowers, or precipitate rather of Antimony, loosed and devoured by Salts, and then freed and sweetened by simple water. See that you do not exceed in the Dose, for it is not to be given to above three Grains unless there be great necessity. 3. By *impregnation* with Tartar, which correction is the best and safest of all; namely when *crocus metallorum* rightly prepared without salt of Antimony, like the gla'ss of Antimony are boiled with crystals of Tartar and filtrated, and the crystals arising thence are given to one, two or three Grains. And this at this day is the best and most usual Vomitory among the choicer Practitioners and Chymists, which never fails if it be rightly prepared, wherein there is no small cunning: for thus its violence is kill'd as it were, and its virtue being unclosed and conjoined with the Tartar is obtain'd in a *Compendium* as it were, whence we have often given the same very safely even to Infants.

Idem.

XLIX. The *glass of Antimony* is prepared divers ways, and so of a different colour: but that is deservedly preferred, which is prepared of Antimony alone, without the addition of any other thing, by calcination, and then fusion: It is both a very good Vomitory, and also a Purger by Stool, evacuating very well all offending Humours. Being ground it is infused for a Night in a convenient Liquor, as French Wine, Rhenish, Canary, &c. Beer, distilled Water, Hydromel, Vinegar, vinegar and Sugar, &c.

Franc. de le
Boe Sylv. m.
m. l. 2. c. 10.

XLIX. Of the gla'ss of Antimony is made a vomiting *sapa*, whereof I have very often experienc'd a commendable effect: it is a very grateful Medicine, to be taken to the bigness of a Pepper-corn or an indifferant large Pease, in any Liquor that is acceptable to the Patient. As this *sapa* is prepared of the gla'ss of Antimony with Must (or new Wine that has not wrought) so with the thickned juice of fragrant Apples, Pears, Plums, Quinces or the like may there be prepared *Mixa*, Syrups, Rob, and Medicines of other names, very fit for bringing forth any Humours by Vomit, and withal safe and grateful. And this above all others does the gla'ss of Antimony perform, which many would more esteem of, if they rightly knew what vertues lie hid in it.

Idem ibid.

L. I have more than once prepared a tartish Syrup, or rather *Mixa*, of Quinces, viz. of their juice alone boiled to the consistence of a Syrup by a gentle fire; a laudable effect whereof, and often very different, I have oft admired. If you give half a spoonful hereof to Infants, or more to the adult, it incides glutinous Phlegm, and sometimes brings it up out of the Lungs by coughing, sometimes out of the Stomach and small Gut by vomiting, and sometimes expells it from the same Parts by Stool: And which is greatly to be esteemed of, it also adds strength to the Patients, and happily restores them; so that by this one remedy I have recovered many Patients that have loath'd most other Medicines. But it is chiefly profitable for evacuating and correcting Phlegm.

Idem ibid.

Uterines,

Uterines, or Remedies for the Womb.

(See of the Diseases of *uterus* or Womb in general, Book 18. and the suppression of the *Menstrua*, Book 11.)

The Contents.

They respect either the Vessels and passages. I.
Or the Blood; II.

Or the *genus nervosum* and substance of the Womb. III.
Or the extravasated Humours. IV.

In what kind of sweet things the Womb delights. V.

Whether acids are hurtful to it. VI.

Volatil Pellents are to be avoided in Women with Child. VII.

How we must use *Aperients* and *Astringents*. VIII.

How we must *astringe* in Women with Child. IX.

What sort of *Astringents* are convenient. X.

Purgers provoke the Terms. XI.

I. **H**ystericks respect either (1.) the vessels and passages which should lie open for the Blood to pass out by; and so hither belong *Aperients*, and such as remove obstructions or stoppages; as also *Incisers* and *Cleanfers*, both internal Saline and Sulphureous Medicines, and also external, as Baths, Clysters, Suffumigations, Pessaries, and other Abstergers.

II. Or (2.) the contents of the Vessels, or the Blood. The motion of the Blood to the Womb, is like that of the sea to the shoar, and it is Lunar, for Women that are in health have their Blood flow hither every month. To this littoral or shoar-like motion of the Blood to the Womb, have *Uterines* respect: And those are 1. *Promovents*, which procure a fermentation, turgescence and motion, either by rarefying and attenuating, which are particularly called *Emmenagogues*, such as are volatil oleous things, endued with a volatil Sulphur, as Savin, Saffron, Angelica, Myrrh, Camphor, &c. Saline things, the Salt of Mugwort, Borax, and especially volatil, as Scurvigrals, the Spirit of sal Armoniack, and other Acrimonious things: Bitter things, as especially Aloes; whence *Elixir proprietatis* is excellent for the Green-sickness: *Aromaticks*, which at once Remedy the glutinousness of the Humours, free the mouths of the Vessels from what obstructs them, and remove the phlegmatick, tartareous, and mucilaginous Humours that cleave about them, and dilate the pores, and in a word, make the passages free and open, and kindly solicit Nature to excretion. Where we must note by the way, That whatsoever things provoke the Terms, the same do also hasten the exit of the *fetus*, and expel a false conception or mole: yet stimulators are not the only things which do this, but comforting Balsamicks, as the oyl of Amber, Cinnabarines, Cinnamon, and divers preparations of these things. Yea hither belong also Purgers themselves, which often procure the flux of the Terms on the very day they are taken, for even they do both stimulate and drive forwards, and also add a new fermentation to the Blood: *Diaphoreticks* also, especially the Volatil. Or else by absorbing acid, sower, styptick Humours abounding, and too much fixing and concentrating the Blood, such as are fixt Medicines, but not all alike, for Crabs eyes, or chalk, shells, corals are not reckoned among provokers of the Terms, nor have they place in that case, but such as do more intimately sweeten and saturate the said Humours, such as are Steel-Remedies above all other. So that he who would happily cure the obstructions

of the Terms, may do it best of all with Steel-Medicines, such as *crocus Martis aperitivus*, *vitriolatus*, *saccharinus*, *Quercetan's* cachectick powder, or his Stomachal mixt with Martials, adding (for instance) the oyl of Cinnamon, which does very commendably serve this intention. 2. *Bridlers* and retarders, whether the Blood be too serous, and Acrimonious, or cholerick, unlocking and gnawing asunder the mouths of the vessels, or whether it issue plentifully through the breach of some vessel, or other hurts. Now this excessive fermentation and turgescence, is restrained both by watry coolers which temper and dilute the volatil, saline, and sulphureous parts abounding in the Blood; and also by earthy and styptick things which precipitate, separate, bind and hinder the motion of the same, as Plantane, Shepherds-purse, Corals, *Hematites*, and other things to be fetcht from astringents, likewise acid and sower things that do infringe and tame the said parts, as the Spirit of Vitriol, its tincture, the tincture of Violets, and Roses, the styptick antiphthick tincture of *Garmannus*, which does good in the immoderate flux of the Terms, and *Opiats* themselves. All these, I say, benefit in the immoderate flux of the Terms or *Lochia*, and also partly in the Whites.

III. Or (3.) the *genus nervosum* and substance it self of the Womb, as it is known that it is membranous, has a very great consent with the head, and is plentifully stored with Nerves: Medicines of this sort are the Nervine, enumerated under the Cephalick, things endued with a volatil Balsamick Sulphur, spirituous things, pleasant things, as Balm, Rosemary, Sage, &c. Castor, Amber, both which are full of an oleous volatil Salt, &c. and above all others, Cinnabarines; as it is certain by practical experience, that native Hungarian Cinnabar does greatly relieve hysterical distempers and convulsive motions of the Womb; likewise preparations of an humane secundine, Ivory without fire, and preparations of Harts-horn and the like, whereby it appears that that Medico-practical rule, That all Cephalicks are Uterines, or that all Cephalick Herbs in specie do also respect the Womb, and on the contrary, does hold chiefly in this sense, because of the society of substance, and agreeableness or analogie of the nervous parts. And these, especially the comforting *Aromaticks*, are Uterines, and profit particularly in the hysterical suffocation, and its various degrees, and consequently in fainting, swooning, &c. The same are approved in hard travail, inasmuch as they either strengthen Nature and the Nerves, as Cinnabarines; or do withal stimulate, as the oyl of Cinnamon, of Amber, &c. Also in the pain of the Womb, and *fluor albus*, or Whites, inasmuch as the compages of the Blood is too loose therein, and the serous ichor outweighing the oily parts of the Blood is cast off through the looseness and weakness of the fibres accompanying: whence such Uterines as are strengthening, and the oleous Balsamick (as Rosemary) profit in this case. From hence it is clear why Vinegar is called by *Hippocrates* *ὀξεγγυς* (or a Painer of the Womb) namely because it is offensive to the Nerves, because it fixes the Blood, and depresses and subjugates its sulphur and saline volatil parts: for otherwise when there is an intention to incise, or to tame the Sulphur, as in the *amor insanus*, or in the immoderate flux of the Terms, 'tis very proper, if it be not given in too large a dose.

IV. Or (4.) the extravasated Humours stagnating about the Womb, and *flatus* that arise from thence, putrid filth, &c. which case indeed often happens, and creates divers cruel Symptoms: of this sort of Medicines are 1. Balsamicks resisting putrefaction, Bitter, Gummos and resinous things, Aloes, Myrrh, *Scordium*, *asa fetida*, *Galbanum*, the essence of Amber, of Myrrh, of *asa fetida*, the Uterine Elixir of *Crollius*, &c. 2. Resolvers of the cloddiness of the extravasated Blood, whether already clodded or

or but a clodding, as Chervil, Crabs-Eyes *Bezoardicum Martiale*: Antimonial and other such like do notably dissipate whatever stagnates, and take away convulsive and hysterical Symptoms arising thence. 3. *Dissolvers*, *Diaphoreticks* and the more penetrating *Sudorifics*, as *tinctura Bezoardica*, the Spirit of Tartar, *mixture simplex*, which it self also purges out putrid filth, and Diureticks also themselves do notably cleanse the Womb. 4. *Carminatives* in a special manner, for *Carminatives* are the best *Uterines*, and as Practitioners have experimented, the same things that are good for the Colick do also help fits of the Mother, as the Carminative seeds, Zedoary, Galangal, *essentia carminativa* with the Uterine Elixir, the Tincture of Tartar, *Bezoardicum Martiale*, which are very excellent in the Hysterical and pains after travail. And these are good in Uterine *stasis*, which I have observed in a cacochymical Woman to be discharged out of the Womb like the *stasis* of the Belly; and also in hysterical suffocations produced thence, and from the putrid Blood stagnating there; likewise when the flux of the Terms and *Lochia* are painful, with anxieties, pains of the back, gripings, &c.

V. It is a rule amongst Practitioners, That the Womb is demulced by sweet things: But it is hardly to be understood of sweet things that are actually such absolutely, which indeed, where the fermentation of the Blood is to be renewed, have a notable use, inasmuch as they promote its turgescence; also in a fear of Abortion Honey is good outwardly, or Bread soaked in Honey and Sack: yet where the Blood is to be bridled, as in a too great flux of Blood and in other cases, they rather do hurt: So things sweetened with Sugar and Honey are naught for the hysterical, for they raise disturbances, and reprove and exasperate quieted symptoms.

VI. Acids (which follows as a Confectary from what has been said) and sweet things, are neither always to be abstained from, nor to be used promiscuously: This chiefly holds of Vinegar, for it is but little furnished with Sulphureous Particles; But such Acids as are Sulphureous withal, as the Cephalick Spirit of Salt, Nitre or Vitriol, are more friendly to the Womb; whence *Syrupus Byzantinus*, Oxymel simple, and that of Squills, and other acids hurt the Womb; but these being moderately Sulphureous may be used upon occasion. This appears from Diet; for if a Woman that has her Terms flowing eat Salads or other acid things, they are stopt thereby; namely because they are adverse to the tone of the Womb both as to the turgescence of the Blood, and also as to its own Nervous substance.

VII. In Women with Child Volatil Pellents are to be avoided: whence if the case be doubtful, whether a Woman be with Child, or only her Terms are suppressed, we hardly use to rise higher than Steel Remedies, which do not hurt, but do withal strengthen: Otherwise attemperaters and astringents are proper for them, as to the Uterine Vessels; and spirituous things, as to the vital strength of the *fetus*.

VIII. When we would open, strong Pellents alone are not proper; but moisteners withal are to be used: where we would bind, let not driers be omitted. Hence those Physicians err who in the stoppage of the Terms use only volatiloleous things, as the Oyl of Juniper, the Spirit of Sal Armoniack, the oyl of Savin, Borax and other things: for hence Whores do often use Savin and the like in vain, when they are not disposed to Miscarriage: namely we must withal have regard to the Serum, which is required as much as the Blood to turgescence. Whence I have always done more by moisteners, as *tinctura Martis tartarificata*, *tinctura Martis pomata*, uterine Infusions and Decoctions, than by other things.

IX. In those who are not with Child, we must not bind without revulsion; and in those who are,

not without regard to the *fetus*. As for example, If any labour under an immoderate flux of the Terms, which often springs from an obstruction of the Vessels, (which obstruction must be remedied) astringents are more profitable when you have first Bled; But if a Woman with Child have her Terms flow, the weakness of the *fetus* is always to be regarded.

X. In the use of astringents also the tone of the Womb is always to be respected, both as to the Blood, and also as to the looseness of the Fibres. Hence in the *fluor albus* or Whites, the common Astringents are not so profitable alone, as when Aromaticks are mixed therewith, as Rosemary, Chervil, Ivory, Castor, the magistery of Crabs Eyes, with the oyl of Anise, and of Amber, which is excellent, for otherwise there will be no good success.

G. W. We.
dél. de f. m.
fac. p. 117.

Vulneraries.

The Contents.

Internal Vulneraries are either of an Alkaline nature; I.
Or of a Balsamick. II.
They are not good always and in every case. III.
They are withal Resolvents, and dissolve clotted Blood. IV.
Externals act diversly. V.

I. **T**Raumaticks or Vulneraries are either internal or external; both are indicated by solution of unity in general, whether they be wounds, or bruises (especially with the hurt of the inner parts) or Ulcers, or Ruptures and opened Orifices of the Veins, falls from on high, spitting of Blood, Dysenteric, &c. in all which they are very good. But it being supposed that the Blood is the aliment of all the parts, 'tis necessary when there is solution of unity, that this also should be amiss; and therefore we must have regard to this, that it may the slier dispose the injured part to consolidation. Now they are chiefly of two kinds; either 1. of an Alkaline nature, which you may find largely discussed by Helmont: For he determines (not unfitly) that in every Ulcer there arises an acidity that is the token and companion of all putrefaction in the flesh, and that Alkali's do easily absorb it into themselves and consume it: so that all vulnerary potions contain in them an occult Alkali, and that volatil, if they be to resist the accidents that spring from the corruption of the acidity, inasmuch as every alkali kills every acidity it comes near. ¶ Let us apply hither that place of Galen 2. aph. 17. concerning the acidity of the Blood, where he says, The same thing that happens in Wines which grow sour, does also happen in the alteration of the Blood. Seeing therefore in wounds both the tone of the Blood is altered, and that it necessarily concurs to their cure; hence Vulneraries are such as absorb the acidity, and preserve the tone of the Blood, and likewise temper both acrimonious and ferous Humours, and moderately deterge. And such are the Alkalines in a special manner which have been already mentioned, as Crabs Eyes, which do both help in the foresaid wounds, and being boiled in Wine acquire a lixivious taste. So likewise *Antimonium diaphoreticum* is with very good advice taken within the Body in outward Ulcers; and thus the very Antiseptic of Peterius is good in a phthisis for this reason; and the Plants called traumatick, that is, which either have a nitrous detergent faculty, or something that is astringent and earthy, do respect the tone of the Blood

Blood and greatly resist putrefaction, and reduce preternatural ichors into order.

II. Or 2. they are of a *Balsamick* nature, and vigo-
rate the Blood by their volatil oleous Salt, that is
both strengthening and astringent. Thus *Fèvre*
(in a *Chymical tract*) relates, that a certain Surgeon
in all wounds did presently give some Nutmeg in
a draught, that the Blood might be vigorated by
its Balsamick vertue, and so all things might be the
fittler disposed for consolidation: And though these
Internals do not hasten in their substance to the
wound that is remote, yet they dispose the Blood
so as that parts divided may be the more apt to
close together again.

III. It is to be noted that vulnerary potions are
less convenient 1. in the beginning, whilst the flux
lasts, lest the Humours be further driven into the
part affected: 2. They are not so good in Wounds
of the Head, which do rather require driers out-
wardly, and Nervine absorbers inwardly; but
are better when the Limbs, or other *viscera* are
hurt; for through their same vertue they dissolve
the clodded Blood and strengthen its tone. 3. Re-
spect is also to be had to the Stomach, that it be
not hurt by them. Add 4. that the first region
ought not to be foul. In the year 1679. in Decem-
ber I had under cure an Inn-keepers Wife of Gene-
va at the sign of the three Kings: This woman
having an Ulcer in her Womb, by the Womens
advice (without my consent) took two vulnerary
potions, whereupon she fell into a Fever: But
she was cured by Injections of decoctions indued
with the same vertue.

IV. 'Tis observable that these Traumaticks are
most of them withal Resolvers or Dissolvers of
clodded Blood of both kinds, as Crabs-Eyes, Sar-
cocol, Myrrhe, Yarrow, &c.

V. These same things, of both kinds, being ap-
plied outwardly and immediately, are notably be-
neficial. Thus also Balsamick Sulphurs, native
Cinnabar, the fixt Sulphur of Antimony, &c. Of
the same stamp are also external Traumaticks,
Sarcoticks, which are either 1. moderately drying, of
an earthy and Saline, or Alkaline nature, as Ce-

russ, Pompholyx, Litharge, which do both astringe
gently and also strengthen, and remove impedi-
ments, and waste and absorb superfluous moisture,
and strengthen the lips of the Ulcer and Flesh;
so that it is made like to that which is sound,
and is not proud. Thus such like absorbing pow-
ders do often consolidate Ulcers that are stubborn
and hard to close through over much moisture
and looseness of the Lips of the Ulcer, which I
have sometimes observed. Whence it may serve
as a Rule, *Whensoever ulcers abound with superfluous moi-
sture, these moderate driers, and especially strengtheners, are
good, far before oily and emplastick things.* Thus dry
lint alone is useful in the wounds of the nails and
other fleshless parts. Likewise the powder of
Crabs-Eyes being sprinkled on fresh wounds heals
them, for it presently seasons as it were the flesh
and injur'd parts, so that they remit nothing of
their Balsamick vigour, nor conceive *pus*. An in-
curable ulcer has been healed up by pompholyx
alone; a corroding one drilling with a continual
moisture, only by the powder of Ceruss: Thus
also in wounds of the Head moderate and temperate
driers do the business; and on the contrary all
fat oily, unguentous things, and fat Plasters are
not at all good; unless one should perhaps except
such as are nervine, as the Balsam of Peru. 2. Bal-
samicks, whether they be *Gumms* and *rosinous simples*, as
St. Johns wort, Aloes, Gummi Elemi, (which is
excellent for stabs) Mastich, Frankincense, &c. or
oils, both made by *expression*, as the green oyl of El-
der, which being taken inwardly is a notable vo-
mitory, and outwardly is a Vulnerary; and by
boiling, as that of St. Johns wort; and by *distillation*,
viz. simple, as the stinking oyl of Tartar, which
consolidates very powerfully, and may easily be
boiled into a Plaster with wax; the oyl of Tur-
pentine: Likewise *Balsams*, both the native, as the
Indian of *Tolu*, and also artificial, as Plasters: But
all Plasters almost agree in this, that they defend
wounds from the Air, and cherish the part by their
moderately drying Balsamick vertue, as in parti-
cular Lead-Plasters are on that account very fa-
mous.

A

GUIDE

TO THE

Practical Physician.

BOOK XX.

Of the Office of a Physician.

The Contents.

He must study to get himself a Name by Lawful Ways. I.
 Let him not commend himself, nor magnify a small matter. II.
 Let him not refuse Consultations. III.
 Let him avoid Contention in them. IV.
 They must be held far from the Patient, and from those about him. V.
 He must get an exact Confession from his Patient. VI.
 Let him not give them over, who are past hope. VII.
 Let him be cautious in presaging Recovery or Death. VIII.
 We must have regard to a Mans former way of living, and to his Idiosyncrasy. IX.
 Let him remove his Patients out of one Air into another. X.
 Let him not tell, what his Medicins are. XI.
 In the Cure of Rusticks we must not insist too much on Method. XII.

Let him not for fear of blame forbear the giving of generous Medicins, and in the mean time let him observe the Patients Errors diligently. XIII.
 Let him not change his Medicins, without a necessity. XIV.
 When he can cure with Simples, let him abstain from Compounds. XV.
 He must not give Physick without a necessity. XVI.
 He must sometimes rest a while. XVII.
 He must prevent a Crisis by help of Medicins. XVIII.
 Sometimes he must do the Office of a Surgeon. XIX.
 Sometimes of an Apothecary. XX.
 Let him not prescribe two Medicins at once. XXI.
 Let him not despise ordinary things. XXII.
 Nor Chymical Medicins. XXIII.
 Let him not heap up a great medly of Medicins. XXIV.
 He must not repose much confidence in Medicins of occult qualities. XXV.
 Neither obsolete, nor dubious, nor new things must be prescribed. XXVI.
 He must not mix Contraries. XXVII.
 He must endeavour to discover those that counter-

B B B B B B

fin

feel a Disease. XXVIII.
 And them that put one Disease for another. XXIX.
 What he must do to them that lie torpid in Bed?
 XXX.
 What he must do, when first called to a Patient?
 XXXI.
 Let him not visit the Sick unsent for. XXXII.
 His Visits must not be too frequent nor too rare.
 XXXIII.
 Let him comfort them that bear the Disease impatiently. XXXIV.
 Let him inform his Patient, that he may have him obedient. XXXV.
 Concerning what, Patients must be interrogated.
 XXXVI.
 He must make it his business to know every Mans particular Nature. XXXVII.
 He must examine and ask many Questions, that he may come to the knowledge of the Disease. XXXVIII.
 He must have a care that similitudes do not deceive him. XXXIX.
 Whether he ought to tell the event of the Disease to the Patient, when he desires to know it?
 XL.
 He must not always severely deny, what the Patient earnestly desires. XLI.
 Whether we may cure one Disease with another?
 XLII.
 He may get himself credit by procuring sleep to his Patients. XLIII.
 He must not be rash in giving his Judgment what the Issue will be. XLIV.
 Let him not barangue upon Diseases before the Vulgar. XLV.
 One Sower and another Reaps. XLVI.
 Let him know the cure of Diseases by Transplantation. XLVII.
 Travelling, to know Medicines, is necessary. XLVIII.
 He must not undertake the Cure of many Patients at once. XLIX.
 Let him confess his Errors. L.
 Sometimes he must be an imitator of Empiricks. LI.
 Sometimes he must depart from the general Method. LII.
 He must be skilled in the Oeconomy about a sick Person. LIII.
 Where he must take his leave of the Patient?
 LIV.
 How he must regard the Stars? LV.
 He must have a care of the Climatrical years. LVI.
 He must not trust to Universal Medicines. LVII.
 If the use of Remedies be necessary, and the Patient or By-standers be against it, let him foretell the danger of omission. LVIII.
 Oft times the cure of Diseases must be committed to Nature. LIX.
 In obscure Diseases he must take especial notice of what does good, and what does harm. LX.
 Sometimes an Empirical Physician is to be preferred before a Theoretical one. LXI.
 When Experience, and when Reason is more necessary. LXII.
 How he ought to reckon the critical days? LXIII.

I. **S**ome Physicians have indeed got themselves Authority and Esteem from a popular Opinion, but from no Merit of their own. Plato makes such to be far different from Ingenuous, Liberal, and Noble Physicians, of the true race of *Asclepius*. Hippocrates, *l. de Præcept.* shews the cause of their Reputation, which, he says, must be ascribed to some wealthy and powerful, but stupid and ignorant Men, who having been cured by them of some Disease at hap-hazard, do cry them up: or to some Covetous rich Men, who in stead of giving Fee, use to extol unlearned Physicians with false Commendations. Or they have got a Name, because they have cured Diseases, that were either difficult indeed, but acute and salubrious, which though they be conquered by the goodness of Nature, yet the Cure is ascribed to some slight Medicine or other; or they are Chronical, and in the declension. And happy is the Physician, that is called in the declension of the Disease: for he wins the day without striking a stroke, and reaps the advantage of another Man's Victory.

Zwingerus.

II. Let him not imitate villanous Physicians, who by Deceit and Cheat endeavour to get themselves a Name, which they cannot get by their Desert. While he praises his own Pains, Diligence, and Success, and ceases not to reprehend and accuse others Cures as bad and unsuccessful. Or he undertakes not any Disease but only *ὀρεσζωδία* or a Noisy one. For what meaneth Hippocrates his *ἀδύνατος ὀρεσζωδός*? *ὀρεσζω* signifies to prate or make a Noise: Therefore the Disease is *ὀρεσζωδία* or Noisy both in respect of the Patient and of the Physician; Every Disease of a Great or Wealthy Man is *ὀρεσζωδία*, because though never so slight, yet the Disease seems dangerous because of the Honour and Power of the Patient; especially, when, as he said before, villanous Physicians are extolled for some easie Cures, but which they have dissembled both by word and deed to have been very difficult, so that by the craft of the Physician every Disease shall make a great Noise, which he hath in words set out to be dangerous. Therefore Celsus, *lib. 11. c. 9.* says, that it is Jack Pudding's part to extol a small thing, that he may be thought to have done something great. And by such report they intrench themselves, as in a Fort, that if any thing unexpected should happen, it may not be ascribed to their want of Skill, but to the violence of the Disease.

Idem.

III. There is no part of a Physician's Office more illustrious than Consultation, because by it alone unlearned Physicians are known from the Learned, who practise Physick like as the Learned, and impose on the rude multitude: And there is nothing that brings greater advantage to the Sick.

Claudius.

IV. Discord among the Consulters is to be condemned, because the stiffness of private hatred prompts them to a common mischief, and oftentimes ruins their Patients health. We must indeed sometimes oppose other Mens Opini-

Opinions, if they appear not to be salutary; but it must be according to the Laws of Reason and Experience: and we must with candor always acquiesce in their Advice, who excel in Judgment, Experience, Reason, and Plurality.

Ranchinus.

V. Physicians must hold their Consultations apart from their Patients, to the end every Man may more freely speak his fears or his hopes; For fear is not easily removed out of a Patients Head, when he is once possessed with it: And apart from the People, admitting one Auditor, or at most but two, who may take care of the Sick; For the Vulgar, or he that is ignorant of the Art, ever has something to add, or to abate, or to condemn in the Counsels of Physicians, and he finds fault with all things, if as much heed is not given to his impertinencies, as to the wisest Physician; and so much the more, if the Remedies resolved on do not cure the Disease. Besides, if any one of the Physicians have a spark of vain-glory in him, he will be exalted and sawcy, when he has a Crowd about him, altering those things which another has propounded before, and extolling what he shall propound, yielding not the least to Reason, but loses the time in prolix trifles. In the mean time the poor Patient suffers, who is in no fault.

Notallus.

VI. A faithful and true account of the Diseases, their Causes and Symptoms wherewith they are troubled, must especially be required of the Patients. For many (as *Celsus* says) die through their own fault, especially Women, while their Modesty will not allow them to reveal the secret Diseases of their Bodies.

Ranchinus.

VII. The strength of Nature, which rules in our Bodies is admirable, not altogether conspicuous to Human Ingeny, for oftentimes, when to us she seems oppressed by the Disease, and knocked down dead, so that she is unable to defend her self any further, what succour soever you bring her; yet she often, by some occult faculty, takes heart again, rallies against the Triumphant Enemy, and in a fresh Combat often comes off Conqueror. Now since it is so, and since oftentimes such unexpected Events have convinced us, that as long as there is Life, there may be hopes, we ought not to despair. Besides, *Hippocrates* himself acknowledges that predictions of Life and Death are not always so certain: therefore we must not utterly deny a Patient all Remedy, how desperate soever his case is. ¶ To deny the taking those in hand, in whom there is no hope of recovery, is not in all cases to wave the name of a bad Physician, yea sometimes it gets a Man the disgrace of impiety, especially if Parents, or Kindred desire it. For it is a Pious thing, (not omitting the Prognostick) though death, or some incurable Disease be upon a Man, while the Patient has his Understanding entire, to comfort him, put him in hopes, and, as much as may be, to assuage his Disease by Remedies.

Dietericus.

Notallus.

VIII. Let a Physician be doubtful in his Prognostick, unless there be most certain and

infallible signs of death: Let him be moderate in his promises: Yet let him always give hopes rather of Health, than foretel certain Death: For when the Patient is given over by the Physician, if he do recover afterwards (as he often does) either by chance or Nature, the Physician incurs Infamy. But if he give hopes of Health, and Death does follow, the Disgrace is not so great; because many things might happen, Errors, Excesses, and some new Diseases, and the change from Health to Death is easier than from Death to Health, which by the course of Nature is impossible.

A Castro.

IX. In some Diseases great regard must be had to Mens way of living, otherwise they will hardly be cured, and so many good and admirable Cures have been performed. A certain Cleanser of Jakes, when he had been used to good Scents a while, fell sick, and when no Man could cure him, he recovered by smelling to his old Scents. I knew a Physician, that cured a Country Fellow, whom the Physicians had given over, by prescribing him a Country way of living, as Pulse, Ryebread, &c. And I have observed, that the Region where we live makes strong Impressions on us, which ought to be regarded; for as we are at Sea inclined to Vomit, which ceases as soon as we get on Land again: so I knew one that lived on the Sea, who was as much troubled with Vomiting on Horseback, as we are at Sea. ¶ I knew a stout Soldier,

Borellus.

X. It is *Celsus* his Judgment, *L. 1. c. 3.* that it is not very safe to go out of a wholesome Air into an unwholesome, nor out of an unwholesome into a wholesome Air. And this is in a state of Health. For in Diseases he tells you in another place, *L. 2. c. 1.* that that Air is worst for a sick Man which made him sick. In a Pestilence, which rages through the Infection of the Place and the People, Change of Air is good. *Galen* sent Consumptive Persons to *Tabie*; *Pliny* sent them to the Woods. It has done several among us good in Quartane Agues. Only we must have a care the Alteration be not sudden. Therefore in *Italy* they take a very good course in their Hospitals, they turn those that are upon recovery into a spacious Room, especially at *Naples*, that by degrees they may be used to the Air; before they go abroad. If the place cannot be changed, yet some alteration in the Air at least must be procured, which must be open, tempered and corrected with fragrant and Alexipharmack Scents and Fumes, lest the enclosed Malignity, and Infection of the Sick might prove injurious to the Patient, and to them that are by. We must take great care in every Disease,

B b b b b 2 that

that we be not too superstitious in shutting the Windows, and so infect and kill those Patients, who otherwise might have been saved.

f. Barthol.

XI. Let neither the Physician nor the Apothecary declare what their Medicins are, either to the Patient or to them that are by; but let them only signifie that they intend to give a Purge, a Vomit, or a Clyster, and conceal what these are made of: Both because otherwise they may be improperly taken without the advice of a Physician; and because, when things are known, they are contemned, either for that they are ordinary and common things; or for that some Fool in the Profession has condemned them; or for that they are cheap. So *Galen* reports of a certain Rich Man, who slighted good Medicins, because they were sold cheap.

Botallus.

XII. According to the Vulgar Proverb, A desperate Disease must have a desperate Cure: So likewise to unskilful and Rustick Persons, who despise all Method, and hate a multitude of Medicins, such Medicins must be given as remove the cause of the Disease, or the greatest part of it, as much as may be. Otherwise, unless all succeed according to their desire, they run to Quacks and Wizards, and give far more heed to their Saws, than to the best Advice any Physician can give them.

Gabelchor.

XIII. *Hippocrates* bids us observe all the Patients Errors, whether about Meat and Drink, or about Medicins, or External things: For if through their own faults they grow worse, the blame is laid on the Physician; if it happen when any thing has been done towards a Cure, and especially if he have given any ingrateful Potions, or a Purge. For these things are usually lookt on as things of great efficacy. And if after the taking the said things any ill happen, the taking is blamed, though the fault truly lies in the Patient: And in our days this is frequent. Now many Physicians, to avoid this reproach, more valuing their own Reputation than their Patients good, give some insignificant Medicin, or prescribe that which is not worth speaking of: for if they Bleed, they exceed not three or four ounces; if they give a Purge, they exceed not *Manna*, Syrup of Roses, or such things, and they give generally too small a Dose. By which method indeed these Physicians have a care of their own selves, and often endanger their Patients Lives. Neither *Hippocrates* nor Christian Religion puts any Man on this. But they both tell us, that when generous Medicins are given, the Errors of the Sick should carefully be observed.

Martianus.

XIV. Frequent changing of Medicins argues either ignorance or diffidence in the Physician. This may be understood in a twofold sense, either as to Method, or as to Medicins. The first argues precipitance, and that the Physician is out of the way, because he knows not which the way is. But that of the Comedian suits not with the Physician, *Quid si sic tentem, si hac non succedit, alia tendenda est via*, What if I go so to work, if this

way succeed not, I must go try another. Nor are we always tied up to the self same things: for so the Physician may prescribe much, and the Patient take little. But the changing of Medicins, to one and the same end, is both lawful, and argues a Man abounds both in things and words. For as it is a reproach to a Physician always to give the same thing, as if he knew nothing further, and had spent his whole stock, though mean enough, whereupon the Patients run to Empiricks; so every hour to change a Mans mind and his Medicins is equally a disgrace: for he that is every where is no where.

XV. We must always endeavour in the composition of Medicins to avoid a nauseous Treacle-Mixture of divers Simples, which is not necessary; It is useles, uncertain, dangerous and chargeable. Nature, who is content with a little, delights in Simples, and a Disease will sooner be cured by one proper simple Herb than by these prodigious Compositions. *GOD*, says *Helmont*, in *Pharm. ac Dispens. mod. sect. 5.* out of the Providence of his Eternal Goodness and Wisdom has abundantly provided for future necessities: HE made and endowed Simples to answer all Occasions: And by how many more the Compounds in a Medicin are, so less certain will the Compounder find the effect of them to be. Therefore *Zwelferus*, in *appendice ad Animadv.* advises well, To be content with simplicity in the matter of Medicin; and to forbear a needless trouble in amassing so many divers things together; But to practise with one simple, for what *GOD* has appointed it, or but with a few, as poor Country People do, to whom the Chief Physician out of his meer Mercy has revealed most wholesom Medicins, with which they do great things in great Diseases, and sometimes to the shame of Physicians. Hence it was, that the most Learned Physicians of old, *Hippocrates*, *Galen*, and others seldom used the more operose Compositions; but by only one Simple, or by two or three joined together they did wonders.

XVI. We must not use Medicins, but upon urgent necessity; So *Hippocrates*, *l. de vict. Acut.* will not give so much as a Suppository, unless the Body be very Costive: For Medical Helps do but create a trouble to Nature, when there is not a necessity for them.

XVII. In curing of Diseases, and in preservation of Health we must not be always using Remedies, but sometimes rest a while, that is, do nothing but order a good Diet. Thus we must do in the *Crisis*, and after a perfect one, and in the state of the Disease. *Aph. 8. & 20. Sect. 1.* Physicians, says *Livy*, sometimes do more good by doing nothing, than by moving and acting.

Dietericus.

XVIII. Whether a Physician can promote Coction of Humours, and so prevent a *Crisis*, or the stated solution of the Disease, is a Question. In this place it is not my Intention to reject a *Crisis*, and to deny all manner of endeavour to Nature in Diseases, as a *Crisis* is merely the genuine work of Nature, or, as

Vallesius,

Vallesius, 6. *Epid.* 5. expresses it, An extinction of the Disease at once with perturbation and evacuation. But I intend only to reprimand some Practitioners, who to the great damage of the Sick, with a filthy loss of time, do as unhappily as frivolously connive by their delays and their sugared Medicins, feeding the Disease, so that it increaseth. Whereas when Diseases are beginning, if any thing be to be done, we must do it. And so it lies upon the Physician to cure Diseases before a *Crisis*, and without one. Nature makes not a *Crisis*, except when she bears the whole Burthen, on set days. Therefore a true Physician, says *Helmont*, l. de Febr. c. 2. sect. 18. must conquer the Disease before a *Crisis*: If he do otherwise, nothing at all can be ascribed to Medicin. For if a *Crisis*, as the Excellent *Langius* in *Miscellan. Quæst.* 4. argues, must be expected in the cure of Diseases, Physick indeed will be needless, because thus the whole business of the Cure is committed to Nature only, and not to Art or to an Art's Master. Nor does it hinder that there are in our Countries many Solutions of Diseases, and very few *Crises*; for even these solutions of Diseases are made by precipitation and total expurgation of the Morbifick Matter, as of an Exotick Ferment, out of the Mass of Blood, whether this be done manifestly or obscurely. Therefore if the Physician hasten this Cure immediately at the beginning, and leave not the whole business to lie on Nature's shoulders, he will quickly put an end to the Disease. So it is far better to nip a Disease in the bud, than to tarry for a full Harvest: For Example, In burning, Malignant Fevers, what do you think must a Physician do in the beginning or increase? Must he commit the business to Nature, only cooling the Stomach a little with Emulsions and Juleps? Or must he not rather oppose the Disease with a skilful dexterity and contend against it by Specificks, Febrifuges, and Alexipharmacks, (which precipitate the febrile and poysonous Matter) Diaphoreticks, and Diureticks? And when he does this, does he not conquer the Disease before the *Crisis*? For as long as the Fermentation of the Mass of Blood lasts, there is Crudity, and when the Fermentation is gone, Costion comes.

Hofman.

XIX. It is not unbecoming a Physician, who is skilled in the Manual Operation, to breathe a Vein, when there is no Surgeon to do it, or if in his presence the Surgeon mistake; Or if he set a Limb that is broken or out of Joint. For a Surgeons work is one of the three parts of Medicin, from which *Galen* only abstained, when he saw it in the hands of Empiricks and the Vulgar.

Botallus.

XX. He that shews the way of using Medicins, and making them up aright, must be reckoned a knowing and excellent Artist. But he that makes up Medicins only for gain, is not a Physician but a Servant. Now he that makes Medicins not only for this end, but also for others, is not a Servant, nor an Apothecary, but a true Master Workman.

When a Mans Life lies at stake, we may not indeed commit the making up of Medicins to every body: for some Apothecaries are very ignorant, and make very dangerous Medicins: And many more die of them, than by the violence of Diseases, or negligence of Physicians.

Augenius.

XXI. Let him never prescribe two Medicins at once, and leave the Patient to his choice: Because then he is at a loss and can trust neither of them; but blames his Physician for Inconstancy.

A. Castro.

XXII. A Physician ought not always to condemn the Medicins of the common People: *Ἐὰν ἰσχυρὰν ἰσχυρῶν, ἢ ἢ δὴ καὶ ἑυμάρων*, *Hippocrates* gives in charge among other necessary things to Physicians. *Hoeserius* in his *Hercules*, p. m. 77. has rendred it elegantly; Let no Man, says he, be ashamed, if he be never so learned, to learn something, that conduces to the perfection and ornament of his Art, whether it come from an old Woman of fourscore, or from a learned Man, so it be not superstitious.

XXIII. Whereas the Writings of Physicians of old, as also of the Modern, who follow their Dictates, do testify that most of them were very little, if at all conversant in Chymistry, without which no Man can ever comprehend the nature and hidden virtues of Minerals. It is to be lamented, that with this gross Ignorance in many there should be joined so great Arrogance and Pride, yea, Madness, that some have not been ashamed to declare in Writing, that like Cattle they will go the way they are going in, not the way they should go; and that they had rather err with the Ancients, than be in the right with the Moderns, especially with the skilful in Chymistry, and by their guidance cure more successfully: A saying and Opinion certainly unbecoming a Man, more unbecoming a learned Man, and most unbecoming a Christian.

Sylvius de le Boe.

XXIV. Concerning the heaping up of many Simples in the Composition of Medicins, we must observe what *M. de Gradibus*, cap. 1. de *Cephalæa* tells us of *Avicenna's* mind, That of various and many Simples, that are none of them Purgative, a Composition may be made which is purgative; and on the contrary: A convincing Argument, how that oftentimes from an incongruous confusion of Simples and the fermentation of the Medicin, a new form results to such a Composition, quite contrary to the Physicians Intention, and which is worse, to the Patients Health.

XXV. I have spent about forty years in curing of the Sick; and I got little or no help or credit from this sort of occult properties in curing of Diseases. *Galen* also, l. de ren. pass. seems to be of the same Opinion, though at other times he is a great assertor of the said properties. He that will, says he, be a famous Physician, must seldom use Medicins, which help the Sick by an occult Quality. Truly he could not well shew more clearly, how little he trusted to them; and that he used them not, but when the case was desperate,

desperate, because of the violence of the Disease; or when other Medicins which work by manifest qualities, were not able to cure the Disease. I have often, upon *Galen's* Authority, seen Powder of Mans Skull given to Epilepticks: I have ordered Seed and Root of *Pæony* to be hung about the Neck, and yet not till I had first purged or evacuated, and had ordered a proper Diet. But all proved ineffectual, and did no good that we could observe. Sometimes also I had a mind to try, whether Wolf's Dung, tied to the Belly of one in the Colick, or drank, would do good, and a thousand other things, which *Galen* says do operate from a property of their whole Substance; but they did no good. Therefore a certain Physician in our time used facetiously to say in jest, that such properties were deservedly called Occult, Because, *says he*, it seldom happens, that any one finds any effect or benefit from them. Nor are they undeservedly ridiculous in the Eye of grave Physicians, who, while they believe these old Wives fables, do cheat the half dead Patients, and put them out of all hopes of recovery. And this Error, which ought much to be lamented, is not yet fully discovered. For Physicians do still rashly give Medicins of occult qualities, to the ruine of the Patients, out of a desire rather of vain ostentation, than of benefit to the Sick, Because, that they may be thought to know more than others, they do amiss in giving an unusual thing, and of an unknown faculty, to them that are dying.

Puteanus.

XXVI. Obsolete Medicins must not be prescribed. Indeed for many Ages the prime of Medicin was comprehended in Receipts in the Shops, which they only and always used, trusting more to their Masters than to themselves, whereby there was no Accession made to Physick. Therefore many things are deservedly grown obsolete. This *Augæa's* Stale must be cleansed. This holds good in most Simples, simple credulity and transcribing being exposed by Botanists to the publick. I dare say, not the hundredth *Encomium* has been confirmed by Experience. The case is the same in unusual things, both old and new. Therefore as we must not raise from the Grave, as it were, the opinions and secrets of Monks, and rely on them; so we must not boast of Singularities, such as the best Apothecaries Shops know not. Doubtful things are prescribed, as Opiates in a Pleurisy in the beginning, strong Purges or Vomits in Consumptions, *Trochisci de Auripigmento* for a Fume in these Diseases, *Electuarium de Arsenico* in *Asthma's*: So other things may fall under this denomination, Mercurials and Arsenicals, and the generous Cures that we read of by them, must either be understood with grains of allowance, or must not be easily imitated. Things also that have never been tried, must not easily, nor without great reason be experimented in a Patient. Medicins may be said to be doubtful on a twofold account, either of the preparation: (Wherefore in well ordered Shops they write

in what year, and how such and such Medicins were made;) or of their Effect.

Wedelius.

XXVII. A Physician must not mix those things which destroy one another by manifest contrariety. Two things in particular do give instances of this thing, in which notwithstanding an error may easily be committed: For Example, Vitriolated things must not be mixt with Nitrous ones, neither in a liquid nor in a solid form. For, as in the first case there arises *Aqua fortis*, so in the later the same smell arises: And this must especially be observed in Compounds, that we mix not Vitriol of Mars with *Nitrum Vitriolatum*: for it is the same thing as if they were in another form. So aluminous things must not be joined with Alkalies, a fault that may easily be committed in Fever Powders. We must therefore have a care that when Magistery of Alume is an Ingredient, we put not in Salt of Wormwood or any such thing.

Idem.

XXVIII. Some do counterfeit Diseases, whose deceit it belongs to a prudent Physician to detect. Slaves counterfeit Sickness, that they may not do what is enjoined them by their Masters; Prisoners, to avoid or defer the bitterness of a Prison or Torture; Soldiers and Seamen, to avoid the danger of some Expedition or Voyage; Pettish Women, to make their Husbands love them.

In the year 1588, when the great Armado was sitting out at *Lisbon* against *England*, a Whore, who had inveigled some Men of Note, who had Wives, to her Bed, and was to be banished for it, counterfeited a Miscarriage by scattering a mixture of Milk and Blood all over her Bed, and she desired a Testimony of the thing; but could obtain none from me.

Galen relates in a Book upon this subject, how one feigned himself in a Colick, whom he found out both by his way of living, which was not apt to breed a Colick, and by a cunning peculiar to himself.

Now the Diseases that are counterfeited, are usually Swooning, Apoplexy, Fits of the Mother. Thus some ty their Arms so strait, that the Pulse can scarce, if at all, be felt. When they are called on aloud, they do not answer: If they be prickt a little, or their Ears pulled, or their Fingers bent, they bear it patiently. The Cheat is discovered by asking, whether any want of Food has preceded, whether any loss of Blood, whether a Looseness, Vomiting, or immoderate Sweating, or any Disease, or whether he has been in a hot place, or one of an ill quality, as if there be Coals half kindled in a close Room; or if some pusillanimous Man be put into some great passion. And lest the Physician should be cheated by some false Servants, let him see that the Arms be not tied. But if the extrem parts be cold, and if a cold Sweat burst out, especially about the Head, Face, and Neck; if the Pulse be insensible and formicating; if the Breathing be little and cold; if the colour in the Face be gone; if he void his Excrements; these things signify that the Diseases are not feigned.

cd.

ed. But if there be no such signs, that the Physician may find out the Cheat more certainly while the Cheater lies as if he were asleep with his Eyes shut, so that he looks as if he were in a Swoon, he must mention and make ready some strong Medicines, he must order Burning, bending of the Fingers, and pricking of the Body with Needles: For by these means you will find whether a Man is really sick or counterfeits.

Some know how to raise Swellings, Blisters, and Ulcers, as by washing the Skin with juice of Spurge, or with a decoction of Spanish Flies or Wasps in Water: Or by applying scorching Fennel, or Turbith, or Poudre of Yew, which is usual with Beggars. The deceit is discovered; because Blisters and Swellings, caused by Application, are easily cured only by applying cooling things, as juice of Poplar or *Unguentum Populeon*, to the sore. It happens otherwise, if Swellings arise of themselves, because they do grow worse by Coolers. Cunning Women also use to pretend they are with Child; But it is known to be counterfeited, because the Belly is lax and unequal. Some counterfeit Madneſs, whom you may know by their Habit, and want of signs of Madneſs or Melancholy. By which way the *Greeks* by throwing *Telemachus* the Son before the Plow, when *Ulyſſes* the Father had passed him by and lifted the Plow over him, they knew thereby he was not Mad. Some with the Steam of Brimstone or with some such thing discolour their Face. Saffron or Rheubarb tinges the Urine; they wash with this, and so counterfeit a Jaundice: But when the Face is washed, and more of their Water is looked on, the deceit is discovered.

But whoever do counterfeit Pain, may easily be caught at their fiction, because they bear it better. For they that are in misery indeed, being disturbed by the violence of the Pain, do put themselves first in one posture, then in another, which they that counterfeit do not observe. Besides, they that are very ill of a Disease are willing to admit of any Remedy, voluntarily send for Physicians, and do whatever they prescribe. But if they be but a little or not at all sick, they refuse such Remedies. Therefore the Physician would do well to add this, that such things do no good but only to such as are very ill. Sometimes also it happens, that a wounded Man, either out of hatred of him that wounded him, or to get some Money out of him, feigns that some Limb is hurt. You must touch the Hand or that Limb unawares; or apply a Plaster with promise of certain hopes of a Cure. Thus many use to impose on ordinary Physicians, to their discredit. Some that have been condemned to the Gallies, have counterfeited hurts in their Arms, and some unwary Surgeons have confirmed the same, for which they have been sued afterwards; because the contrary plainly appeared.

In the year 1664, I was called to *Coudetum* a Village of *Vallis Transversæ* about seven hours

distance from *Newenburgh* in *Switzerland*; it was to a Woman, who was struck on the Arm with a Staff, or rather a small Rod by a Neighbour of hers an Honest Man, who had been often provoked by her ill Tongue. She took the injury so heinously, that, because she could not be revenged, she took her Bed, designing to starve her self to death, to the end that he being guilty of her Murther, might suffer death for it. She had been three days without Meat, and could put her self into Fits when she pleased. He doubting her safety called me. I found the old Woman in her Bed, lying in an Hysterick Fit, pale because of her fasting, but of a constant and orderly Pulse. There was no mark of any blow upon the Arm that was struck, nor any swelling. I held Matches of Brimstone to her Nose, the steam whereof she bore patiently: then I suffered the end of her Nostrils to be singed with the Flame. She being desirous to know who it was that used her so, opened her Eye-lids a little, and shewed the Whites of her Eyes, and shut them again immediately. I bid the Surgeon with a loud Voice to heat the Fire-fork red hot, and apply it so to the Soles of her Feet. She being scared with the Fire awoke with a little yawning and stretching, and then she asked me, why I would be so injurious to an innocent person? I told her I used things to bring to life again, such as were so dead. It made good sport, and joyed the Aggressor not a little, who having received a Testimony of me of the wickedness of the Woman, dismissed me, and waited on me to the City.

XXIX. Many take wrong Advice of Physicians, counterfeiting the Headach, Burning in the Night, or some such thing, when there is no such thing, but Ulcers in their Privities, which they are foolishly afraid to confess, desiring only to get a Purge or Bleeding from the Physician, hoping by that Remedy alone to obtain health, without taking care of the part affected. But within one Month or two most of them find, they have not so much deceived their Physicians, as cheated themselves. Some burn with Lust; Others with Anger; Secret Fear grieves some; A silent Care others: All which things are the fountains and causes of Diseases, unknown to a Physician unless they be told him; which if the Patient may not discover, it is not fitting in the least to dissemble his grief of Mind in general: For the Physician perhaps will abstain from many things, and prefer others, when he finds an afflicted mind, which he would not do, were he to contend only with what of the Disease he finds apparent. I had a Patient under cure once, who complained of a violent pain in his Breast, and a Fever; yet no Fever appeared; the discovery of the Pain depended on the Relation of the Patient: He complained constantly, sighed, and had no sleep: He continued four days in this anxiety: About two of the Clock in the Afternoon of the fourth day, a Crisis of his secret Disease did unexpectedly break out in my presence; which cured the Man: For a

Servant

Botallus.

Servant of the Patients came in from *Lions*, who told him he had got the Cause in a Suit at Law, which the Patient expected with Impatience. Behold, says he, the cure of my Disease, now I find my self well: for this doubtful Expectation tossed my mind every way. And so he had no need of a Physician afterwards.

XXX. *Hippocrates*, 6. *Epid.* 7. bids, *When there is need, raise the Timorous from their Beds, and by change excite the Torpid to such things as they act slowly.* Which Rule though it seem but slight, is sometimes of great moment; that the Faculties may not grow torpid, and the Patients be much weakened: for some Diseases are of a hard *Crisis*, the solution whereof if you should expect before the Patient did rise, he would grow faint, the Faculties would forget their office, and he would die. And thus we must often force the sick to rise from their Bed, though not perfectly cured, and excite the Torpid to such things as they act slowly; that is, we must put them on doing things, though they be slow and dull, and do them but slowly and lazily: For by degrees they will lay aside their idleness, their faculties will revive, and so by degrees they will conquer their Diseases, which Diseases would never have been conquered by them, while they lay in Bed, only thinking of their own Misery. This Rule holds good in Chronical Diseases, and in Relapses after Acute ones.

Vallesius, com. in loc.

¶ I will give you an Example of the benefit of this Rule. *Anno 1670.* Mr. *Theodore Jacomote* of *Geneva*, seventy years old, was taken with a Disease, which confined him to his Bed for four Months: All the Functions both of his Body and Mind were brisk, if he could but have walked. His Wife being tired with the tediousness of it, sent him in a Waggon into the Country. Within three days strength returned to his Feet, and now, considering his years, he lives well in health. The jogging of the Waggon shook off the Numbness from his Feet, and kindled the innate heat that was buried, the change of Air and place concurring with it.

XXXI. When a Physician is first called to a Patient, after he has put the Patient in hopes of a Recovery, let him order something besides Diet presently, that he may not be thought to practise Physick by Books: Especially when he is called after other Physicians: For then all do expect something more than others have done before you. Therefore when you are informed what they have done before, betake your self to some other sort of Remedy, yet such as you think is more effectual; lest, if you should repeat the same things, they should think you were called to no purpose. If the Disease be acute, you must think of Bleeding, Purging, Cupping, &c. If Chronical, of Bathing, Sweating, use of Steel; or of Stupefiers, if Pains or Fluxions, or much want of Sleep do trouble a Man. But if the Disease be of such a sort, as may be cured by Diet alone, when it is ordered, you must prescribe some Physick, which may do no hurt; and which in

stead of Diet may be able to do much good; lest they should call you ignorant, and maintain that Nature cured the Disease; because you knew not how to do it. And this must be done especially, when the Patient is one of them, who is always tampering in Physick. For some are so solicitous about their Health, that unless they take Physick often, they think they shall die. And the Vulgar do not attribute the Cure by Diet to the Physician, but to Nature or to the Cook, whereas the Prudence of a Physician is in nothing more illustrious. Nor yet do they please me, who for lucre's sake, are always prescribing something: For this ought to be a Rule, if the Sick can be cured as well without Medicines as with them, that we always abstain from them, especially from such as may move or alter; both to save Charges, and that Nature may not be weakened: and finally, because many things, when moved do harm, which unmoved would do none.

A Castro.

XXXII. A Physician should not come near the Sick, unless he be sent for. This Rule must ever be observed: For if he visits a Patient unaskt, 1. He renders himself suspected either of Ambition or Covetousness: for Men attribute the Visit to one of these, not to good will. 2. You cannot be certain of the Confidence, which *Hippocrates*, 2. *Prognostic.* 3. says a Patient ought to have in his Physician. 3. The Patient is not obliged to Reward him, since his pleasure does not appear to the Physician, whether he was willing to have this service done him, by a Man, who has tacitly declared, that he is well satisfied, if the Patient will accept of his visit. 4. The Patient was either his Acquaintance or not. If he was your Acquaintance and sent not for you, he therefore did it, because your Pains was not acceptable. If no Acquaintance, your visit is improper, for if any thing happen but well, you will not want suspicion. 5. Your Visit perhaps will grieve the Patient, when he holds himself obliged to Fee you, though he did not call you: For some Patients are so covetous and fardid, that they neglect all the means of Physick for fear of their Money.

Idem.

XXXIII. Visits to Patients must not be too frequent nor too few. For too frequent visiting, where the Disease is but gentle, does argue either want of skill in a Physician, or Covetousness in extorting of Money. And too spare visiting in great Diseases does argue the same things and more than the frequency; namely either Covetousness, or ignorance of the greatness of the Disease, or Idleness. But if there be none of these things in the case, when we know that Mens Bodies and Diseases suffer various motions in one day, it may so happen, that you may visit a Patient when he is at the best; or when he is at worst; or in a middle state: No one of these apart does indicate what we should do, or what we may expect: Therefore the Prognostick is uncertain, and the Remedies also are uncertain. Those that are by indeed may relate many things to the Physician, but they may not mention many things, which would indicate

cate something to a Physician, for the Cure or Prognostick. But then Physicians are to blame in this frequency of visits, when they are never idle about the Patient, but always prescribing something. Thus while they would be thought officious, they do much mischief.

Borellus.

XXXIV. It is the Physicians Office not only to use Remedies but also to remove all Impediments. And all Passions of the mind are great Impediments; but especially the sick Mans Impatience, who desires that the Cure may be hastened. The Physician must therefore prevent this mischief by comforting and exhorting the Patient, to make no more haste than good speed, and to wait Nature's time. This rash and impatient thinking in sick People hinders the Cure. For while they despond because of their sense of Pain, they make their Disease worse by their very timorousness, and when they could not be conquered by the violence of the Disease, they are killed by their disturbance of Mind. And here the encouragement of the Physician does good, if he propose to the Patient that Nature is not changed but maintained by Art: and hence he will reap more benefit from his confidence, than damage from his diffidence: for the more desirous the Patient is to live, so much more easily will he be persuaded by the weakest Arguments to obey the Rules of Art, and to hope for his Health in a little time. The Physician moreover must tell him, that Health, which he endeavours to introduce, is familiar to Nature; and therefore, if he will but follow Advice, that it may be introduced without much difficulty: That he was not born with the Disease, and therefore since it is not rooted in Nature, it may the more easily be conquered.

Zwingerus.

XXXV. *Plato primo de Legibus* shews, that it is the duty of an ingenuous Physician to instruct his Patient, and not to order him, what must be done, till by informing he hath persuaded him, that it is expedient to be done. And though for this very reason Empiricks find fault with the Dogmatists (as *g. de legibus*) because a Man ought not to teach but cure his Patient. Yet they do not teach him to make him only more knowing, but upon another account, that when he does know, he may the more willingly obey. *Aristotle's* saying to a Physician is memorable: For when the Physician was ordering him what should be done, *I will willingly obey you*, says he, *but it must be in a Philosophical way, that is, if you make me not only believe, but demonstratively know, that what you say is true.*

Idem.

XXXVI. There are ten principal things concerning which Patients should be interrogated, according to *Hippocrates*, *l. de Affect.* and *Galen*, *4. de san. tuend. c. 4.* 1. What it is that ails him, and how his Head and Stomach, and other principal parts do? 2. How many days he has been ill? 3. What made him ill? 4. What Diet he kept? 5. Whether he be Loose or Costive? 6. Whether the Disease be Phlegmatick, or Cholerick, or both? 7. Whether the Disease be but be-

ginning, or in the increase? 8. Whether he use naturally to breed bad Humours? 9. Whether any Natural Evacuation be stopt? 10. Whether his Body be laborious or idle? All these Questions are so necessary to be asked by a Physician, for the Patients Health, and for the exact Knowledge and Cure of Diseases, that without asking of them a Man will scarce ever cure aright.

Ferdinand.

XXXVII. Physicians must know not only Men's Nature in general, but every Man's in particular, (the *Greeks* call it *idiosyncrasia*) and he that knows this, he may truly cure; for he is got into Nature's Closet. ¶ But this can only be obtained by Experience and singular Observation.

Tulpius.

Sylvius de le Boe.

XXXVIII. And the Physician must be admonished of this one thing further, that when he observes any thing singular in his Patients after eating this or the other Meat, that then he must diligently search and enquire the true causes of that Symptom, to the end, that when they are as exactly enquired into, as is possible, he may cure those Ails with more ease and success: For nothing recommends a Physician to a Patient so much, as the finding out of a hidden Cause, and the Artificial Cure of it, which other Physicians could not arrive at. Now when Practitioners meet with stubborn Diseases, and being taught only by Books, can find no Examples of them in Physical Authors, nor have learned how to discover the causes of them, they are at a loss, and the Patient cannot be cured, till some are called that are well exercised in the search of Arduous things, who may by their skill find them; and oftentimes they do not only successfully, but easily cure Patients, who were reckoned incurable; which, how much it must conduce to get a Physician Reputation, any one may imagine.

Idem.

XXXIX. Empiricks and all the Vulgar use comparison in Diseases, and use the like Remedies for Diseases, which they think alike. This thing hugely pleases the unskilful; for because they know few differences of Diseases, they think what are not manifestly different, must be altogether the same. But good Physicians do not so; for similitudes are much suspected by them, as they do easily impose and occasion doubting: And though at first like Diseases might be thought to be cured with like Remedies; yet they know, that many Diseases, which are very like in appearance, require contrary Cures, because they come from contrary Causes. The knowledge therefore of the Cause produces the contrary, that is, takes away all mistakes, and doubtings; As if several Men be ill of the Colick, one by drinking of cold Water, another with Wind, another with Bile; an Empirick seeing the same Disease, would use the same Cure to them all: But a Rational Physician, who finds the Causes are contrary, will give contrary things. Therefore he proceeds ill, who only considers similitudes; but well, who finds out the Cause. The knowledge of the Cause is so useful, that oftentimes the ignorance of the Cause does more

C e e e c c

mif

mischief, than the ignorance of the kind of the Disease, and of the place affected. For he is less able to undertake the Cure, who knows not whether the Colick comes from a hot or a cold Cause, than he that knows not whether it is the Stone or the Colick. And it is of more moment towards the cure of Fevers to know what kind the Humour is of which comes out, than the manner of its Fit, &c. Therefore, to know the way or method, wherein every Disease must be cured, it is of great moment, it concerns a Man to begin with finding out the Cure. Now it is hard, by Ratiocination to know the ways, that is, to invent Methods, because it is hard to find out, what the Disease is, what the cause, what the part affected, and what every Mans Nature and Custom is, and all these have their particular Indications, or Insinuations what to do, which we must consider separately, and then compare them one amongst another, subtracting the contrary and less, from the contrary and greater, more or less, as every Indication is stronger or weaker: From hence all Cure arises.

Vallesius.

XL. I make no question, but a Physician ought plainly to foretel the Patient of his Death, when he desires to know the Event of his Disease. For there are both Political and Theological Reasons, for which I think it good that the Patient should know the event of his Disease: And a Physician has no reason, to deceive his Patient, especially when he is sincere, and willing to know the truth.

Sennertus.

XLI. Patients must not always be severely denied what Nature earnestly craves. For we see that several do not recover of a Quarantine, and of other Chronical Diseases, till their Appetite is gratified. A Woman had a Malignant Ulcer about her Throat, it put her to much trouble, to swallow either Meat or Drink: Though she was not with Child, she longed for several things, as for Herrings, Flesh and Fish salted and dried in the Smoak, and other Meats hard of concoction, which though they were hard, she swallowed without any difficulty. Her Stomach loathed Emulsions of Almonds, Barly-Broth, and Flesh-Broth, and she would fast sometimes for three days, till her vitious Appetite came to her. Moreover, though what she craved was contrary to her Disease, it did her no harm: And what she loathed, though proper, it would make her reach and a little feverish.

Hildanus.

XLII. Seeing one Disease sometimes follows another as its Remedy, whether must we expect it from Nature, or procure it by Art? *Celsus, lib. 5. c. 28. scilicet. 4.* intimates that by no means it should be procured, when he writes that a Fever coming upon a *St. Antonies* Fire for one day, was a fortuitous Medicine, which consumed the Noxious Humour; In which thing he seems to follow *Hippocrates*, who discoursing of this changing of Diseases, said, *lib. 1. de morbis*, that such things came not by the skill or ignorance of the Physician, but spontaneously, and by fortuitous success. Yet because Art imitates Nature, therefore what Nature does, that also ought to be done

by the Physician. From Her moving Sweat, purging by Stool or Hemorrhoids, and doing any such thing, while she observes a due Decorum, the Physician learned to practise Physick. Wherefore in this difficulty we must say a Succession of Diseases must be procured by the Physician, that the former Disease may be removed. Therefore *Hippocrates*, *6. Aph. 15.* says, that a Vomit coming upon a long Looseness cures the Disease: Where *Galen* says, This is one Example of those things that are well done by Nature, which the Physician ought to imitate. But if it be so, why does *Celsus* call a Fever, which cures a *St. Antonies* Fire, a fortuitous Medicine, and why does *Hippocrates* write, that such things are done with fortuitous success? I answer, It is, because it is so dangerous a thing to raise a Fever; For if it happen upon a Cacochymick Body, it is in danger of being Malignant: if in a pure Body, that it may corrupt the Humours, or turn to a Hectick. Therefore we must proceed with great caution, and rather use such a Remedy fortuitous, than procured by Art: For a Fever supervening on an Apoplexy proved destructive to *Numenius* his Son.

Rubeus in Celsium.

XLIII. A Medical Sleep is a Sleep of the Diseases of Mind and Body, either spontaneous or procured by Art. For Artificial Sleep gains a Physician a great deal of credit. *G. Palm*, a Physician formerly of *Nuremberg*, knew that very well, who, they say, used to tell his Patients, that he would do them that favour, that they should rest better the night after he was called. He obtained this with Syrup of red Popy, which he prescribed that Night. I was taken with the Stratagem, and I often do my Patients the same kindness, by giving them my *Magisterium Anodynum*.

Rolsincius.

XLIV. It is not once, that I have seen Braggadocio's and Vainglorious Physicians mistaken, while some of them would disparage what their Collegues had said, and would boldly determine, that some Spots or Heat would certainly prove the small Pox or Measles, of which others were dubious. But it is better, in a doubtful case either to suspend ones Judgment, or only to answer dubiously, than rashly and without any certitude or solid conjecture, to pronounce such things in any case, as frequently fall out otherwise, and then expose poor *Suffenus* to be ridiculed by the Vulgar, who by mean tricks was aspiring to his imaginary Primacy. ¶ Certainly a Man had need of long and careful Experience, positively to determine the Disease it self, and its event.

Sylvius de le Boe.

Idem.

XLV. Whether should he make an Harangue to the By-standers, that is, may he dispute of Diseases before the Vulgar and Idiots? In general, Harangueing is unbecoming a Physician: for it gives the Patient a suspicion that the Physician would cure indeed, but that he is not able, and therefore he would supply in talk what he cannot perform by his skill. Truly to the Art of Physick (which is splendid enough of it self, when the Physician be-
haves

haves himself as he ought) there is no necessity of Starcht Discourse, which may take a great deal of pains in the History of Diseases before Fools. For Diseases are not cured by Discourse but Medicins. Therefore what *Ajax* said of himself may hold good here.

Melior sit dextera linguâ.

Zwingerus.

Hildanus.

you sowed, and I reap.

XLVII. Now I lay open a great Mystery of Nature. Transplantation of Diseases is a stupendous Remedy, whereby the Sickness of this or the other Man is transplanted, either into a Brute Creature, or into another Man, or into something inanimate. The Cure indeed seems superstitious to many. But since Natural Means are used, without the concurrence of any superstition, in Words, Characters, or Gestures, though the weak understanding of Mortals cannot always comprehend the reason of it, I dare not condemn what several have tried by Experience. In Sacred Writ I observe some hint of this Transplantation, though miraculous, concerning the Lamb in *Moses*, and the Swine in the Gospel. The chief way of Transplantation of Diseases is into Brute Creatures. Some Cure Consumptive Persons by letting them Blood in the Arm and giving the Blood to a Cock. One *Flud* an *Englishman* is reported to have transplanted a certain Mans Gout

T. Barthol.

Langius,

ch less can he do his Duty
C c c c c c 2 10

to many, if he must be at Consultations with other Physicians: for Consultations require time and Medical Study. Therefore if many be to be cured none can be lookt after, as they ought; and therefore many die.

A Castro.

L. Let not a Physician be ashamed to confess his Errors, imitating *Hippocrates*, who says, he was deceived by the Sutures, this is after the manner of Great Men, who have hopes of great things: for some Mens Spirits, because they have nothing, detract nothing from themselves. It is agreeable to a great Spirit, and one who nevertheless will do great things, to make a simple and true acknowledgment of his mistake, and especially in that Ministry, which is delivered to posterity for their profit.

Celsus.

LI. Experience is useful to Methodical or Dogmatical Physicians; because from this historical and particular Experience of Empiricks, they take an occasion of finding out a general Reason of those things that are unknown. *Hippocrates*, lib. de Præcept. has said, that a Physician ought to learn of Idiots: for these are endued with sense as well as the most learned Physician; and the Rudiments of Physick were found out by the benefit of Sense. Empiricism is useful to the Sick: for, be the Empiricks never so unskilful, because they want the knowledge of Præcepts; yet, I exhort Dogmatical Physicians, according to *Hippocrates* his Advice, lib. de Præcept. that for the Patients safety, in difficult Diseases they would not neglect the *reish*, that is, the Experience of Empiricks: For though they have not a Dogmatical Method, drawn from Histories of particulars, yet they have Experience in particulars, and sometimes cure Diseases by Empirical Analogism, though they cannot render a Reason of their Cure by a Methodical or Dogmatical Epilogism. Certainly a mere Empirick, even upon the Testimony of *Aristotle* is better than a mere Dogmatist; because he cures some, though without Art; this never cures any.

Zwingerus.

LII. There are many things in this Art, wherein for Urgency's sake, it is a piece of Art to depart from Art. For though there be many Legitimate and Regular Precepts; yet none are perpetual: And he that reckons any for perpetual and inviolable, may be a Methodist, but not at all Rational. For a Rational Physician cures not by Book or Commentary, but as Experienced Reason dictates in every affair, and he ties himself to no unalterable Rules. Nothing is more unprofitable and dangerous, than always to observe the same set form, which the less Circumspect, and they that are ignorant in many things, call Method, which yet is method only in this, that it is a short way, but it is too short. Art cannot be confined within so narrow bounds; there is need of Reason to consider all things; for in Cases there is a wonderful variety.

Vallesius.

LIII. It is the part of a Physician not only to use Medicines and all Medicinal Instruments aright, and to order the Meat and Drink; but also to take care of all things that must

be done or said before the Patient, by himself or by any body else, and of the Chamber, Houle, and Bed, and of all External things, and to dispose of them all, as may make most to please and benefit the Patient. *Hippocrates* calls this Providence, *the Oeconomy about a sick Person*, properly enough: For when he orders Bleeding, or Purging, or the applying of a Plaster, or any such thing, he seems to exercise his Art of Physick: But when he orders the Windows or Doors to be opened, or shut, the Patients Bed to be removed this way or that, that they who come to see him talk of such or such things, that this be told him, and the other thing be concealed from him, he seems to exercise a kind of Oeconomy. And indeed though the first care, which belongs to the Medicinal Instruments, be of most moment, yet the last is of no small concernment. Certainly many excellent Physicians, and well skilled in their Art, because they are a little awkward about this Oeconomy, are so ingrateful to their Patients, that for this very reason they are laid aside as useless. On the contrary, others that have little skill, do so accommodate themselves to this Care, that though they do no great feats, yet many think them excellent Physicians.

Vallesius.

LIV. The Physician must not visit his Patient beyond the twentieth day, if he recover; unless he be intreated to assist him in his Recovery. So when he has a mind to take leave, he must cunningly enquire, whether there be any thing, that still requires his coming; for it does not become a prudent and grave Physician to tarry till he is bid to come no more.

A Castro.

LV. Many Physicians avoid all days of the Conjunctions and Oppositions of the Moon: Some to this Superstition do add many other unhappy Aspects. And it is plain, that all of them will not begin a Cure on those days, and that they make an intermission of the Cure on them, if they have begun it. *Hippocrates* indeed condemns fifty days about the Dogdays, and twenty about each Solstice and Equinox, ten before and so many after, and the rising and setting of the *Pleiades* and *Arcturus*, l. de Med. Purg. and l. de Aer. Aq. & Loc. I think it more Medical and prudent Advice, to have a care of the great and various Intemperature of the Seasons, laying aside all care of the Stars. Nor indeed can I think that those Physicians named the Stars upon any other account, than as they are signs of the Alteration of Seasons. The Dog of great heat, *Arcturus* and the *Pleiades*, and the four Points of the Zodiack, of sudden Alterations. A Physician therefore may observe the Alterations of the Air, and reckon they only belong to his Art. I only regard these Aspects of the Moon, when it makes not much matter whether you give or defer your Remedy: Complying so far with other Mens opinions, as to call it the Least Indication.

Vallesius.

LVI. It is found by Experience that every seven or nine years a Man undergoes some great alteration. These years are called Climacterick, because they are Steps or Ladders by

by which we climb up to old Age. In these years *Gravus in Horstius, tom. 2. p. 492.* dissuades the use of great Medicines, or as *Mermannus* calls it, the *Therapia Magna*. For, as wise Physicians do nothing on Critical Days, but leave Nature to her self: So in these years, since Nature for the most part uses to do some great thing, the Physician must be quiet.

Hæserus.

LVII. Whether are there any Universal Medicines, as is written of *Butler's Stone* (See *Fr. Hofmanni A. Pharm. l. 2. c. 65.*) which cured most, if not all Diseases with a touch of the Tongue only, using a few more Circumstances? We do not deny *Helmont's* Opinion, that Scents have an immediate contact with the Spirits, and can do much in exciting the *Archeus*. But whether by this very illinition with such a Stone of *Ens Veneris*, &c. the *Archeus* can be so strengthened as to avert all occasional Causes, is a great *Postulatum*, and can hardly be granted.

Wedelius.

LVIII. Whenever the Physician judges some generous Remedy requisite, and the Patient or By-standers are against it; he ought to shew the great danger present, the mischief of deferring or omitting it, and then impute all the damage that will follow, to their refusal. Thus they that will not yield to persuasions, will obey for fear of future evil. Now the Physician that neglects this Rule does not only neglect his Patients but himself; His Patients, because when they flinch for a little pain or trouble, he does not threaten them with the danger, and so force them in a manner to obedience: He neglects himself, because when things go ill, all the blame devolves on him; and he is accused of want of skill, as not foreseeing the mischief that would follow; or of negligence, in not reducing the Patient to his Duty with greater heat and earnestness, who is excusable, for the pain he was to undergo.

Sylvius de le Boc.

LIX. I have often thought with my self, that we cannot make too little haste in driving away of Diseases; but that we must proceed slowly, and that more should be left to Nature than is now the custom to do. For he is in a Mistake, and that no very learned one, who thinks Nature always needs the help of Art. For if it were so, she had not taken that care of Human kind, which the conservation of the *Species* requires; Since there is no proportion between the frequency of Diseases that invade Men, and the faculties, which Men have, to drive them away, even in those Ages when Physick flourished most, and when most Men practised it. What this will do in other Diseases, I know not, this I know very well from the concurrence of diligent observation, that in the Fever, whereih the *Stupor* prevailed, after general Evacuations were used, Bleeding, and Clysters, the said Symptom used only to be cured by Time.

Sydenham.

LX. Where the nature of the Disease is obscure, yet as for the Cure, an Indication is left us to be taken from the *Juvantia* and *Leidentia*, by means whereof, trying the way by degrees, we may conduct the Patient out of

danger; provided, we make not too much haste; than which haste, I think nothing more destructive, nor that more Patients die of any one thing. For I am not ashamed to confess, that when I was not satisfied what I ought to do, I provided best both for my Patient and my self by doing nothing: For while I waited my opportunity to kill the Disease, the Fever either went away by degrees of it self, or put on such a Type, that then I knew well enough, with what Weapons to conquer it. But, which is to be lamented, most Patients not fully knowing that it is as much the part of a skilful Physician sometimes to do nothing at all, as at another time to give the most effectual Remedy, are not capable of the benefit of this honesty and faithfulness, but impute it either to negligence or ignorance, whereas the dullest Empirick, knows well enough how to give Medicin upon Medicin, and usually does it more than the Wisest Physician.

Sylvius de le Boc.

LXI. I had rather make use of an Empirical Physician, that is, one who practises according to Experience, than a Theoretical one, who practises according to his Reasonings and Figments. For Experience has long since informed all Accurate Observers of things which happen in our Art, that Empiricks are more successful in their practice than Theorists, and such as are Physicians from Books, or their own Speculations; Men so much more miserable in their folly, because they make others miserable with themselves. But the World will be bubbled with Cramp Words, and great Brags.

Idem.

LXII. As in the knowledge of all Arts Reason and Experience are very necessary; so in Method one cannot be without the other. Reason indicates, what must be done; Experience confirms, what Reason has invented, and teaches to work exactly according to Art. Yet all things are not found either by Experience alone, or by Reason alone. *Gal. 3. m. m. 1.* Although Reason alone, invents some things, and Experience alone produces others, yet always, as much as possible, Experience and Reason must be joined, as two Crutches on which Physick leans: So that in Theoremes, or in Medicines found out by Reason, Experience must follow; on the Contrary, in such things as were found out by Experience, Reason must come behind, *2. Meth. cap. 6.* Let them be so connected and fastened one in another, that one may strengthen the other. For no Reason can be true, which is contradicted by Experience, nor on the contrary; That is, they must both be true, and the things that are found out by them; But when they thwart one the other, of necessity either the Experience must have been inartificial, or the opposite Reason must only be apparently true, whereon we must not rely, nor for it must we depart from our Senses and Experience. And therefore there is no Reason without Experience; both Experience without Reason is invalid, and Reason without it is fallacious and captious: Though the Preheminence between them two

is doubtful. For Experience knows few Diseases, and those which come often and frequently: But Reason does as well help rare Diseases, which it never saw before, as common ones, because it searches out the Natures, Differences, and Causes of all by Discourse and Ratiocination, or it comprehends things by Scientific Knowledge, or at least by Artificial Conjecture, yet by a sure one, and that which is next to Science. Besides, Experience only acquires those things which often happen in the same manner; and seeing all the simple and compound Diseases of all parts, Similar and Organick, cannot be brought together, it is impossible that there can be Experience of them all, but only of the frequent ones; and therefore it of itself does not comprehend or reach either the knowledge or Cure of several Diseases. Besides, some frequent Diseases come without any concurrence of Symptoms, and cannot be known, but by conjecture and a Tentative Cure, and therefore in this way of proceeding only Reason can obtain the knowledge which is sought after; And Experience not knowing the power of the trying Remedy, joyns and compares it with the following operation, and thence it easily guesses, and it gets as much knowledge of the Disease by things hurtful, and orders the whole Cure: But not that Experience, which knowing not the virtues of Remedies, takes any thing for the Cure without judgment, so that if the business succeed not at first, he knows not whither he must go, but by blind Chance and Fortune runs to another thing. But however it is, that Reason dictates these and the like things to us; yet Experience is very necessary, as in order of Nature it deservedly goes before Reason, since Physick was not found after Reason, but Reason after Physick. Though Reason will not yield to Experience in dignity; yet in the mean time lest Reason should halt, let a Man stand on Experience, which is the other Leg, and this is often of it self sufficient. For what things, says *Sennertus*, *Inst. lib. 5. p. 1. c. 22.* fall under our sense, leave nothing in doubt, nothing in question; but since some things are hidden to the senses, we must endeavour to bring them under Reason; yet so as not to infer confused and infinite things, nor fetch the principles of our demonstrations from far. And when what is found by Experience, can be proved by Reason, without doubt it is very certain. But when Reason opposes, we must rather adhere to Experience, yet this must be of a skilful Physician, sure and undoubted; for if it be uncertain and bad, it tends to the destruction of the whole Man; Wherefore *Hippocrates* said, *6. Epid. 2. 29. A Physician must experience nothing rashly.*

Hofman.

LXIII. Seeing *Hippocrates*, in reckoning up the Critical Days in Diseases, followed the common custom, calling all that time, from which the Patient began to be sick till Sun-setting, the first day, and taking the other following to begin at the rising, and end at the setting of the Sun, we ought not to depart from his way of Computation. For though *Galen* make every day to consist of about

twenty four hours, he was neither taught it by his Master, nor did he it, as convinced by Experience; but because he could no way else assign a Reason of Critical Days. But because this way of Computation taken from *Galen* is commonly observed; that this Abuse in a thing of so great moment may (if possible) be removed from the Medical Faculty, I shall dwell a while upon this subject.

First therefore I shall shew, that this Computation of *Galen's* is not according to the mind of *Hippocrates*, who used to commence every day, expecting the first from the Sun-rising. Then I shall try to give the true Reason of *Hippocrates* his Computation, and assign a cause, why the first day, though it be not a whole one, yet ought to be reckoned for one day.

Let us therefore fall upon the first. If *Hippocrates* had had a mind that the enumeration of each day should have been made, by beginning the day always from the hour when the Patient fell sick, he must needs have told the hour when the Disease first took the Patient, seeing the whole course of the Computation has its original from thence. But in reporting the Histories of Patients he nowhere makes mention of the hour of the invasion of the Disease: A most evident Argument, that it is not necessary to know this, seeing it is sufficient not to be ignorant, whether the Disease begun by day or night, or evening, morning, or midday; because the computation of Days must be made, not beginning at the hour when the Disease came, but from the time, when the natural day does truly begin. And it is plain, that this was inviolably observed by him, because in reckoning up those things, which happened every day to the Sick, he reckoned the morning and evening in the same number, as one day only, not part of the day as the end of the preceding, and the other part as the beginning of the subsequent day; as the *Galenists* do. You may see this in the History of *Philiscus*, registred *1. Epid. n. 1.* where he says, that the third day in the Morning he seemed free from his Fever till Noon, in the Evening he had an Acute Fever, &c. We may observe the same in the History of *Epicrates* his Wife, and also of *Dromeas* his Wife, described in the same place: As also in the description of the Phrenitick Disease, of which *3. Epid. 5. 3.* and of the Servant in a Victualling-Houle, *lib. 4. v. 126*; and yet more clearly in the History of *Pinion*, *l. 3. f. 3. v. 134.* and in several others in *lib. Epid.*

Which Histories if these Men were to describe, they would divide every day into two parts, joining the former with the preceding day, and they would make the Evening the beginning of the day following: Which you nowhere find done by *Hippocrates*, who always ranked the Morning and the Evening in the same number, beginning the day always, as has been said, with the Sun-rising, and ending it with the Sun-setting. Will any of them say, that all *Hippocrates* his Patients began to be sick at Sun-rising, as he has begun the

the enumeration of his days from thence? Certainly this is ridiculous, since Experience shews, that Diseases do very seldom begin in the morning.

Since therefore *Hippocrates* never observed this division of days in his Enumeration, it is certain that the way of computing days by twenty four hours which *Galen* invented, and Posterity has followed, is a mere Figment, and to be rejected from *Hippocrates* his Doctrine: And that that way of computing must be observed, which *Hippocrates* followed, calling all that time, which is between the first coming of the Disease and the setting of the Sun, the first day, beginning the second, and all the rest from Sun-rising till the night following, according to the common custom, which usually makes it a day from the rising to the setting of the Sun.

Nor must we believe that *Hippocrates* in writing would have been so negligent in a matter of such moment, if the Computation must have been made different from the common custom, as not to have expressed it. Since therefore such was our Master's Enumeration of days in Diseases, upon which the whole Reason of Prediction and Cure is founded, though the true cause of it be not known, yet I will try to give as probable a Reason as I can, not departing from *Galen's* Principles, who 3. *de dieb. decretor.* endeavouring to give a Reason of Critical Days, reduced it to the passing of the Sun through the Signs of the Zodiack in Chronical Diseases, but in Acute Diseases, to the motion of the Moon. Now whether its Action proceeds from the Signs which it runs through by its proper motion: Or from the diversity of Light, which it receives from the Sun: Or from the concurrence of both, it is not our business to determine, since it is sufficient for us, to know that the changes of Acute Diseases do proceed from the motion of the Moon by Quaternaries and Septenaries.

But though upon account of the foresaid motion of the Moon, *Crisis* and other alterations of Diseases ought to be at certain set days and hours, when it touches this or that point; yet often the Rational time is missed, so that sometime it anticipates, sometime it postpones, and chiefly by reason of the Fits, which seldom coincide with the said motion of the Moon. For it is certain, that *Crisis* are made in the day of the greatest Fit, wherefore we see (which *Hippocrates* also observed) that those Diseases are judged on odd days which are moved on odd days; but on even days, when their Fits come on even days, and at a particular time of them: for in the beginning of the Fit Critical Excretions are made upwards: And what are made downwards or by Sweat, do come when the height of the Fit is over.

If therefore the peculiar time of the *Crisis* depend upon the variety of the Fits, the cause must be enquired of the Repetition of the Fits at certain set hours, because this same, with the foresaid motion of the Moon, will make both the *Crisis* and other alterations of

Diseases. And certainly this can be no other than the motion of the Sun which makes the day it self and measures it, while being rapt by the *Primum Mobile* from East to West in twenty four hours time, it views the whole World. For by means of this motion, not only day is distinguished from night, from the diversity whereof Human Bodies and all Sublunary things are variously affected, but also when it comes at the four Cardinal Points of the World, it produces an Alteration in these inferior things, answering in proportion to the four Seasons of the year, whence it comes to pass, that as in Spring Blood abounds most, in Summer Bile, in Autumn Melancholy, and in Winter Phlegm, so in the Morning Blood is naturally moved, at Noon Bile, in the Evening Melancholy, and at Night Phlegm, as is generally held by all Men. Wherefore since the beginning of a Fit is nothing but the beginning of the motion of the Humour, which peculiarly either causes or feeds the Disease, we must needs maintain, that that is the beginning and author of the Fits, from whence the beginning of the motion of the Morbifick Humour proceeds. For the reason, why the Fit, for example, of a Tertian Ague, returning every third day, comes at a determinate hour, is because the Sun, coming to the Meridian, disturbs the Bile, which is the Matter of a Tertian Ague, which when it is prepared to receive the Febrile heat, upon occasion of that agitation, it begins the Fit. And if the Fits of Tertians do not always come at Noon, nor turn at the same hour; for sometimes they anticipate, sometimes they postpone, it must be attributed to the inobedience of the Matter, because either by reason of its abundance, or of its quality, or of some mixture of another Humour, it either does not presently give way to the moving cause, or it is over hasty.

If therefore the time of the *Crisis* be governed by the time of the Fit, and the cause of the Fit be the foresaid motion of the Sun, as by it the Sun coming to such or such a Cardinal point of the World brings the Fit at this or that hour, it follows oftentimes, before the Moon come to that Point, by whose virtue the *Crisis* happens on this or that day, that the *Crisis* happens by virtue of the Sun, who measures and disposes the hour of the Fits, and by consequent the hour of the *Crisis*: So that it is not necessary to a *Crisis*, for example, which happens on the seventh day, that all the days should consist of full twenty four hours: Since it is sufficient when the Sun having been seven days above the Earth, has exercised its virtue upon the Humours, that the *Crisis*, or any other mutation may be said to be on the seventh day. Therefore, will some say, the *Crisis* will not be caused by the motion of the Moon, but rather of the Sun, if by virtue of the Sun a *Crisis* follow, before the Moon come at the place of the *Crisis*. I answer such, That for the *Crisis* to be made on this or that day depends on the motion of the Moon, who although she be not yet come to the exact point

point wherein the *Crisis* ought to be made; yet she has introduced before that time such a disposition into the Body and the Humours, that upon the approach of the action of the Sun a *Crisis* may be made.

Wherefore the virtue of the Sun is to raise a *Crisis* at this or that hour, but of the Moon, on this or that day: For the Stars do act upon these inferior things not all on a sudden; nor then only when they touch such a Point; but they begin to act much sooner at a certain distance, that is, when by their Orb or Ray they come near that Point, and so much the more effectually, by how much the nearer they approach to that Point, where their efficacy is strongest. Wherefore when the virtues of two Stars concur to one and the same Action, it is not necessary that the utmost virtues of them both, which consist in the Point of an Aspect (Astrologers call it a Partile) should concur, since the efficacy of one may be a cause, that some disposition introduced by the other, may be sufficient to produce the Effect. Whence it comes to pass, that the Action which proceeds from the Sun, does often produce a *Crisis* or some other Affection in the Body, though the Moon, which concurs to that Affection, be not yet arrived at the place on which its Action depends. And therefore, as I said but now, it is not necessary, that all the days should consist of full twenty four hours, as for Example, if one be taken sick about the twentieth hour, on Sunday, although the Moon before the fourteenth hour of the Saturday following come not to that point, which makes the beginning of the seventh day, which indeed is, when the Moon by his Ray or Orb is come to that place, which by a square Aspect respects that Point, in which she was at the time of the coming of the Disease, by virtue whereof *Crisis* and various Mutations in Diseases do happen; nevertheless by virtue of the Sun, which moves and makes brisk the Humours at some set hours, the effects of the seventh day begin at its rising: Since the disposition is sufficient,

which the Moon, approaching the place of Aspect, introduces into Mens Bodies: So that if the Disease be with a predominance of Blood, a *Crisis* may be made by Hemorrhogy even on Saturday morning at that hour when by virtue of the Sun the Blood is briskest and moves most.

Whenever therefore any one is taken with a Disease, while the Sun is above the Earth, we must compute all that time to the Sun-setting for the first day; because the Sun-setting ends the day and begins the night, which two things are quite contrary one to the other in virtue and nature. Whence it is, that whatever follows afterwards, has nothing to do with the former day, but belongs to the subsequent, of which that time is part. And this proceeds from the faculty of the Sun, which constantly exercises its virtues every day and finishes them, when it is come to the setting: and it begins to produce other effects, when it gives beginning to another day. And it appears from this, that if the day be like to be quiet, the night preceding is usually quiet; if the day be laborious, the night before is troublesome. Wherefore hence it may be argued, that in computation of nights the preceding must be reckoned to the day following. Although Hippocrates have not determined this matter, yet it is probable: for we are taught in *Genesis* that the night begins the day, when the Author says, *And the evening and the morning were the first day.*

I judge Critical days should be computed after Hippocrates his way, who means natural not artificial ones. If you reckon Galen's way, the *Crisis* will fall sometimes on the sixth, sometimes on the eighth: Therefore they err who follow him, and they often kill; as it happened to a famous Physician, who on the fourteenth day in the morning ordered Cupping-Glasses to be set to the shoulders with Scarification, and by that means he stopt a *Crisis* by Urine, which was just coming, upon which the Patient died on the one and twentieth day; because he checked the *Crisis* on the fourteenth.
